PREFACE.

THE most exciting event of 1895, in this quarter of the world—and it may yet prove to be the most important—was the declaration by our Government of a purpose to apply the Monroe doctrine to the boundary dispute that has been going on so long between Great Britain and Venezuela concerning the westward extension of British Guiana. Whether the English claim is honest, or is merely an expression of the cupidity excited by the discovery of rich gold fields in eastern Venezuela, is a fair subject for discussion, and its examination will be greatly assisted by the history of the case in our article on "Venezuela" and the accompanying colored map. The assertion of the Monroe doctrine, with its possible results, naturally brings the inquiry, What have we to rely upon in case of sudden war? and this is answered in large part by the article in this volume on the "National Guard," which has been compiled carefully from official sources and shows the strength of that organization in the several States and groups of States. It is illustrated with portraits of some of the best known of the commanding officers. For information as to actual wars waged in 1895 the reader will turn to the account of the Italian advance into Abyssinia, that of the British advance in Afghanistan, and the rebellion in Cuba.

Turning from the contemplation of war to the arts of peace, we have an important article on "Manufactures in the United States," which shows the capital invested, the cost of material, and the value of the product, in 165 cities, wherever the capital in any one industry exceeds \$200,000.

The progress of science is recorded in the articles "Associations for the Advancement of Science," "Astronomy," "Chemistry," "Metallurgy," "Meteorology," "Physics," and "Physiology," all of which are freely subheaded, so that the reader can readily find the specific subject in which he is interested. For matters mechanical rather than scientific the articles "Bicycles," "Engineering," "Horseless Carriages," and "Patents" may be consulted.

The articles on the Dominion of Canada and the separate provinces, written by a native Canadian from direct information, will be found unusually full and interesting. And beyond Canada is our own Alaska. Material is not available for an article on this Territory every year, but in the present volume we present one from the pen of Prof. Russell, of the University of Michigan, who has studied the subject on the ground.

The articles on the great religious denominations will be found full as usual, and that class this year includes also some on the smaller and less known organizations, such as "Christian Endeavor," "Congress of Free Churches," "Evangelical Association," "Independent Roman Catholic Church," "Reunion of

Christendom," and "Reorganized Church of Jesus Christ of Latter-day Saints." The progress of humane work is indicated to some extent by the articles on "Dog Shelters" and "Peace Societies," while the opposite tendency may be read in the story of the atrocious massacres in Armenia, as set forth in the article "Turkey."

The article on the Congress of the United States, setting forth the acts and debates of the short session, covers the subjects of the Currency, the Bond Question, Silver Coinage, some Japanese matters, Hawaiian relations, the Seal question, Copyright, Lotteries, Military Parks, the Nicaragua Canal, and others. And for what took place in our monetary centers the "Financial Review of 1895" may be consulted, while minor happenings are briefly chronicled under "Disasters" and "Events." The annual record of the Fine Arts is contributed by John D. Champlin, author of the "Cyclopædia of Painters and Paintings," and there is a rapid review of the year's publications in the three Literature articles. The article "Gifts and Bequests" presents a gratifying record.

The most notable of the special articles in this volume is that on the "Cotton States and International Exhibition," held in Atlanta, Ga., which is illustrated with a map and seven views. Other special articles are those on "Elks, Order of," "Football," "Félix Faure," "Irish-American Alliance," "Oleomargarine," "Polish Alliance," "Search Light," "Sloyd," and "West Africa."

The death roll of 1895 is notable. The scientific world suffered the loss of Huxley in England, Pasteur in France, and Dana in our own country. Our losses of clergymen include Edward Beecher, John A. Broadus, Arthur Brooks, O. B. Frothingham, Alonzo A. Miner, John G. Morris, Samuel F. Smith, and William M. Taylor. In art we lost Charles B. Atwood, Edwin Forbes, M. F. H. de Haas, Thomas Hovenden, Peter F. Rothenmel, William W. Story, Calvert Vaux, and Leonard W. Volk; of our authors, H. H. Boyesen, Eugene Field, and Charles Étienne Gayarré; of our educators, James R. Boise, Charlotte Emerson Brown, Norman A. Calkins, Henry A. Coit, Henry Coppee, A. C. Kendrick, Charles Northend, Julius H. Seeley, and John M. Waddell; of our jurists, Walter Q. Gresham, Ebenezer R. Hoar, William Strong, and Allen G. Thurman; of our soldiers, Joseph B. Carr, Philip St. George Cooke, Richard Irving Dodge, Michael T. Donohue, Augustus V. Kantz, Erasmus D. Keyes, and John Newton; of our composers, Harrison Millard and George F. Root; and of our orators, Frederick Douglass. Among the notable names in the European necrology are those of the statesmen Lord Aberdare, Lord Randolph Churchill, Nicholas Giers, Jules St.-Hilaire, Count Taaffe, and Stambuloff; the soldiers Sir Patrick Grant, Marshal Canrobert, and Archduke Albrecht; John Bell, the sculptor; Sir Roundell Palmer, Sir Henry Rawlinson; the authors John Stuart Blackie, Alexandre Dumas, Gustav Freytag, Frederick Locker-Lampson, John R. Seeley, Heinrich von Sybel, and Stepniak. In philanthropy we have lost Linda Gilbert, and England, Emily Faithful. Sketches of all these and many more, with numerous portraits, will be found in this volume.

The book closes with an index covering the twenty volumes of the series.

NEW YORK, April 2, 1896.

CONTRIBUTORS.

Among the Contributors to this Volume of the "Annual Cyclopædia" are the following:

Oscar Fay Adams,

Author of "Handbook of American Authors."

FROTHINGHAM, OCTAVIUS BROOKS,
GAYARRÉ, CHARLES ÉTIENNE,
LOCKER-LAMPSON, FREDERICK,
PALMER, ROUNDELL,
SEELEY, JOHN ROBERT,
STORY, WILLIAM WETMORE,
and other articles.

Mrs. Florence E. Angle.

OKLAHOMA,
WASHINGTON (State),
and other articles.

Marcus Benjamin, Ph. D.,

Editor of department of chemistry in the "Standard Dictionary."

ASSOCIATIONS FOR ADVANCEMENT OF SCIENCE,
HUXLEY, THOMAS HENRY,
PASTEUR, LOUIS,
and other articles.

J. H. A. Bone.

OHIO.

Arthur E. Bostwick, Ph. D.,

Associate Editor of "Standard Dictionary."
PHYSICS.

Hon. Jacob V. Brower.

HILL, ALFRED JAMES.

Thomas Campbell-Copeland,

Author of "The Ladder of Journalism."
MANUFACTURES IN THE UNITED STATES,
NATIONAL GUARD.

James P. Carey,

Formerly Financial Editor of "Journal of Commerce."
FINANCIAL REVIEW OF 1895.

John Denison Champlin,

Editor of "Cyclopedia of Painters and Paintings."
FINE ARTS IN 1895.

Hon. Benjamin F. Clayton,

President of the Farmers' Congress.
FARMERS' CONGRESS.

Mrs. Bessie Nicholls Croffut.

EXPOSITION, COTTON STATES AND INTERNATIONAL,
LITERATURE, AMERICAN,
LITERATURE, BRITISH,
RILEY, CHARLES VALENTINE.

Austin E. Ford,

Editor of "Freeman's Journal."

ROMAN CATHOLIC CHURCH.

Mrs. Fredericka B. Gilchrist,

Author of "The True Story of Hamlet and Ophelia."

ARKANSAS,
IDAHO,
NEW JERSEY,
NEW MEXICO,
PROTESTANT EPISCOPAL CHURCH,
SOUTH DAKOTA,
WISCONSIN,
and other articles.

Rev. William E. Griffis, D. D.,

Formerly Professor of Physics in the University of Tokio.

JAPAN.

KOREA.

George J. Hagar,

Editor of "Columbian Cyclopædia."

ALABAMA,
CONNECTICUT,
FLORIDA,
GIFTS AND BEQUESTS,
KANSAS,
OBITUARIES, AMERICAN (in part),
TEXAS,
VIRGINIA.

Rev. Moses Harvey,

Author of "Text-book of Newfoundland History."

NEWFOUNDLAND.

Ripley Hitchcock,

Author of "Fishing in America."

HAAS, MAURITZ F. H. DE.

Benjamin B. Hoffman,

Author of "The Sloyd System of Wood-Working."

SLOYD.

J. Castell Hopkins,

Author of "Life and Work of Mr. Gladstone."

CANADA, DOMINION OF,
and articles on the Canadian provinces.

Abram S. Isaacs, Ph. D.,

Editor of "Jewish Messenger."

JEWS.

THE ANNUAL CYCLOPÆDIA.

A

ABYSSINIA, an empire in eastern Africa. The reigning emperor, called the Negus Negusti, is Menelek II., King of Shoa, who established himself on the throne in 1889, with Italian aid, as successor to Johannes II. By a treaty made by him on May 2, 1889, and confirmed in the following October, Italy acquired a nominal protectorate over Abyssinia, and this country is recognized as within the Italian sphere of influence in conventions made with Great Britain, and has been acknowledged to be so by Germany; but the Negus has since repudiated or denied the agreement, and both Russia—which, as protector of the Alexandrian Church, claims to have especial interest in this country—and France have refused to recognize the Italian protectorate.

The people cultivate a degenerate form of Christianity. The head of the Church, called the *abuna*, is chosen from among the Coptic clergy of Egypt by the Patriarch of Alexandria. Education is conducted by the monks and priests, who instruct a small proportion of the youth in religious music, grammar, poetry, and the Scriptures. The people raise cattle, goats, and sheep, but do not till the soil much. Indigo, cotton, and coffee grow wild, and timber and forest products are abundant. The chief exports are skins, ivory, butter, and gums. What foreign commerce there is passes through the Italian port of Massowah.

The territories administered by the Italian authorities are: The seaport of Massowah and the surrounding district, with Keren and Asmara, elevated districts where the troops are quartered, having together an area of 3,100 square miles; the Dahlak peninsula, 420 square miles, where pearls and pearl shells are gathered for export; and Assab, with an area of 580 square miles. The protectorate includes the empire of Abyssinia proper, consisting of the kingdoms of Tigre, Lasta, Amhara, Gojam, Shoa, with Kaffa, Harrar, and other territories, having a total area of about 190,000 square miles and 5,000,000 inhabitants; the territories of Habab, Bogos, Beni-Amer, Danakil, and the sultanate of Aussa; and Gallalad and the part of Somaliland conceded to Italy in the Anglo-Italian agreement of March 24, 1894. The total area recognized as under Italian influence is about 546,100 square miles, with 6,258,800 inhabitants.

The territories that have been brought under Italian jurisdiction are organized as the colony of Erythria or Eritria, which has for its seat of government the town of Massowah, containing 7,775 civil inhabitants, of whom 600 are Europeans and 480 are Asiatics. The area subject to Italian administration is 96,200 square miles, having a population of 3,452 Europeans and 191,127 natives, mostly nomads, who raise cattle, camels, sheep, and goats. There is a civil governor, appointed by the Italian Government. The military and naval commanders are independent of him, receiving their instructions from the Italian Ministry of War. The revenue and expenditure of the colony for 1894-'95 were estimated each at 9,212,117 lire, of which 1,448,000 lire were raised by local taxes and dues, and 7,764,117 lire were contributed by the Italian Government, which had expended 123,827,315 lire upon its African possessions from 1888 up to the end of 1892. Much of the trade of the country is carried on by Banians, who are British Indians. The imports of Massowah by land and sea in 1893 were 9,863,829 lire. A military railroad, 17 miles long, connects Massowah and Saati, and a telegraph line of 319 miles communicates with Assab, where it connects with one of 62 miles running to Perim. Massowah is also connected by wire with the military stations on the plateau of Keren, and a telegraph has been erected from Agordat to Kassala.

Fighting in the Soudan.—The walled city of Kassala in the Soudan was occupied by Gen. Baratieri, commander in chief of the Italian forces, in July, 1894, after he had administered a crushing defeat upon the dervishes and driven them across the Athara. The place was fortified, and a garrison of 1,500 men was left there. In the winter a formidable body of dervishes laid siege to the town. Re-enforcements were sent from Agordat, and the friendly emirs of the district joined with the Italians in expelling the invaders.

Italian Advance into Tigre.—At the time when the dervishes appeared before Kassala Ras Mangascia, the Governor of Tigre, with an army of 10,000 men, moved toward Coatit with the evident intention of occupying the mountainous country of Ocule Kusai and beginning operations against the Italians from that vantage ground. Menelek had for some time been

supplying himself with arms and ammunition obtained from French merchants at Obok. Gen. Baratieri, who was at Asmara, decided to intercept Ras Mangascia at Coatit before he could enter the highlands. By a rapid march he gained a position on both sides of the road that the Abyssinians would have to take. His forces numbered 3,544 men, of whom 3,146 were native troops commanded by Italians. On the morning of Jan. 13, 1895, the two armies came into collision. The Italians opened fire with their artillery, to which the Abyssinians replied by a general advance. Gen. Baratieri was compelled to bring all his reserves into action to repel a flank attack on the left, before which the irregulars posted there gave way, endangering the line of retreat to Coatit. A vigorous counter-attack in front drove the Abyssinians across a ravine and held them in check while the line was being re-established on the left. The Tigrins returned to the attack on the Italian position repeatedly till night fell, and were repelled every time with severe losses.

The Italian commander had disposed his troops for a general attack on the following morning, when Ras Mangascia broke up his camp and began to retreat. The entire Italian force followed in pursuit, and overtook the enemy in the evening at Senafa, occupying the heights before the Abyssinians were able to form for attack. Two detachments took position on the right and the left to prevent a flank attack, while the guns poured shot and shell into Ras Mangascia's camp, inflicting heavy losses. The Abyssinians were seized with terror, and during the night the whole army fled, abandoning arms, ammunition, food, transport animals, and camp furniture. In the first day's fighting the Italians lost about 400 men, including 3 European officers; in the second battle they lost not a man. Ras Mangascia fled to the south, and his army broke up completely. The chieftains and priests of the country offered their friendship and submission to Gen. Baratieri, who returned after a few days to Asmara with the main body of his troops and dismissed the militia, leaving small detachments of regulars to garrison Senafa and Coatit.

The Italian Government consented, after this victory, to the continued occupation of a part of Tigre, and sent out 5 battalions of infantry and 3 squadrons of cavalry, admonishing the general not to extend his operations or to occupy territory beyond the necessities of defense. The measures to be taken were left to the discretion of the commander, who, after the re-enforcements arrived, set out with a strong force to occupy as much of Tigre as he considered necessary to hold the colony against a combined attack of Ras Mangascia and Menelek. He took possession of Adigrat on March 25, and fortified the town. Later he occupied Adowa, the chief town of the province. Ras Mangascia retired southward to seek aid of Menelek, and Gen. Baratieri, expecting war with the Abyssinian emperor, obtained from Italy several thousand rifles with which to arm native allies.

International Relations.—The Russian Government is the only one that has constantly refused to recognize the Italian protectorate over Abyssinia. The Russian Czar has assumed

the rôle of a protector of Abyssinian independence on the ground of the primacy of the Russian Church, of which he is the head, among the Churches of the Alexandrian creed. France disputes the Italian protectorate, moved by her *entente* with Russia and her hostility to the triple alliance. She denies especially that Harrar lies within the Italian sphere, because by an agreement with England the independence and inviolability of Harrar was affirmed, and French commercial interests demand that that independence be preserved. In May, 1891, overtures were made by the French Government toward a recognition of the Italian influence and protectorate over the whole of Abyssinia and over Harrar with the exception of Lake Assal and the surrounding region, which the Italian Government agreed to concede to France subject to certain conditions regarding freedom of trade in the salt coming from the lake. This proposed arrangement came to naught, as France broke off negotiations on account of the renewal of the triple alliance. The French and the Russians sustained the claim of Menelek that he abrogated in due form the treaty of Ucciali, in which he accepted an Italian protectorate, by denouncing it on May 24, 1894, before the expiration of the stipulated period.

The treaty arranged between Menelek and Count Antonelli contained no provision establishing the full protectorate asserted by Italy and recognized by England and Germany. The Italian text, indeed, said that Menelek should treat with foreign powers through the medium of the Italian Government, but the Amharic text merely stated that Abyssinia might make use of the Italian Government as an intermediary. When Menelek, after he had been seated on the throne with the assistance of Italy, first disputed the significance attributed to the treaty of alliance by Italy, Antonelli was sent to arrange the matter. A new convention was agreed to, regulating the boundary between Erythria and Tigre. The clause providing for an Italian protectorate Menelek would not accept, and Antonelli broke off diplomatic relations.

In January, 1895, a Russian scientific expedition set out for Abyssinia at the expense of the Geographical Society of St. Petersburg. The leader was Lieut. Nicholas Leontieff, a celebrated traveler. The party was accompanied by a Russian archimandrite, who was charged with a religious mission by the ecclesiastical authorities. Proceeding by way of Constantinople, Cairo, and Obok, through Harrar, the Russian emissaries reached Menelek's capital, where they received a cordial welcome. The religious mission was, by persuading the Abyssinians of the historical and doctrinal affiliation of the Russian and Coptic Churches, to bring the ecclesiastical authorities of the two countries into communication with each other and counteract the propaganda of the Roman Catholics, who have endeavored to convince the native Christians that their creed was identical with the Roman in essential points—viz., the sacrifice of the mass, the seven sacraments, and the reverence paid to the Virgin Mary and the saints. When the Russians returned to their own country, in June, the Negus sent with them an Abyssinian embassy to the Czar, consisting of his cousin Damto as en-

voy extraordinary; with Belyako, the King's nephew; Geneml, a general; and the bishop or chief priest of Harrar. In Russia the members of the mission were entertained in a way to impress them with the power and magnificence of the Czar, and especially with the grandeur and solemnity of the Russian Church, and when they went away they were loaded with presents for the Negus and many holy images and other symbols of the Orthodox faith.

AFGHANISTAN, a monarchy in central Asia. The Ameer or ruler is Abdurrahman Khan, a grandson of Dost Mohammed, who was placed on the throne in July, 1880, when British troops occupied the capital.

The population is about 4,000,000, consisting of tribes of Pathan, Iranian, Uzbek, and Mongol as well as of Afghan extraction, Sunnite Mohammedans except 2 Shiite tribes, some peaceful in disposition and engaged in agriculture, handicrafts, and trading, others pastoral, warlike, and frequently rebellious. The present Ameer has established a firmer central government than his predecessors, aided by money and arms granted by the Government of British India. His subsidy from the Indian exchequer was increased in 1893 from 1,200,000 to 1,500,000 rupees a year. He maintains a regular army in addition to the feudal militia, and is said to have 20,000 men under arms. There are nearly 8,000 infantry and an artillery force of 76 guns. Powder is manufactured at Cabul, the capital, under the superintendence of Europeans.

The exports to India by the Sind-Pishin Railroad are fresh and preserved fruits, asafetida, and nuts, and the imports consist of cotton goods, indigo, and sugar. Chinese tea is forwarded by this route to Russian Central Asia, with which there is a growing trade in Afghan wool and other products. Russian cotton goods constitute 40 per cent. of the total imports, and Indian cottons 20 per cent. The imports from India were valued at 4,052,000 rupees in 1894. They were twice as great in 1890.

The British Alliance.—The policy of the British Government is to preserve a strong, united, and independent Afghanistan as a buffer state between India and the Russian dominions in Asia. Great Britain is bound by her treaty with the present Ameer to aid him with troops in case of an unprovoked encroachment upon his frontiers. Abdurrahman has been aided and encouraged in his efforts to create a modern army, and was prompted to defend Penjdeh and to seize the native states of Rohan and Shignan in order to prevent the Pamirs from falling into the hands of Russia. British strategists no longer expect, however, to defend the northern frontiers of Afghanistan against a Russian advance upon India, but only to foster the military spirit and prowess of the Afghans, and preserve their friendship, so that they will make a stand in defense of their own country instead of allowing a free passage, or perhaps joining the invaders, as they have done in former invasions of India. The latter contingency has not been overlooked in the calculations of the British, who rely mainly on the new scientific military frontier of northwestern India, which has been fortified at enormous expense, and to obtain which not only have independent Hima-

layan states been conquered and Beloochistan annexed, but parts of Afghanistan itself have been overrun and forcibly occupied at the risk of forfeiting the friendship of the Afghans.

Abdurrahman has established in Cabul workshops in which everything requisite for an army is manufactured on a large scale under the superintendence of an English engineer, Sir Salter Pyne. In the gun factory Hoteckies, Gardner, and Maxim machine guns, rifled cannon, and Martini and Snider breechloading rifles are turned out by means of steam machinery brought from England. Cartridges are made at the rate of 13,000 a day. Of field guns 48 are made per annum. Gunpowder is manufactured from saltpeter found in the soil, and charcoal obtained from willows planted in abundance for the purpose. Swords, sabers, and knives of fine temper are forged in quantities. In other shops are manufactured saddlery, boots, band instruments, military clothing, etc. There is a foundry in which 6 tons of metal can be cast in one piece. The rolling mills, steam hammers, boring machines, and lathes are capable of all kinds of work.

There are also large soap and candle factories. The mint has a maximum capacity of 180,000 silver rupees *per diem*. The Ameer has had a light railway laid down to bring limestone from the hills, 7 miles from Cabul, for the walls of his new palace and citadel. To improve the breed of army horses the Ameer maintains a stud of 17,000 or 18,000 animals in which the best blood of Asia and Europe is cross-bred under the direction of an English veterinarian.

Abdurrahman Khan, who was so ill in 1894 that his life was despaired of, subsequently recovered sufficiently to take up again the reins of government. He contemplated making his long-promised visit to England, but finally sent his second son, Nasrullah Khan, in his stead. When Abdurrahman dies, there may be a contest for the succession, as has often happened in this country. His chosen successor is Habibullah Khan, the eldest son, who is already his father's deputy for the administration of justice in the capital. There is already a party in favor of a younger son of the Ameer related through his mother to the Barakzai clan, the former rulers of the country, who were supplanted by the Sadozai dynasty. Ishak Khan, the pretender, who has already attempted to overthrow Abdurrahman, is now a fugitive in Turkestan, and a pensioner of the Russian treasury.

Nasrullah Khan arrived in England on May 23, 1895, with a retinue of 120 persons. He was received in state and entertained with official ceremony for several months.

The Pamir Agreement.—The southern limit of the Russian sphere of interest in the Pamir region was declared in the original agreement between Great Britain and Russia to be the Oxus river up to its source. The Russians have held that the Panja or southern branch of the Oxus is the true upper course of the river, being the larger and longer. The British claimed at first that the Murghab was meant, but discovered that this contention was untenable. The Chinese, instigated, as the Russians supposed, by English agents, occupied the eastern part of the Pamirs, beyond the lakes of

Yashikul and Sirikul, and the Afghans, prompted, no doubt, by the English, invaded and conquered the states of Shignan and Roshan, occupying the rest of the Pamirs. The Afghans, in their usual way, robbed and oppressed the inhabitants of the country that they sought to subjugate. The Russian authorities were immediately aware of the acts of the Chinese and Afghans, and took prompt measures to avoid being embarrassed in their legal position, by a *fait accompli*. The Chinese intruders were first expelled and the fortifications that they had erected were occupied by Russian troops. Col. Yonoff entered the country occupied by the Afghans with a detachment of Russian troops in the summer of 1894, and drove the invaders across the Panja. The British ambassador at St. Petersburg protested, and a truce was arranged. Col. Yonoff's Comrads were withdrawn to the northern side of the Murghab, and the Afghans promised to interfere no more in Shignan and Roshan pending a settlement of the disputed points in the Anglo-Russian boundary treaty. The Afghans, after the retirement of the Russian force, re-entered the disputed territory and harassed the Tajik natives. Still the Russians remained on the Murghab while negotiations proceeded in London. The British diplomats did not persist in contending that Shignan and Roshan belonged to Afghanistan. An agreement was reached by the Earl of Kimberley and M. de Staal on March 11, 1895. The Pamirs, with the exception of the Little Pamir, were conceded to Russia, inclusive of Shignan and Roshan and all the country lying north of the Panja up to Lake Victoria or Sirikul. From that lake eastward the two spheres of influence are divided by a line which, starting from a point on that lake near its eastern extremity, follows the crests of the mountain range running somewhat to the south of the latitude of the lake as far as the Bender-sky and Orta Bel passes. Thence the line runs along the same range, while it remains to the south of the latitude of the lake. On reaching that latitude it shall descend a spur of the range toward Kizil Rabat, on the Aksu river, if that locality is found not to be north of the latitude of Lake Victoria, and thence it shall be prolonged in an easterly direction so as to meet the Chinese frontier. If it is found that Kizil Rabat is situated north of the latitude of Lake Victoria, the line of demarcation shall be drawn to the nearest convenient point on the Aksu river south of that latitude, and thence prolonged as aforesaid.

It was arranged that a joint commission, composed of British and Russian delegates, with technical assistants and a military escort no larger than would be necessary for protection, should demarcate the boundary as thus defined. The British Government was permitted to arrange for the representation on the Commission of the Ameer of Afghanistan. The commissioners were charged with the duty of reporting any facts that could be ascertained on the spot regarding the situation of the Chinese frontier, with a view to enable the two governments to come to an agreement with the Chinese Government as to the limits of Chinese territory in the vicinity of the line. The British and the Russian governments engaged to abstain from ex-

ercising any political influence or control, the one to the north and the other to the south of the line of demarcation. The British Government engaged that the territory lying within the British sphere of influence between the Hindu Kush and the line running from the east end of Lake Victoria to the Chinese frontier shall form part of the territory of the Ameer of Afghanistan, and it shall not be annexed to Great Britain, and that no military posts or forts shall be established in it.

The execution of this agreement was made contingent upon the evacuation by the Ameer of Afghanistan of all the territories occupied by his troops on the right bank of the Panja, and on the evacuation by the Ameer of Bokhara of the portion of Darwaz which lies south of the Oxus, in regard to which the British Government and the Government of Russia agreed to use their influence respectively with the two Ameers.

The British commission was constituted with Col. Gerard as chief commissioner, and Col. Holdich and Major Wahab as survey officers. The Russian commission was composed of Gen. Schweikoffsky as chief officer, with M. Panafidin and Col. Galkin as assistants. The commissioners proceeded to the ground in July.

Chitral.—The extending of British political power over the border tribes between the Indus valley and the Hindu Kush began before the Russians became active in the Pamirs. Costly little wars have been carried on under the name of punitive expeditions against the tribes that have hitherto owed allegiance to Cabul, and political agents have been placed in the independent states bordering upon Afghanistan and the Pamirs from Khelat to Cashmere. Chitral, a state that has been politically dependent upon Afghanistan, occupies a valley into which lead three passes of the Hindu Kush. This is a Mohammedan state that was consolidated by the Mehtar Aman-ul-Mulk. The people are Afghans, speaking the Afghan language. A British mission was sent to that ruler in 1885 under Col. Lockhart. When the old Mehtar died, in 1892, Afzul-ul-Mulk seized the throne, murdered a number of his half brothers, marched against Nizam-ul-Mulk, his own brother and the legitimate heir, who was Governor of Yasin, and drove him to take refuge under British protection at Gilgit. The Government of India recognized this usurping Mehtar, but he was killed in defending the throne against a rival, his uncle Sher Afzul, who raised a force in the neighboring Afghan province of Badakshan, where he lived in exile, killed the governor of the province, and captured the citadel of Chitral by surprise. The new usurper won the affections of the Chitralis by dispensing munificently the hoarded treasure of old Aman-ul-Mulk; but he was not acceptable to the British, having attained power with the help of the Afghan Ameer, to whom he looked for further support. They therefore set free their prisoner, Nizam-ul-Mulk, and enabled him to enter Chitral with a force recruited in Gilgit, supporting him with British troops, which moved upon Yasin and permanently occupied that province. Sher Afzul, after a single brush with the invaders, fled back to Afghanistan and was interned at Cabul.

Having established Nizam-ul-Mulk upon the throne, the British stationed a political agent in Chitral, Mr. Robinson, who arrived in January, 1893. He remained in the capital till the September following, and then removed his headquarters to Mastuj, nearer Gilgit. Nizam never was popular, and after he came back as the puppet of the English and the betrayer of the ancient independence of the country he led a lonely life, having no pleasure but hunting and hawking. On Jan. 1, 1895, he was murdered at the instance of his half brother Amir-ul-Mulk, a young man of nineteen, who proclaimed himself Mehtar and asked Lieut. Gurden, who happened to be in Chitral with a guard of only 8 soldiers, to recognize him as the ruler. While the British political agent temporized, and before the new pretender had won many adherents or obtained popular recognition, Umra Khan, chief of the neighboring state of Jandol, who had murdered his brother and seized the throne in 1879, and since then pursued a career of conquest, aided and encouraged by the British authorities, who furnished him with modern arms and military instructors, invaded Chitral, a slice of which he had annexed to his dominions some years before. Probably his aid was solicited by Amir-ul-Mulk, who had married his daughter. But he, having no confidence in this incompetent young man, summoned Sher Afzul in Cabul to join him in expelling the British, promising to establish the exile as Mehtar. The army of Umra Khan fought a successful battle with the Chitralis on Jan. 25, and laid siege to the fortress of Drosh. Meanwhile the Sikh guard of 50 men had come down from Mastuj to protect the British resident, and on Jan. 30 Dr. G. S. Robertson, the political agent at Gilgit, who had been ordered to go to Chitral to inquire and report in regard to the succession to the throne, arrived with 150 Gurkha troops and 33 Sikhs. This escort was strengthened a few weeks later by another hundred, making 341 men, provided with 200 rounds of ammunition and rations for three months. Kala Drosh, defended by 300 Chitralis, two thirds of whom had Snider rifles, was captured by the Pathan army of 3,000 men, of whom 500 had Snider and Martini rifles, in the middle of February. About the same time Sher Afzul, whom the Ameer of Cabul had permitted to escape at this critical juncture, appeared in the camp of Umra Khan, who received him with open arms and put him forward as a candidate for the throne as the champion of national independence. Sher Afzul was jubilantly greeted as their sovereign and hero by the Chitralis, especially in Lower Chitral, who passionately demanded deliverance from British subjugation. The British shut themselves up in the fortress at Chitral, which was closely invested. The Indian Government ordered 1,000 troops to Chitral from Gilgit, one third of the garrison that was kept there to defend the whole frontier, and prepared to send a division of 14,000 men from Peshawur, which was only 186 miles from Chitral, nearer than Gilgit, but the route went over a snowy pass, 10,000 feet high, the one Umra Khan's army had traversed. While arrangements were being made for this difficult march, warning was sent

to Umra Khan to evacuate Chitral before April 1, else he would be forcibly expelled, for the country was under the suzerainty of Cashmere, as he had been already informed on the occasion of his previous aggression upon Chitral territory. At the same time the Indian Government issued a proclamation to the tribes living along the line of march, saying that they would not be molested if they remained quiet, and stating that the object of the expedition was to put an end to the present and to prevent any future unlawful aggression upon Chitral territory.

Sher Afzul established himself in the town of Chitral and was received as Mehtar by the people of the country, while Amir-ul-Mulk took refuge with the British in the fortress. Capt. Baird led out a reconnoitering party on March 2, when Sher Afzul first arrived, and, not knowing that the whole place was in the possession of the enemy, he was taken in the rear and fought his way back with heavy loss. He received a wound from which he died, and a general and a major of the imperial service troops were killed, with 21 noncommissioned officers and sepoy, while Capt. Campbell and 28 men were wounded. The fort was closely invested on the following day. On March 8 the enemy attempted to fire the water tower, but were driven off. On March 14 they assailed the eastern side of the fort, and were again repelled. On April 5 they occupied a summerhouse in the garden of the fort, within 50 yards of the gun tower, and on the 7th they attacked the tower and set it on fire, and at the same time attempted to destroy the water way by which the garrison was supplied with water from the river. The defenders finally beat them off, but not without suffering heavy losses in killed and wounded. The besiegers were armed with excellent rifles, and displayed wonderful marksmanship. They renewed their attempt to fire the gun tower on the 8th, and on the 11th carried out a general attack on all sides of the fort, in repelling which Mr. Robertson was badly wounded. The besiegers advanced then with regular siege works, bringing their mines up to within 30 feet of the walls. On April 17 the officers in the fort decided on a sortie. Lieut. Harley led a bayonet charge, captured the summerhouse after a desperate fight at close quarters, and blew up the enemy's mine. The garrison lost 8 men killed and 13 wounded, while of the enemy 60 were killed, more than half of them with the bayonet. In the meanwhile relief was approaching from both the north and the south, and on April 18 Sher Afzul raised the siege and withdrew with his forces to Kala Drosh.

The garrison at Mastuj, 300 strong, endeavored to keep up communications with Chitral. While on their way to that place Lieut. Fowler and Lieut. Edwards were besieged at Reshun, 30 miles north of Chitral. After resisting for seven days the intermittent attacks of the tribesmen, the British officers and 9 sepoy were captured and taken as prisoners to Sher Afzul at Chitral, and afterward to Umra Khan's headquarters at Barwa. They were treated well by the chief, who finally released them to save their lives from his own fanatical followers.

A detachment of 74 Sikhs under Capt. Ross

THE CHITRAL EXPEDITION ENTERING BAJAUR, VALLEY OF THE PANJKORA.

hastened on from Mastuj to succor Lieut. Fowler and Lieut. Edwards in Roshun. The Chitralis attacked and almost annihilated this force on Feb. 9 in a defile near Karagh, killing Capt. Ross and 54 men. The enemy, outnumbering the Indian troops tenfold, caught them in a difficult position where their rifles were ineffective against stones that were hurled by the tribesmen down the hillsides, knocking down men in the ranks. Lieut. Jones, who was wounded, retreated to Boni with only 14 men left, and remained there until he was relieved a week later by a detachment from Mastuj.

Lieut.-Col. J. G. Kelly, commanding a regiment of pioneers in Gilgit, was ordered to march toward Chitral to relieve the pressure on the garrisons in Mastuj and Chitral, and avert, if possible, a general uprising against British authority in both Chitral and Yasin and the destruction of the 4 military posts held by fewer than 700 men. Col. Kelly set out from Gilgit on March 23 with 400 pioneers and 2 mountain guns. At Ghizr the force was augmented by 40 Cashmere sappers and miners and 100 Hunza-Nagar levies, making in all about 600 fighting men, afterward increased by 50 levies under Rajah Aklar, Khan of Punyal.

Capt. Borrodale succeeded in making a road over the Shandur pass, 12,200 feet high, which was covered so deep with snow as to be impracticable for beasts of burden. For 7 miles the guns were carried on the shoulders of men. As the expedition descended into the valley of Chitral the enemy were found posted at Chakawat and other places. Their positions were turned by the Hunza levies, who flanked them from the

craggs above and cleared the *sangars*, or stone breastworks, with the aid of the artillery, driving the Chitralis in precipitate flight down the valley. In this action, which opened the way to Mastuj, Col. Kelly lost only 5 men wounded, and inflicted on the enemy a loss of 25 killed and 50 wounded. The first division reached Mastuj on the same day, April 9, and halted there three days for the rest of the force to come up. A second engagement took place when the march was resumed. Mohammed Isa held a strong position at Nisa Gol with 1,500 men against 622 who advanced to the attack; but with their guns the British cleared the road and henceforth they encountered no opposition, and on April 20 reached Chitral.

A part of the re-enforcements were sent by the Maharajah of Cashmere, the suzerain of Chitral, belonging to the imperial service troops which he held at the disposal of his suzerain. The Ameer of Afghanistan, who was ready to re-establish his rule over Chitral and the states that Umra Khan had conquered, sent a division of his army to the frontier to watch, with orders not to interpose unless the Indian Government decided to withdraw from the country and permit the Afghans to come in. This the Indian statesmen would not consent to, fearing that the Chitralis at least would find Afghan rule as irksome as it proved to their neighbors of Wakhan, Shignan, and Roshan.

Gen. Sir Robert Cunliffe Low started with his expeditionary force on April 1, no satisfactory answer having been received from Umra Khan. A metalled road was constructed, and the rough stairs that served as a path over the Malakand

pass were converted into a road for camels and artillery. The Swatis and Yusufzais, numbering 30,000 fighting men, prepared to resist the British columns in accord with Umra Khan, who attempted to proclaim a *jehad* or religious war, but was not supported in this by the Mollah of Manki. The Malakand pass was the only strong position. Reaching this point after three days' march, Sir Robert Low sent one of his three brigades to the Shahkot Pass for a diversion, while with another under Col. Waterfield he ascended the Malakand. The British worked their way slowly onward, shelling with mountain guns the Swatis out of the stone breastworks behind which they were posted, and sweeping the road and the heights with machine guns. The other brigade came up with artillery at a critical bend in the road where the Swatis had placed their strongest defenses, and where they terrified the troops by rolling pieces of rock down upon them. The Gordon Highlanders, the Scottish Borderers, and a regiment of Dogras here charged up the hill and dislodged with their bayonets the Swatis, who fought stubbornly until they were taken in the flank by the Guide Corps, when they fled, leaving the pass in the hands of the British. The latter lost 11 killed and 33 wounded, including 8 officers. The brigade constituting the advanced guard encountered 5,000 Swatis, who blocked the road to the Swat river and fought another sharp battle, which was ended by a dashing cavalry charge of the Guides. Over the river a trestle bridge, succeeded later by a permanent suspension bridge, was built under a heavy fire, and after crossing the river a Bengal regiment charged and routed the enemy, and Chakrana was occupied, while the Scottish Borderers, fording the river farther up, took Thana fort, where a brother of Umra Khan was in command. The Swatis and Bajauri tribesmen, after being defeated, made their submission and settled down at once, and Umra Khan's followers dwindled as the British advanced. On April 13 the Guides were attacked by the enemy, and Col. Battye, the commanding officer, was killed. The force retreated, but resumed the advance almost immediately. The second brigade attacked Dir, capturing the fort by storm, with the garrison and its commander, Umra Khan's brother Mohammed. Gen. Low gained the friendship of the Khan of Dir in order to get his assistance in relieving the beleaguered garrison at Chitral.

Umra Khan's force, reduced to 600 men, offered slight resistance to Sir Robert Low's column, which advanced to Miankalai, the principal town of Bajaur, skirmished with the enemy for two days, and on April 18 prepared to attack Munda, the chief fort; but they found it deserted, Umra Khan evacuating the country with all his men. He threw himself upon the protection of the Ameer at Cabul, who upbraided him for his wrongdoing, but accorded him the hospitality that he claimed as a Mohammedan. He gave him two villages, but on complaints from the British placed him under guard.

Col. Kelly had by this time reached Mastuj and relieved the garrison, which had been closely invested for eighteen days. He pushed on, defeating the enemy at Nisagal on April 13, and approached Chitral simultaneously with some

tribesmen from Dir whom Gen. Low had taken into his service and sent ahead in all haste to raise the siege. Sher Afzul's forces, thus caught as in a vise, melted away. Sher Afzul, with his principal lieutenants and about 1,500 men, was surrendered to the Khan of Dir. The relieving force from the north arrived before Gen. Gatacre with the advanced guard of Gen. Low's force had crossed the Lowara pass. The casualties sustained during the investment were 39 killed and 62 wounded. The total cost of the campaign exceeded £1,000,000.

The British, being now established as masters of Chitral, deposed the Mehtar Amir-ul-Mulk and carried him off to India as a prisoner of state. In his place they set up his brother Shuja-ul-Mulk, who was only nine years old, but was the last remaining legitimate son of Aman-ul-Mulk. Sher Afzul was captured with his brothers and thrown into prison.

The future of Chitral was made the subject of a long controversy by the Indian statesmen and strategists. The Indian Government officials and the army officers in India generally favored its retention, although this would require the building of a road over the mountains and entail an addition of 3,000 men to the peace strength of the Indian army and a permanent increase of £250,000 in the annual budget. The reason that a British garrison was originally placed in Chitral was that, after Col. Yennoff had made a reconnoissance in the northern part of the country in 1891, Russian journalists boasted that in the event of a war between Great Britain and Russia a small force could cross the Hindu Kush at this point and start a rebellion against the British rule in Cashmere and the neighboring countries. Some of the British military men were now convinced that Chitral was of no strategical value, but that, having once established themselves there, the British could not now retire without weakening their prestige along the whole frontier. The Chitrali tribesmen continued to attack the British posts that were established in the country, and the Liberal Government decided to withdraw as soon as the operation could be carried out consistently with dignity and safety. To hold Chitral without a permanent road from Peshawar was out of the question, and such a road could not be built and kept open without breaking faith with the tribes, to whom Gen. Low had given the assurance that no occupation of their country was intended, nor without subjugating those tribes, the Swatis, Yusufzais, Bajauris, Mohmands, and Bunerwals, numbering over 60,000 fighting men. The Liberal Government in England having resigned without taking any definite steps to carry out their decision, their successors determined to give more study to the problem, meanwhile continuing the military occupation of Chitral. They decided to retain the country, promising the Indian Government that the army would not be increased and that only one native regiment would be added to the garrison previously posted in Gilgit and Chitral, native levies being depended upon to guard the road between Kila Drosh and the Swat river, for which a shorter and easier route was found than that followed by Gen. Low's expedition. As soon as was practicable the British troops would aban-

dan the country west of the Panjkora river, comprising the former dominions of Umra Khan, the northern part being added to the territory of the Khan of Dir and Bajaur restored to tribal government.

Waziristan.—The survey and establishment of the agreed boundary between Afghanistan and Beloochistan necessitated the military occupation of Waziristan by a large force under Sir William Lockhart. Flying columns went through the country in January, 1895, and destroyed the villages of the Mahmds, whose men and chiefs had opposed the British occupation. The Waziris also fired upon them, and were punished by the destruction of their habitations and the confiscation of their cattle. The Waziris paid the fine that was imposed upon them and delivered up their arms. By the middle of February 350 miles of the border were demarcated, up to Chaman, half way to the Persian frontier. The Malika, representing the Afghan Government, concurred in the line as surveyed by British officers. After the northern section, from Charikaghar to Mount Laram, on the northern border of Waziristan, had been demarcated the commissioners returned to India in April.

ALABAMA, a Southern State, admitted to the Union Dec. 14, 1819; area, 52,250 square miles. The population, according to each decennial census since admission, was 127,901 in 1830; 309,537 in 1850; 500,756 in 1860; 771,623 in 1870; 964,201 in 1880; 996,992 in 1890; 1,262,505 in 1900; and 1,513,017 in 1910. Capital, Montgomery.

Government.—The following were the State officers during the year: Governor, William C. Oates; Secretary of State, James K. Jackson; Treasurer, J. Craig Smith; Auditor, John Purifoy; Attorney General, William C. Fitts; Commissioner of Agriculture, H. D. Lane; Superintendent of Public Instruction, John O. Turner; Adjutant General, Charles P. Jones; Chief Justice of the Supreme Court, Robert C. Brickall; Associate Justices, Thomas N. McClellan, Thomas W. Coleman, James B. Head, and Jonathan Haralson; Clerk, Sterling A. Wood—all Democrats.

Finances.—The total bonded debt of the State on Oct. 1, 1894, was \$9,299,400, of which \$8,345,400 are payable on July 1, 1906, and \$954,000 on Jan. 1, 1920. Under act of the Legislature these outstanding bonds may be increased by \$200,000 to exchange for old bonds, as follows: Class A, bonds bearing 4 per cent. interest till July, 1906, and 5 per cent. thereafter, \$195,000; Class B, bonds bearing 5 per cent. interest, \$18,000; and Class C, bonds bearing 4 per cent. interest, \$50,520. All bonds due in 1906 were issued in 1876; those due in 1920 were issued to retire the 6-per-cent. bonds of 1880. The annual interest charges on the bonds now outstanding aggregate \$477,756. In January, 1895, Gov. Oates reported that in addition to the regular bonded debt of the State there were liabilities amounting to \$3,214,356, comprising bonds in favor of the Agricultural and Mechanical College past due, \$253,500; indebtedness of the State to the State University for which the latter has never received any evidence, \$300,000; indebtedness of the State to the public schools on account of the "sixteenth section trust fund," \$1,991,770; and principal of money deposited

with the State by the United States Government in 1836, subject to be called for at any time, on which the State pays 4 per cent. interest, which goes to the support of the public schools, \$669,086. The Governor urged the Legislature to enact a sinking-fund law, by which the State debt might be gradually extinguished, and to amend the refunding act so that the bonds may be subject to call for redemption after ten or twenty years. He indicated measures which, in his judgment, would reduce the aggregate interest charged by \$140,000 per annum.

Valuations.—The total assessed valuation of taxable property in the State in 1894 was \$243,171,677, the tax rate was 5 mills, and the amount of taxes \$1,217,281. The assessed valuations in 1893 amounted to \$260,172,590, and the taxes to \$1,302,473, also on a 5-mill rate. In 1891 taxable property reached its highest valuation in the history of the State (\$275,316,491), and in 1893 the tax receipts were the largest.

Banking.—According to the last published report of the United States Comptroller of the Currency, Alabama had, on Oct. 31, 1894, 27 national banks. The combined capital was \$3,694,000; amount of United States bonds held to secure circulation, \$1,108,500; excess of such bonds beyond requirement, \$378,750; amount of coin and coin certificates held, \$594,869; notes issued for circulation, \$7,035,860; redeemed, \$5,839,647; outstanding, \$1,196,213; and loans and discounts, \$6,388,466. The State banks numbered 11, and had a combined capital of \$592,400, resources of \$1,213,108, deposits of \$340,889, and surplus and undivided profits of \$122,697. There were 4 savings banks, with combined capital of \$380,000, resources of \$855,420, deposits of \$368,051, and surplus and profits of \$64,513. Six private banks had a total capital of \$437,500, resources of \$1,042,515, deposits of \$450,242, and surplus and profits of \$118,222.

Education.—The State appropriation for public schools is about \$500,000 per annum, exclusive of the poll tax, which if fully collected would make the amount about \$750,000. The Governor, in a special message in January, called attention to the State's indebtedness to the school funds, reviewed the condition of the various institutions, and urged the imposition of a specific rate of taxation for schools, to be separate from other State taxes, believing that such taxation would be met more willingly by the people when they could see just how much they were paying directly for educational purposes and how much from the general fund as interest on the school trust funds. The following are the appropriations for the principal institutions: Agricultural and Mechanical College at Auburn, \$20,280; normal college for whites at Florence, \$7,500; normal college for whites at Troy, \$3,000; normal college for whites at Jacksonville, \$2,500; normal college for white girls at Livingston, \$2,500; normal college for the colored at Montgomery, \$7,500; normal college for the colored at Huntsville, \$4,000; and the normal college for the colored at Tuskegee, \$3,000. Besides the State appropriations, the Agricultural and Mechanical College receives annually from the congressional land grant under the

Morrill bill about \$11,000; the agricultural experiment station connected with the college receives annually under the Hatch bill about \$15,000; and the normal schools receive annually from the Peabody fund an aggregate of \$3,500; one of them from the Slater fund, \$2,500; one from the Morrill fund, \$8,000; and all, from cities, towns, and tuition fees, a total of about \$70,000.

Railroads.—On Dec. 31, 1893, the total single-track mileage was 3,627.89; during 1894 five lines added a total of 14.5 to their mileage; and on Dec. 31, 1894, the aggregate mileage was 3,642.39. The railroads represented a total capital investment of over \$117,750,000; had a funded debt of nearly \$60,000,000, and an investment in roadbed and equipment of over \$106,000,000; paid for interest on bonds over \$1,500,000; and had net earnings of nearly \$1,500,000.

The Iron Industry.—According to the report of the United States Geological Survey on "Mineral Resources" for the year 1894, issued in 1895, Alabama ranked third among the States in the production of iron ores. The total output was 1,493,086 long tons, or 12.57 per cent. of the whole production of the United States, valued at \$1,240,895. Of this total, 1,182,362 tons, or 79.19 per cent., was red hematite, and 310,724 tons, or 20.81 per cent., brown hematite. Although the State has an abundance of iron ores close to the coal basins, it has so far made no Bessemer pig iron, the ores exploited being too high in phosphorus. The average value of the iron ore in 1894 was 83 cents a ton, somewhat less than in the preceding year, but greater attention was being paid to the grading of ore used in furnaces. Manganese ores are found in the Murphrees valley, from 50 to 150 feet above the black shale of the lower siliceous group, with some traces in the La Grange sandstone. Dr. E. A. Smith, the State geologist, believes that the great bulk of these ores will be found in the Sand valley and on the northwest side of Red mountain; that the discoveries so far made are in the main accidental; and that probably the larger portion of the deposits that exist are as yet undiscovered. In October, 1895, the Tennessee Coal, Iron, and Railroad Company received a telegram from the Carnegie Steel Company, of Pittsburgh, Pa., saying that 5,000 tons of low silicon iron, made of Alabama red ore, and shipped to Pittsburgh, had been thoroughly tested and found to be in every respect suitable for direct conversion into steel. An additional shipment of 20,000 tons of the same grade was ordered. The results of this experiment remove all doubt as to the ability to make steel from low silicon Alabama iron, which is the product of ordinary red ore—a fact heretofore disputed. The production of iron ore in 1895 was expected to exceed the output of the preceding year, as the mines were being taxed to their utmost to supply the demand, the furnaces and mills were running on full time, and the railroads found it difficult to supply cars for the products.

Coal.—State Mine Inspector Hillhouse reported in October, 1895, that, from figures at hand and close estimates on the production for November and December, the output of coal for the year would be 6,000,000 tons, or 750,000 tons

in excess of that of 1893, which was the largest production in the history of the State to that time, and almost 2,000,000 tons more than were mined in 1894. All the old mines and many new ones were being worked to the utmost.

Cotton and Woolen Mills.—A census of the cotton and woolen manufacturing interests of the Southern States, in April, 1895, showed that Alabama had 26 mills, operating 164,898 spindles, 2,756 looms, and 517 cards. Twenty-one mills had a capital investment of \$3,678,000. The largest cotton-mill plant was in Huntsville, which was capitalized at \$650,000, and had 25,000 spindles and 750 looms. Other plants were capitalized at \$500,000, \$300,000, and \$250,000 each, and 7 at from \$200,000 to \$100,000 each. Besides the mills then in operation, 11 others were being constructed, one at Gadsden to employ a capital of \$600,000 and operate 25,000 spindles, and a similar one near Rome, both belonging to Massachusetts corporations.

Taxable Manufactures.—In the fiscal year ending June 30, 1894, the collections of internal revenue aggregated \$112,582.45 from the following sources: Distilled spirits, \$51,490.85; tobacco, \$15,458.31; fermented liquors, \$38,451.49; oleomargarine, \$5,609.60; and penalties, \$1,572.20. The same sources yielded a total of \$88,719.83 in the fiscal year ending June 30, 1893. The number of tobacco factories in 1894 was 47, which had a total output of 3,243,683 cigars; and of grain, molasses, and fruit distilleries, 103, of which 100 were in operation, producing 17,850 gallons of distilled spirits and 36,465 barrels of fermented liquors.

Agriculture.—The United States Department of Agriculture reported as follows on the principal crops of 1894: Corn, 2,537,249 acres, 34,760,311 bushels, value \$18,422,963; wheat, 50,274 acres, 417,274 bushels, value \$325,474; oats, 371,996 acres, 4,910,347 bushels, value \$2,504,377; rye, 2,145 acres, 28,529 bushels, value \$27,103; potatoes, 3,913 acres, 254,259 bushels, value \$223,748; and hay, 72,803 acres, 195,112 tons, value \$1,855,515; total value, \$33,559,082. The same authority reported the cotton crop of the year as 825,746 bales, and the New Orleans Cotton Exchange reported it for 1895 as 1,000,000 bales.

Live Stock.—In January, 1895, the United States Department of Agriculture estimated the number and value of farm animals in the State as follows: Horses, 123,400, value \$5,769,600; mules, 125,930, value \$7,265,473; milch cows, 317,978, value \$3,434,162; oxen and other cattle, 545,134, value \$3,738,913; sheep, 326,640, value \$474,804; and swine, 1,680,816, value \$5,385,236; total value, \$26,068,057.

Political.—At a conference in Birmingham, Nov. 13, it was decided that the Populists should co-operate with Republicans and other anti-Democrats in the next State campaign.

ALASKA. The Territory known as Alaska was ceded by Russia to the United States in a treaty concluded March 30 and proclaimed June 30, 1867, in consideration of the payment of \$7,200,000.

Boundaries.—The main body of the Territory is bounded on the east by the one hundred and forty-first meridian, on the north by the Arctic Ocean, on the west by Bering Sea and

strait, and on the south by the Pacific Ocean. Southeast of the main body there is a strip of land, known as Southeast Alaska, 10 marine leagues (34 statute miles) broad and about 600 miles long, besides numerous islands. The position of the boundary of this southeastern extension is now a matter of dispute between Great Britain and the United States. The boundary agreed on in the purchase of Alaska is defined in a treaty between Russia and Great Britain, made in 1825, as follows:

Commencing from the southernmost point of the island called Prince of Wales island, which point lies in the parallel of 54° 49' north latitude, and between the one hundred and thirty-first and one hundred and thirty-third degree of west longitude (meridian of Greenwich), the said line shall ascend to the north along the channel called Portland channel as far as the point of the continent, where it strikes the fifty-sixth degree of north latitude; from this last mentioned point the line of demarcation shall follow the summit of the mountains situated parallel to the coast as far as the point of intersection of the one hundred and forty-first degree of west longitude (of the same meridian); and, finally, from the said point of intersection the said meridian line of the one hundred and forty-first degree, in its prolongation as far as the frozen ocean, shall form the limit between the Russian and British possessions on the continent of America to the northwest. With reference to the line of demarcation laid down in the preceding article it is understood—1, that the island called Prince of Wales island shall belong wholly to Russia; 2, that wherever the summit of the mountains which extend in a direction parallel to the coast from the fifty-sixth degree of north latitude to the point of intersection of the one hundred and forty-first degree of west longitude shall prove to be at the distance of more than 10 marine leagues from the coast, the limit between the British possessions and the line of coast which is to belong to Russia, as above mentioned, shall be formed by a line parallel to the windings of the coast, and which shall never exceed the distance of 10 marine leagues therefrom.

Area.—The area of Alaska, as nearly as can be estimated, is 578,000 square miles, over eleven times as large as the State of New York. The general coast line is 4,000 miles long, and, including the shores of bays, islands, etc., is estimated to measure between 10,000 and 12,000 miles.

Drainage.—Alaska is drained principally by the Yukon river, which rises in the northwestern part of Canada, flows westward into Bering Sea, and divides the Territory into two nearly equal portions. The Yukon ranks among the great rivers of the world. It is about 2,000 miles long, and drains a forest-covered country 440,000 square miles in extent, half of which lies in Alaska. It has been ascended by small steamers as far as Selkirk House, 1,500 miles from its mouth. Many of its tributaries are navigable. The streams are usually open for navigation and free of ice by July 1, but are closed again about Oct. 1. The Kowak and Noatak rivers, which enter Bering Sea north of the delta of the Yukon, have been navigated by steam launches; and the Kuukukwim, flowing into Bering Sea south of the Yukon, drains an area of 800,000 square miles, and is said to be navigable. Of the several streams in southern and southeastern Alaska rising east of the mountains adjacent to the coast, the Stikine, the most southerly, has been ascended 200 miles.

Mountains.—The principal mountain systems of Alaska extend along the southern coast, and a partially submerged continuation of the same system forms the Aleutian Islands. The culminating points of this great mountain belt are Mount Logan, 19,500 feet high, in Canada (latitude 60° 34' 63", longitude 140° 24' 17"), and Mount St. Elias, 18,023 feet (latitude 60° 17' 35-1", longitude 140° 55' 47-3"), in the United States. Many neighboring peaks, several of which are more than 15,000 feet high, combine with the lofty summits just named to make the St. Elias region the most rugged and inaccessible on the continent. Mount Logan, named in honor of the first director of the Geological Survey of Canada, is, so far as now known, the highest peak in North America. Its nearest rival is Mount Orizaba, Mexico, which is between 18,200 and 18,300 feet high. A lofty peak west of Copper river, in about latitude 63° 30' and longitude 147°, is reported by the few frontiersmen who have seen it to rival Mount St. Elias in elevation.

Volcanoes.—The only active volcanoes in the United States are in Alaska. In the Alexander archipelago (where Sitka is situated), on the Alaskan peninsula and on the Aleutian Islands, there are many mountains of recent volcanic origin, about 10 of which have been in eruption since the purchase of the Territory. Several of these—as Shishaldin, on the island of Unimak; Makuskin, on Unalaska island; and Bogoslof, on a small island of the same name, about 60 miles west of Unalaska—are constantly emitting steam, and occasionally have a violent eruption. Recent examinations have shown that Mount St. Elias is not volcanic, but owes its origin to the upheaval of a block of the earth's crust bounded by fractures.

Glaciers.—The glaciers of Alaska are, with the exception of those of Greenland, the largest and most instructive in the northern hemisphere. The great glacier system to which they belong begins at the south in the High Sierra of California, in about latitude 37°, and extends northward along the Cordilleras, through western Canada and southern Alaska to the western extremity of the Alaskan peninsula, and embraces also some of the Aleutian Islands. This belt of snow fields and glaciers, 3,000 miles long, reaches its greatest development in the St. Elias region, where the mountains for 80 miles inland from the coast are literally buried beneath vast *névés*, or snow fields, from which streamlike glaciers of the same type as those of Switzerland flow both north and south. Those flowing south are much the larger, and in some instances have a length of over 50 miles. Many of the southward-flowing glaciers reach the sea, and, breaking off, send thousands of icebergs afloat. The best known of these tide-water glaciers end in Taku inlet and Glacier Bay, and are visited every summer by hundreds of tourists. Much larger glaciers of the same type occur at the head of Yakutat Bay, 250 miles west of Glacier Bay. Still farther west, about the base of Mount St. Elias, the alpine glaciers from the north unite on a plain adjacent to the sea, and form a plateau of ice, known as Malaspina glacier, that is 1,500 square miles in area, and not less than 1,500 feet thick. The outer or seaward

margin of this great Piedmont ice sheet is heavily covered with stones and earth, on which grow dense forests.

The snow line, or lowest limit of perennial snow, in the St. Elias region is about 2,500 feet above the sea. Below the snow line, in summer, every mountain spur and every island in the ice is covered with a luxuriant growth of brilliant alpine flowers.

In central and northern Alaska glaciers are absent; but beneath the forests in many localities, and under the luxuriant moss of the low, flat, swampy lands, known as *tundras*, that

forests are dense. The trees are frequently fine, and reach a height of 150 feet. Beneath the forests and extending above the timber line the ground is deeply covered with moss and luxuriant ferns. The majority of the trees are spruce, of which 2 species, the Menzies and the Mertens, are about equally abundant. Cedars are plentiful, the most valuable being the yellow cedar, celebrated for the beauty and durability of its fine yellow and fragrant wood. This is especially valuable for shipbuilding, but unfortunately the supply is limited. The timber laws in force in the older portions of the United

TOMB OF AN ALASKAN CHIEF.

fringe the coast of Bering Sea and the Arctic Ocean, the soil is always frozen. The depth of this subsoil ice is known in some instances to exceed 200 feet.

Forests.—In southeastern Alaska the upper limit of timber growth, or the "timber line," is at an elevation of 4,000 feet, but it decreases in elevation when followed westward along the coast. At the base of Mount St. Elias it is only 1,500 feet, and it reaches sea level on the Alaskan peninsula. Kodiak island, the Aleutian Islands, and a belt of country about 100 miles broad fringing the shores of Bering Sea and the Arctic Ocean (the tundra belt), are treeless. Throughout the southeastern portion of the Territory as far westward as Yakutat Bay the

States have not been extended to Alaska, and the forests are still practically untouched. A few sawmills have been established to meet the local demand for lumber, but exportation is prohibited.

In central Alaska, and especially in the region drained by the Yukon, the forests are dense, but of small growth. The trees are mostly white spruce, and of minor value for lumber. Cottonwood and small willows grow along the streams, but hard-wood trees are wanting.

Throughout the Territory berries of many kinds—including huckleberries, salmon berries, black currants, dwarf raspberries, and strawberries—grow luxuriantly, and are largely used by both the natives and white inhabitants.

Climate.—The climate of Alaska presents marked diversities. In the southeastern and southern part of the Territory the annual rainfall is heavy, sometimes exceeding 100 inches, and is distributed through every month of the year. The summers are cool and humid, the winters mild, with an increased rainfall and light snow at sea level. In the mountains the snowfall is excessive. On the shores of Bering Sea and the Aleutian Islands the summers are cold and humid, the winters prolonged, with rain and snow, but the temperature is not low, and not marked by great variations. In the interior, especially on the Yukon, the summers are short, dry, and hot; the winters long and extremely cold, but the snowfall is not heavy. The climate of the southeastern and southern shore, including the Aleutian Islands, although humid, is especially favorable to health.

Inhabitants.—The natives belong to two great stocks, the Eskimo and the Indian. The former inhabit some of the Aleutian Islands and the shores of Bering Sea and the Arctic Ocean; the latter occupy the interior and southeastern portion of the Territory. A few Russians still remain, although many emigrated at the time of the purchase of the Territory. Where the natives have come in contact with foreigners there are many half breeds. Since the beginning of American rule the white population has increased. The eleventh census (1890) gives the population as follows:

CLASS.	Total.	Males.	Females.
Natives	22,782	12,106	11,426
White	4,294	3,526	445
Mixed	1,814	891	929
Total	29,644	16,523	12,794

It is estimated that since 1890 the white population has been increased about 1,000 by immigrants, most of whom are miners that have settled at Juneau and other mining camps or gone to gold fields on the Yukon. The principal centers of the white population are: Juneau, 671; Sitka, 280; Wrangle, 71; Kadiak, 127; Unalaska, 66.

Government.—Alaska was without civil government from the time of its purchase to May 17, 1884, when it was made a "civil and judicial district" and the general laws of Oregon were extended to it. Although frequently designated as a Territory, it is not so legally. In the act referred to above it is expressly stated that "there shall be no legislative assembly in said district, nor shall any delegates be sent to Congress"; but in the same act it is referred to as the "Territory of Alaska."

The officers for Alaska, appointed by the President, are: Governor, salary \$3,000; marshal, \$2,500; judge, \$3,000; clerk, \$2,500; and four commissioners, who receive the customary fees.

The temporary seat of government is at Sitka, formerly the Russian capital.

The laws prohibit importation, manufacture, or sale of intoxicating liquors, except for medical, mechanical, and scientific purposes. But in spite of this stringent statute liquor is sold openly in Sitka, Juneau, Wrangle, and other places. Public sentiment is against the sale of

liquor to Indians, and several offenders in this direction have been prosecuted.

Education.—Schools for both white and native children have been established by the Russian Government, the United States Government, and various churches. In 1894 there were 14 day schools and 1 industrial home at (Metlakatla) supported by the General Government, and 20 schools deriving their support wholly or in part from other sources. Of the latter class, 5 are sustained by the Russian Government; 1 by the Holy Synod of Russia; 1 by the Board of Missions, Protestant Episcopal Church; 4 by the Presbyterian Board of Home Missions, assisted by appropriations from the General Government; 1 by the Sisters of St. Ann; 1 by the Catholic Church; 2 by the North American Commercial Company on the islands of St. Paul and St. George; 1 by the American Branch, Swedish Mission Friends; 1 by the Swedish Evangelical Union; and 2 by the Russian Church. In these schools 57 teachers were employed, and the attendance was about 1,800.

Fisheries.—Codfish, halibut, herring, and eulachen or candlefish (a very oily species of smelt) are plentiful in the ocean waters of the south coast, while several species of salmon and trout abound in the river at certain seasons. In 1890 the catch of codfish aggregated 506,000 fish, producing 760 tons of dried fish, valued at \$38,000. The principal station for this industry is on the Shunagin Islands.

The catching and canning of salmon has become a well-organized and profitable industry. Beginning in 1878 with a catch of 14,854 cases (of about 100 pounds each), it has increased rapidly. In 1891 800,000 cases were shipped, having an estimated value of over \$3,000,000. In addition 26,000 barrels of salted salmon were shipped, having an estimated value of \$200,000. In 1890 there were 36 salmon canneries in operation on Kadiak island and eastward, and more than 4,000 men, exclusive of native fishermen, were employed. Another branch of the fishing industry is the manufacture of oil and fertilizer. The Alaskan Oil and Guano Company, at Killisnoo, in 1894, produced 400,000 gallons of herring oil and 1,000 tons of "guano," besides 1,000 barrels of salted herring. They also make their own barrels from Alaskan timber, and pay annually about \$20,000 in wages.

Furs.—Alaska is still one of the leading fur-producing regions of the world. The character of the furs, their number, etc., from 1881 to 1890, is given thus:

CLASSIFICATION.	Number.	Value.
Sea otter	47,842	\$4,784,200
Fur seal	1,162,806	17,442,090
Land otter	27,730	138,650
Black fox	15,910	297,720
Coon fox	53,151	106,302
Red fox	62,718	62,718
Blue fox	21,814	106,570
Beaver	60,940	204,700
Martin	127,601	382,908

In addition the following fur-bearing animals are found in Alaska, and furnish large quantities of pelts, many of which are used in the Territory, but do not form an important article of export, viz., bear (polar, black, and brown), lynx,

SITKA, CAPITAL OF ALASKA.

wolf, muskrat, wolverine rabbits, marmots, and squirrels. Moose and caribou were formerly abundant, but are now becoming scarce. The total value of furs shipped from the time when the Territory came into the possession of the United States to 1890 was \$48,518,929, and the total, under both Russian and American rule, was \$93,271,190.

The Seal Islands.—The seals of Alaska form two groups—the hair seal and the fur seal. The former, of which there are several species, is found throughout the coast line, and is the more important of the two, as it furnishes the natives with large supplies of food, oil, and skins. Their covering is of hair, and, although this is beautiful, their pelts are not used in civilized countries for clothing. Their skins make excellent leather for bookbinding and similar purposes, but thus far have not been exported from Alaska.

The fur seals are now confined to the Pribylov Islands, in Bering Sea, where they resort for breeding. These islands consist of St. Paul and St. George, 33 and 27 square miles in area, respectively, and 2 outlying rocks known as Otter and Walrus islands, which are seldom visited by the fur seals. The seals return to St. Paul and St. George islands each year about May 1, their young are born soon afterward, and they leave again in October and November. During the winter they live at sea and journey as far south as the coast of California.

The best estimates of the seals that visited the seal islands annually between 1871 and 1889 place their number at 4,000,000. Within the past few years they have greatly diminished, owing largely to capture at sea by poachers. In 1891 57 vessels were engaged in this occupation, and by estimate 52,000 skins were taken. In the following year the catch at sea was much larger.

The seal islands are a Government reserve, and are leased with the privilege of taking a certain number of male seals over one year old annually. The lease of the islands was held by the Alaskan Commercial Company from 1870 to 1890, and since 1890 it has been in the hands of the North American Commercial Company. Each of these organizations has its office in San Francisco. Under the terms of the contract with the Alaskan Commercial Company the lessees were allowed to take 100,000 skins a year; under the current contract the number that may be taken annually has been reduced. The revenues derived by the United States from the leasing of the islands between 1870 and 1890 were between \$7,000,000 and \$8,000,000.

The marked decrease in the number of seals visiting seal islands, owing to their destruction while at sea, largely by Canadian sealers, led to a diplomatic controversy between the United States and Great Britain, which was finally settled by a tribunal of arbitration that sat in Paris in the summer of 1893. (See *BERING SEA TRIBUNAL OF ARBITRATION* in the "Annual Cyclopaedia" for 1893, page 79.)

Whaling.—The northern shores of Alaska are frequented by whales, and for several years have been the field of an important whaling industry. About 50 vessels are engaged in this occupation. The products of the catch in 1891 were 12,238 barrels of oil, 186,250 pounds of

whalebone, and 1,000 pounds of ivory; total, \$1,218,293. From 1874 to 1891 318,917 barrels of oil, 4,931,950 pounds of whalebone, and 272,410 pounds of ivory were obtained.

Mining.—The mining laws of the General Government have been extended to Alaska, and 8 mining districts established. The minerals that have been found in sufficient abundance to be of economic value are gold, silver, copper, and coal; and gold and silver are the only ones now mined. The largest and most profitable mine in operation is the Treadwell, on Douglas island, nearly opposite Juneau. The lode there worked is practically inexhaustible, but is of low grade, the yield being \$3 to \$4 to a ton of ore. In the year ending May 1, 1894, 240,000 tons of ore were crushed, yielding \$768,000, with a net profit of \$440,000. This is the largest quartz mill in America, and has 240 stamps.

Other mines, both of gold and silver, are being developed in the same regions. Mining on the Yukon river is now confined to washing gold from river gravels. In 1890 more than 1,000 miners were engaged in this occupation. Ledges of gold-bearing quartz have been discovered on the Yukon, but as yet no attempt has been made to work them.

The product of the mines of Alaska for the years 1880 to 1890, inclusive, as estimated by the Director of the United States Mint, was: Gold, \$4,604,500; silver, \$27,340.

Large deposits of coal exist at several widely separated localities in the Territory; but up to the present time coal mining has not been commercially successful. Copper is also known to exist, both as native copper and in various combinations, but has not been successfully mined.

Agriculture.—Nothing worthy of the name of agriculture has as yet been developed in Alaska. One of the chief reasons of this is, that the attention of the white population has been engrossed by other pursuits. The climate is exceedingly humid on the coast, and the mountainous character of the greater part of the land precludes extensive farming. Root crops—such as potatoes and turnips—as has been shown by many experiments, produce an abundant harvest, even as far north as the arctic circle. Much of the land is grass-covered and favorable to stock raising. This is true especially of Kodiak island and many of the islands westward, including the Aleutian chain. The summers in that region are too humid to admit of the curing of hay, but the preservation of fodder in a green condition is practicable, and, besides, the winter climate is so mild that cattle and sheep can graze almost throughout the year.

Reindeer.—Owing to the efforts of Capt. M. A. Healy, of the United States Revenue Marine, and Rev. Sheldon Jackson, reindeer have been introduced, at the expense of the General Government, into western Alaska, and they are reported to be thriving. The scarcity of food among the natives of central and western Alaska, owing to the marked decrease of large game since the introduction of firearms, will be counteracted when the natives are taught to raise and care for herds of domestic reindeer.

Explorations and Surveys.—Portions of Alaska are still unexplored, and only small areas, chiefly on the coast, have been accurately sur-

veyed. In recent years Government and private expeditions have traversed various portions of the country, following usually the river valleys, and have brought back much valuable information. Among these numerous expeditions, the most interesting and instructive are: A raft journey down the Yukon by Schwatka; exploration of Kowak river by Cantwell; of Copper river by Allen; of the head waters of the Yukon and an overland journey to Copper river by Schwatka and Hayes; of Chilkat pass and the country westward by Glave; of the St. Elias region by Russell; and of Glacier Bay by Reid. The United States Coast and Geodetic Survey has made careful determinations of the localities where the eastern boundary of the Territory crosses the Yukon and Porcupine rivers, and has also undertaken accurate surveys of several of the streams of southeastern Alaska, for the purpose of locating the disputed boundary. These surveys are still in progress. In the summer of 1895 an examination of the gold and coal deposits of southern and southeastern Alaska was begun by the United States Geological Survey.

Commerce.—The value of the exports of Alaska from 1868 to 1880, inclusive, as shown by the eleventh census, is as follows: Furs, \$48,518,929; canned salmon, \$9,008,497; salted salmon, \$603,548; codfish, \$1,246,650; ivory, \$147,047; gold and silver, \$4,631,840; whale oil, \$2,893,351; whalebone, \$8,204,067; total, \$75,213,929.

ANGLICAN CHURCHES. Statistical.—The statistical returns of the Church of England recorded in the Official Yearbook give evidence of continued vigor and progress. The voluntary offerings of Churchmen—excluding those which did not come under the immediate direction or cognizance of the clergy—for 1893 amounted to £5,650,490. Of this sum, £1,182,435 were spent on church building and restoration, £36,197 on burial grounds, £176,346 on the endowment of benefices, and £87,920 on parsonage houses. In Wales the total income of the clergy arising from tithe-rent charge, glebes, pew rents, fees, Easter offerings, interest on funded property, and from the Ecclesiastical Commissioners and other sources was £186,046, while the voluntary contributions for church work amounted to £240,643. Of the total amount collected in 1894 for the Metropolitan Hospital Sunday fund (£35,802) the Church of England contributed £28,369; and of the whole sum raised by the fund during the twenty-two years 1873 to 1894 (£695,504) the contributions from the Church of England were £334,995. The confirmations in 1894, reported from 2,738 centers, numbered 214,122. For the ten years preceding—1884 to 1893—the number of confirmations was 2,127,864; and for the previous ten years—1874 to 1883—it was 1,652,052.

Statistics of the Episcopal Church in Scotland for the year ending June, 1894, show that the congregations, including missions, numbered 303, and the membership of the Church had, as against the preceding year, risen from 96,251 to 99,971. The number of communicants during the same period had increased from 37,714 to 39,664. The amount raised by congregations, including income from endowments, was £90,850, as against £93,257 for the preceding year.

Societies.—The receipts of the Bishop of London's fund for 1894 were £24,708, or £1,743 less than in 1893. Grants were made during the year of £5,620 for clergy, £2,817 for lay agents, £7,476 for mission buildings, £6,758 for churches, £4,004 for vicarages and endowments, and £1,575 for schools.

The Incorporated Church Building Society, according to its report for 1894, holds 359 trust funds, amounting in all to £102,242 for the building and repair of churches. Its year's receipts were £4,481. It made during the year 89 grants of all kinds, amounting to £4,600.

The report of the Clergy Orphan Corporation, presented Feb. 20, represented the year past as having been one of steady progress as to the welfare of the society and its schools. The income had been £6,760 as compared with £6,241 in 1893. The Archbishop of Canterbury, presiding at the meeting, spoke of the necessity of securing the proper education of clergymen's children.

The report of the Continental and Church Society showed a gradual improvement in funds, with a total income for the year of £45,172, and several new and important developments in various parts of the world. Three new summer chaplaincies had been added—at Splügen, Stanserhorn, and Davos; and a lady had given £750 for the initiatory expenses of new chaplaincies. Particulars were given of the Church work helped by the society among the French Canadians and the scattered Indian and white populations of the Dominion, in Australia, South Africa, Mauritius, and India. Money and clothing had been sent to relieve the distress in Newfoundland.

The Central Church Committee has been organized, with the archbishops as joint presidents, with the object "of knitting together the great organization which has been established to consolidate the force of Church defenders and to further the cause of Church defense." The work of the committee is done wholly on Church lines. They have aimed at organizing the Church, the diocese, the rural deanery, and the parish. The Diocesan Committee has been asked to superintend the conduct of operations within the diocese. To the rural-deanery committees has been intrusted the duty of seeing that each parish forms its committee and keeps it in active work; and each parish has been asked to organize its own band of workers, who will see that to each adult is brought home the facts upon which the Church bases its claims for support. There are now committees in every diocese and in nearly every rural deanery, and 3,000 parishes are associated with the movement.

The general work of the Church Association was represented in the report presented at the annual meeting, April 29, as having been exceptionally successful. Eleven vans had visited during the year 2,882 villages, 15 counties had colporteurs, the sale of publications had increased, and the income had exceeded that of any former year. A resolution was adopted condemning the Church Patronage bills before Parliament as "a menace alike to the rights of property, to the independence of the clergy, and to the best interests of the Church of England."

The annual meeting of the National Protestant Church Union was held in London, May 21, Viscount Middleton presiding. The chairman

referred in his opening address to the steps the union had taken to bring the ritualistic manuals of devotion and service books under the notice of the authorities, and said that while they regretted to know that their memorial had been discussed at the meeting of bishops, they regretted that no practical answer had been returned to them. A resolution was adopted declaring that "this meeting, while fully realizing the imperative duty of promoting spiritual unity among Christian people, of whatever Church or denomination, upon the basis of Holy Scripture, is nevertheless profoundly convinced that any corporate union with the Church of Rome, so long as she retains her distinctive doctrines and advances her present claims, is visionary and impossible, and this meeting further desires to express its respectful thanks to the Archbishop of Canterbury for his recent clear and explicit statement upon the subject made to the Council of the National Protestant Church Union through their representatives." In another resolution the meeting expressed the opinion "that the time has come when the Council of the National Protestant Church Union should consider in what mode English Churchmen can best publicly assert their firm determination not to submit to the practical introduction into the Established Church of the doctrines and practices of the first Prayer Book of Edward VI, which have been deliberately rejected by lawful authority, and how also they can best resist the attempts which are now being made to promote reunion with the Church of Rome."

The annual meeting of the Society for the Liberation of Religion from the Control and Patronage of the State was held in London, May 2, and the triennial conference of the society was opened May 1. The report of the committee dwelt on the advance of Welsh disestablishment since 1892; commended the Welsh Disestablishment bill, then before Parliament, as a whole, while criticising some of its details. Referring to the position of the Scottish disestablishment question, the committee advised their Scottish friends to adopt means to quicken the action of the Government, and to counteract the strenuous efforts that would be made to defeat disestablishment candidates at the next election. Other measures in the direction of "piecemeal disestablishment" were touched upon, the educational work of the society was referred to, and the supporters of the society were urged to seize the present golden opportunity for new efforts to instruct the public mind and to appeal to the public conscience. The report maintained that there was profound dissatisfaction within the Established Church at the growth of sacerdotalism within its pale, as well as at the impossibility of obtaining from Parliament reforms required to secure the liberty which is the truth and life to a progressive church. The receipts of the society had been £5,630, and the expenditure £5,348. There was urgent need of increased resources to enable the society to take advantage of the present opportunity of influencing the public mind. Resolutions were passed appealing to English nonconformists to be true to their principles with the question of Welsh disestablishment; expressing the opinion that the Scottish Disestablishment bill should be introduced and pushed forward at

the earliest practicable period; urging determined resistance to all attempts to sectarianize board schools; and calling upon the advocates of religious equality to take steps for such educational work in the constituencies in view of the next general election as would secure the return of a House of Commons pledged to promote the policy of disestablishment.

Missionary Societies.—The income from all sources for 1894 of the Society for the Propagation of the Gospel in Foreign Parts was £122,327, being £9,248 more than the gross total for 1893. In the home work of the society, the standing committee had reorganized its sub-committee on home organization, which was now a large body in which every diocese was represented; and its duty would be to deal with the society's home work throughout the country, to select organizing secretaries, to hold conferences with those officers from time to time in the progress of their work, to consider all matters relating to deputations, to confer with the committees in the several dioceses as to organization, to take measures for encouraging devotional gatherings for missionary intercession, united efforts in the various rural deaneries with a view to the lessening of deputation expenses, and the development of clerical and other missionary associations. The London Missionary Clergy Association, in connection with the society, had given an impetus to the society's work in the London districts, and had led to the multiplication of similar associations throughout the country in great centers of population. The Board of Examiners had during the year considered the applications of 11 clergymen and 29 laymen for work abroad, and had recommended 9 clergymen and 23 laymen to the society. Twelve of these were for Africa, 11 for America and the West Indies, 5 for Asia, and 4 for Australia. The number of ordained missionaries on the society's lists, including 9 bishops, was 719, of whom 233 were in Asia, 173 in Africa, 18 in Australia and the Pacific, 209 in North America, 38 in the West Indies, and 39 chaplains in Europe. Of these, 125 were natives working in Asia and 45 in Africa. There were also in the various missions about 2,900 lay teachers, 3,200 students in the society's colleges, and 38,000 children in the mission schools in Asia and Africa. The spiritual side of the society's work presented details of difficulties and progress, of fears and hopes. It had been many years since wars had filled so large a space in the story of missions as in the past year. In China, Japan, Korea, Madagascar, and at Lebombo, in East Africa, there had been all the anxieties connected with wars and rumors of wars, but no word of quail from any of the missionaries. There were also brighter scenes in the society's mission field. Mashonaland and Matabeleland were in the enjoyment of a peacefulness such as they had probably never known under their old condition. In Basutoland, Kaffraria, and Zululand, the Church had taken root, and there were signs of growth. In Natal there was the happy drawing together of brethren long parted. Progress was recorded in other states of India. Of the 18 native clergy in the diocese of Lahore, 8 were converts from Mohammedanism.

The report of the Melanesian mission showed

that of the £6,000 annually expended, about £1,200 came from the endowment fund, largely bequeathed by Bishop Patteson. The bishop's stipend was £500, and the maximum income of the clergy was £200. The farms in connection with the training school on Norfolk Island furnished a considerable proportion of the provisions required, but not all. The mission now included 10 white and 8 native clergy, 200 teachers, and 3,000 pupils at 105 stations and schools. Bishop Wilson, who succeeded Bishop Selwyn, had been heartily welcomed by black and white alike. On his first voyage he had confirmed 500 persons, who had been mainly taught and kept together during the interregnum by native agency. The Australasian churches are furnishing a large proportion of the men and means for this mission. They had established new centers for English-speaking churches, and had spread Christianity among the Chinese immigrants and the aborigines. The mission in New Guinea had been fixed in a part of the territory where it would not interfere with the work of any other Christian body.

The financial report of the South American Missionary Society, presented at the annual meeting, April 25, showed a balance in the treasury of £174, besides £1,264 set aside for the Araucanian Mission fund. A legacy of £2,000 to the society was announced, and a gift of £50 for the work in Araucania. This claims to be the only large society working in the vast regions of South America.

The annual meeting of the Church Missionary Society was held in London, April 30, Sir John Kennaway presiding. The total ordinary receipts for the year had been £272,000, which was £20,000 in excess of the receipts of any previous year, while the expenditures had exceeded those of 1893 by only £960, a result mainly due to the continued fall in the price of silver. Adding special funds not available for ordinary purposes which had accrued, the society had received £279,084. Great satisfaction was expressed at the increasing number of missionaries, it having just doubled in the seven years from October, 1887, to October, 1894. It now included 349 ordained, 92 lay, and 193 woman missionaries, besides whom were 263 missionaries' wives, bringing the European total up to 897. The number of native and Eurasian clergy was 332; of native lay teachers, 4,529; of native Christian adherents, 204,107; of schools, 1,983, with 83,312 native pupils. The average of converts in the foreign field had been greatly exceeded, the total reported for the year being 4,200. These included 1,500 in India, 1,400 in Africa, and 650 in China.

The following memorandum on the episcopal authorization of laymen in the foreign mission field has been unanimously adopted by the committee of the Church Missionary Society:

(a) While it is desirable that all departments of the society's work should be carried on with the full sympathy and approbation of the chief pastor of the Church in each diocese, there is no sufficient reason for obtaining episcopal authorization of a general character for laymen to engage in spiritual work.

(b) There are, however, certain functions, ordinarily performed by clergymen, but in the mission field often necessarily performed by laymen, which may in some cases render desirable a special arrangement

with the bishop of the diocese. These functions do not include evangelistic work among the heathen, nor the instruction of Christians in Bible classes and the like, nor school work, nor medical work, nor literary work, nor other work of various kinds, such as is generally recognized as within the province of laymen. But they are: (1) The habitual conduct of public worship in settled congregations where there is no resident ordained pastor, and preaching to such congregation; and (2) the ministering from time to time by Europeans or others in congregations having ordained ministers in charge at the invitation of such ministers. A reasonable view of a bishop's responsibilities for the oversight of the flock committed to his charge justifies an arrangement by which his authorization should, if he desires it, be given to laymen for the performance of such functions as these.

(c) In accordance with the above principles, and upon the understanding that the conditions following are accepted, the committee will be prepared, in dioceses where it is the wish of the bishops to give such authorization to lay agents of the society, to enter into an agreement with such bishops defining the class of congregations to which these arrangements shall apply, and as to limitations of time, place, or qualification which may be deemed on either side to be of importance. The conditions referred to are the following: (1) That the authorization shall cover only the particular functions above described; (2) that they shall be given on the recommendation of the society's representatives in the mission field appointed for that purpose by the committee; (3) that official communications from the bishop to laymen thus authorized shall be made through the same representatives of the society.

(d) The committee must be distinctly understood as in no sense surrendering the inherent right and duty of Christian men to use all and every means of winning souls to Christ. The committee conceive that in the mission field no legal disqualification exists to prevent laymen performing even the official functions above referred to without episcopal authorization. Nothing, therefore, in this memorandum is to be interpreted as infringing upon the reasonable liberty of the society's lay missionaries to do so, either in cases of emergency, or even in ordinary cases in the earlier stages of missionary work.

The annual meeting of the Church of England Zenana Missionary Society was held in London, Aug. 3. The year's income had been £40,000, increasing the credit balance from £846 to £3,088. The society had 53 stations in India, 8 in China, and 1 in Ceylon; 175 missionaries in European connection and 78 in local connection, besides 640 native Bible women, teachers, and other workers.

The forty-third annual meeting of the Zenana Bible and Medical Mission was held April 18. The home income had been £18,247, and 45,857 rupees (£2,540) had been received in India from Government grants, fees, and subscriptions. The society employed 117 European missionaries and Eurasian assistants, 178 Christian teachers, nurses, etc., and 78 Bible women; and returned 70 schools with 2,896 pupils. It had access to 12,728 zenanas and private houses and 2,674 pupils under Christian instruction. The Bible women periodically visited 1,133 villages. At the society's hospitals and dispensaries in Lucknow, Benares, and Patna 19,152 patients had been treated, and the dispensaries had supplied 52,008 applicants. This society is supported by members of various churches.

The Convocations of Canterbury and York.—The Houses of Convocation met Feb. 6 for the dispatch of business. A petition was

presented in the upper house from the chairman of the National Protestant Church Union, bearing 1,750 signatures, in regard to the action of the Irish bishops in consecrating a bishop for the Reformed Catholics in Spain. The Bishop of London remarked upon this subject that the consecration was an act of very grave importance indeed, and one which the house wished very much, and had expressed its wish with distinctness in July, 1894, might have been postponed until after the Lambeth Conference of 1897 should have considered the subject. Upon his motion a resolution was adopted, reciting the resolution of the house of July 6, 1894, and the fact of the consecration of Sept. 23, 1894, and declaring that the house, "in accordance with the opinion expressed by the Lambeth Conference of 1878, and reaffirmed in the encyclical letter issued by the Lambeth Conference of 1888, declares its sympathy with the Spanish reformers in their endeavors to obtain blessings which the Church has long enjoyed. Yet, in view of the various issues involved in a recognition of the act performed as aforesaid, refuses to accept any responsibility in the matter until after the Lambeth Conference shall have examined the standards of doctrine of the said Reformed Church, and shall have decided the grave question whether the said Reformed Church is to be recognized as in communion with the Anglican Church." The approval of the house was given generally to the recommendations of the Archbishop's Committee on Voluntary Schools, and they were commended to the immediate and careful consideration of the whole Church. It appeared in the debate on this subject that the voluntary schools were laboring at present under the two difficulties of meeting the demands of the education department for improvements in buildings and of embarrassment in maintaining the schools in face of the perpetually increasing expenditure necessary for giving such instruction as the education department required. The work of the Free Education act had very seriously injured the financial position of a good many of the schools, taking away, as it did, the school pence. The question of the consecration of Bishop Cabrera in Spain was brought before the lower house for discussion in the form of a *gravesamen* which was offered, expressing disapproval of the act, and begging the members of the upper house to consider what steps should be taken to vindicate the integrity of the Church of England by shewing that it was clear of all responsibility in the matter, "and thus to alleviate the anxiety of many of her devoted members." Resolutions were adopted recommending steps to secure a simple and uniform constitution of ecclesiastical vestries; declaring it desirable that the obligations of church wardens to maintain and repair church burial grounds should not be transferred to parish councils without the sanction of the ordinary as well as of the parochial church authorities, and recommending the annual publication, for the information of parishioners, of statements of funds intrusted to incumbents and church wardens conjointly.

The House of Laymen passed resolutions opposing disestablishment and disendowment in Wales and Monmouthshire, on the subject of a simple and uniform constitution of vestries, and

concerning the appointment of church wardens; and approving the report of the archbishop's committees on Christian teaching in elementary schools. The bishops were requested to formulate a scheme for obtaining such further financial aid from imperial or local sources for voluntary schools as may seem most likely to meet their requirements without endangering their religious character, and to win the general support of the Church and the consent of the legislature.

The principal questions discussed at the meeting of the Convocation of Canterbury in May were Welsh disestablishment and the marriage of divorced persons. The former subject was debated in the upper house in view of the passage in the House of Commons of the Government bill on the subject. All the speakers regarded the proposed disestablishment as inequitable and likely to be disastrous to the Episcopal Church in England, as well as to religion in general. A resolution was passed in the lower house in view of the recent marriage in a church in London of a person who was respondent in an undefended divorce case, requesting the bishops to take such steps as they might think best to prevent the repetition of such a grave scandal, "by which the consciences of all really Christian people are wounded, the standard of morality in the country is lowered, the sanctity of family life sapped, and the blessing of the Church given to persons intending to live in a state which the Lord of the Church has directly and implicitly condemned. For all civil purposes what is desired can be obtained by a union in the register's office, and as it is state law and not Church law that makes such unions possible, the undersigned entreat your lordships to do whatever can be done to prevent such unions being ever solemnized in church, and to hinder her blessing being given to those whom Holy Scripture teaches that the Lord will not bless. Upon presentation of this resolution in the upper house, that body declared that it was fully prepared to take such steps as the members of this house may be able to take to prevent the recurrence of the scandal described in the *Articulus Cleri* of May 15, 1895. A report of a joint committee of both houses on the accession service was discussed in the upper house. It proposed amendments intended to remedy certain difficulties attending the use of the service.

The Convocation of York met Feb. 20. The report of the committee appointed by the two archbishops to inquire into the prospects of voluntary schools was considered in the upper house and approved, as was also the draft of the bill to amend the law relating to Church patronage. The lower house likewise approved the draft of the Church Patronage bill.

The Reformed Churches in Spain and Italy.—The memorial of the Protestant Church Union to the Archbishop of Canterbury, upholding the consecration of Bishop Cabrera in Spain by the Archbishop of Dublin and his associates, already mentioned as having been discussed in the Convocation of Canterbury, relates

That the Archbishop of Dublin had inquired of the Lambeth Conference of 1888, whether the primitive and established principles of jurisdiction would be safeguarded if such bishop as was contemplated, should refrain from assuming a territorial title or any

jurisdiction except over his own folk; and it was only on receiving an answer in the affirmative that he determined to proceed. The Church of England had been fostering the Spanish and Portuguese missions for many years. A Presbyterian agency had also been at work. "If the request for an episcopate had been delayed till after the next Lambeth Conference," the memorialists said, "the organization of the Reformed Church in Spain might have taken a non-episcopalian form, which would have increased the number of these non-episcopalian churches, the obstacles to full communion with which are now universally lamented." That there should be no bishops where "the unscriptural bishops of the Roman tyranny bear full sway appeared to the memorialists a monstrous proposition." We would further point out that what has been done for the Spanish reformers by the Irish bishops was done for the members of the Reformed Church in the United States by the bishops of Scotland, for the Reformed Christians in Mexico and Hayti by the bishops of the United States, and for the Old Catholic Bishops Reinkens and Herzog by the Archbishop of Utrecht. Bishop Cabrera occupies in Spain a position corresponding to that of the Anglican and other bishops in Jerusalem; of the Bishop of Gibraltar in the Roman Catholic dioceses of southern Europe; and of Bishop Wilkinson in the Roman Catholic dioceses of the north. We do not refuse the Roman Catholic bishops in England themselves a corresponding position, which, according to the principles of religious liberty and the unhappy divisions of Christendom, appears necessitated by the presence of 2,000,000 of that communion in this country. We do not think it necessary to defend to your Grace the principle that the Spanish Reformed Church should form its own liturgy, a principle common to Christendom since its earliest days, recommended by Gregory VII when sending Augustine to convert the Anglo-Saxons, and fully maintained by our own Church. We deplore the action of certain members of our own Church, who, without waiting for the guidance of our spiritual rulers, apologized to the Romish Archbishop of Toledo for the deliberate action "of the free and independent Church of Ireland, whose presence in Ireland is in itself a witness against the inveterate errors of Rome. Their action only drew from the Romish bishops a declaration of the impossibility that exists against the recognition of ourselves or of any other Reformed Church whatever; and in that declaration is added a yet further justification to the action of the Irish bishops. We have laid these reasons before your Grace because we are aware that petitions are being circulated in various dioceses with the object of securing a censure of the Irish bishops and the confirmation of the usurpations of Rome in Spain and in other countries, as well as a virtual perpetuation of those unlawful terms of communion which the Lambeth Conference of 1888 unanimously condemned."

An address was presented to the Archbishop of Dublin by nonconformist ministers, expressing lively interest in the reform movement in Spain, and admiration of his efforts, and comparing the situation in Spain to that in England in the time of Henry VIII, and in Italy now, where there were vast masses of people nominally connected with the Roman Catholic Church, but virtually outside its pale, from want of belief in its title and from disapproval of its influence. The signers of the address were impressed with the spontaneity of the Spanish movement, which, they said, was not the fruit of any foreign propaganda, but the logical outcome of men seeing for themselves. A meeting held in London, March 30, over which S. T. Fowell Buxton presided, and to which the Bishops of Worcester and Sodor and Man sent letters, while other dis-

tinguished Churchmen were present, expressed thanks to God for the success vouchsafed to the reformers in Spain and Portugal in carrying on their work, approval of the consecration of the bishop, and sympathy with the Irish prelates who had participated in the act. Another meeting, held April 4, at which Col. Saadys, M. P., presided, and the Bishop of Liverpool, in addition to the others, sent a letter, adopted a resolution of like tenor, with a declaration "that the position of Bishop Cabrera as head of the Reformed Spanish Church (due to his election by the people and clergy as far back as 1880, and to his subsequent ministry among them for the furtherance of the Gospel) entitles him to the prayers and support of English Protestants who, like himself, are under the ban of Rome, and desire to see a saving knowledge of Jesus Christ brought within the reach of every Spaniard."

The Archbishop of Dublin presided May 10 at the annual meeting of the Spanish and Portuguese Church Aid Society. The report referred at length to the consecration of Señor Cabrera as the first bishop of the Reformed Spanish Church, and the criticisms provoked by that step. The society's income had been £5,953, of which £4,637 had been spent and £1,128 placed in reserve. One half of the £3,000 required to complete the bishopric endowment had been raised. The archbishop defended his consecration of Bishop Cabrera, saying that it was not against canon law, which only necessitated the permission of his own Church and the invitation of the people to whom he went. Nor was it forbidden by the Lambeth Conference, which had declined to take the responsibility of passing on such matters. He had received from many bishops opinions in harmony with his own. The Archbishop of Dublin also presided at the annual meeting (May 22) of the Italian Church Reform Association. The annual report stated that the work started fourteen years ago, and had to be reorganized five years later, after much persecution. It was a work to which English Churchmen, Scotch Presbyterians, the Waldenses, the Old Catholics, and other reformed churches had all held out the right hand of fellowship. From all parts of Italy came requests for an increased pastorate and for the education of the converts' children in the principles of the reformed faith. The accounts showed an expenditure of £956 in Italy and £220 in England. Count Campello, the bishop-elect, had added to the list of his clergy the Rev. Bruno Bruni, who, with the bulk of the Methodist Episcopal congregation in Dovadola, had petitioned for reception. No attempt was made to withdraw reformers who were now in connection with non-episcopal bodies. The Bishop of Salisbury expressed his continued sympathy with the work of his old friend Count Campello. All he had seen of the count confirmed his belief in his high character and his fitness for the leadership of such a movement.

The Church Congress.—The Church Congress met at Norwich, Oct. 10. The Bishop of Norwich, as bishop of the diocese, presided. At the reception given by the mayor of the city previous to the opening of the meeting the Archbishop of York said that during the thirty-six years the congress had been in operation the

clergy had been brought into much closer relations with the people, and he trusted that the present meeting would also be fruitful in good results. The president in his opening address spoke of the present position of the Church as compared with its past; of the growth among Protestants of the different denominations of the desire for closer unity; of the internal condition of the Church; and of the reforms that are needed, mentioning particularly the provision of retiring funds for aged or incapacitated incumbents, and greater power for the Church in making its regulations or by-laws. Concerning the subject of Church unity, the speaker said that while there was no prospect of organic union with any of the nonconformist bodies, and there did not appear to be any strong desire on their part for such a union, the relations of the Church with them had "during the past thirty years been continually becoming more friendly, and friendliness and peace are only less blessed than absolute unity. And thus, indeed, the Church has gained more friends and even adherents. There has arisen, too, of recent years a very happy perception that in some all-important matters, as in the sacred cause of morality, we are working together with the utmost cordiality for the overcoming of sin and misery by the power of good." The first topic discussed was that of education, under the heads of "The Preservation of Religious Education in Elementary Schools"; "Federation for Schools"; the report of the archbishop's committee on the schools; a comparative view of the educational systems in their religious aspect of the United Kingdom and its colonies and protectorates; "National Education on the Continent of Europe and the Place occupied therein by Religion"; the position of national education in the religious aspect in England as compared with that in France; and the subject was continued under these and similar heads at other sessions. Concerning the relations of the Church and socialism, papers were read on the attitude of the Church toward socialism, toward trade-unionism, and toward co-operation. The discussions on foreign missions touched missions to the Jews, to the Japanese, to the Chinese. Home missions were considered with reference to "parochial missions" and "universities' and schools' missions," and an account was given under this head of the working of the Protestant Episcopal Brotherhood of St. Andrew in America as an organization for assisting the clergy and binding laymen together for the purpose of general social improvement. In the discussions concerning Holy Scripture, papers were read by Prof. A. H. Sayce, on "The Authority and Authenticity of the Old and New Testaments as affected by Recent Archaeological Researches"; by Mr. Theodore G. Pinches, on "Recent Archaeological Researches, especially in Egypt, Palestine, and Chaldea"; by Mr. F. C. Burkitt, on "The Sinaitic Palimpsest and the Greek Text of the Gospels"; and by Dr. Montague R. James, on the finds of Greek and Coptic monuments in the cemeteries of Egypt. The topic of "The Church's Ministry, Doctrine, and Worship, confirmed and illustrated by Recent Discovery and Research in the Catacombs and Other Sources" was discussed in papers on "The Christian

Prophets" and other special subjects. A session was given to the consideration of subjects pertaining to the finances of the Church. The duties of the Church were considered with respect to sailors and fishermen, and to soldiers. Under the general head of "Faith and Science" papers were read on "the religious problems pressing on the rising generation connected with the questions, first, of fixity of dogma, and second, of the progress of science. The topic of "The National Church" was discussed under the four heads of "its origin and growth," "its continuity, order, doctrine, and autonomy," "its continuity unbroken by the Reformation," and "what was done at the Reformation." Series of papers were read on "The Welsh Dioceses" and on "Hindrances to Christian Unity." Other papers were on "The Lord's Day—(a) Sunday Occupation, (b) Opening of Museums," "The Church's Care of Deaf and Dumb and Waifs and Strays," "The Utility of Cathedrals," "Church Music"; at the workmen's meetings, on "Tithes and Endowments," "Poor Law Administration," "Old Age Pensions," and "Benefit Societies"; and at the women's meeting, on "The Influence of Modern Life on Religious Faith, Work, and Amusement."

ARCHÆOLOGY. *American. Identity of the Mound Builders.*—The twelfth "Annual Report of the United States Bureau of Ethnology" contains a summary of the results of ten years' explorations of the mounds, carried on by the bureau under the immediate direction of Dr. Cyrus Thomas. During this time more than 2,000 mounds were explored between the Ohio valley and the Rocky mountains, and from the Dakotas to Florida. Particular attention was paid to the mode of construction and methods of burial in the conical tumuli. Many ancient graves and cemeteries and several *caches* and cave deposits were explored. As a rule, each mound was measured before it was excavated, and figured if it presented any peculiarity of shape. The character and thickness of the strata and the exact position of the skeletons and relics found were noted. About 40,000 objects were collected and catalogued, and were deposited in the National Museum. They include articles of pottery, an unusual number of polished and pecked celts, pipes, textile fabrics and matting, and bone implements used in weaving. The general conclusions are reached by Dr. Thomas that the links directly connecting the Indians and mound builders are so numerous and well established that archaeologists are justified in accepting the theory that they are one and the same people. The evidence obtained appears to be sufficient to justify the conclusion that particular works and the works of certain localities are attributable to particular tribes known to history, thereby enabling the archaeologist to determine in some cases, to a limited extent, the lines of migration: as in the case of works in Tennessee, western North Carolina, the Kanawha valley, and Ohio, attributed to the Cherokees; the box-shaped stone graves and the mounds and other works directly connected with them in the region south of the Ohio and near Cincinnati, attributed to the Shawnees; stone graves in the valley of the Delaware and others in Ohio of

which the Delawares were the probable constructors; and works of the Chickasaws in Mississippi, the Uchees in the Flint River region, southern Georgia, and the Muskogee tribes in the Gulf States. The testimony of these mounds is regarded as decidedly against the theory that the mound builders were Mayas or Mexicans, who were driven out of the regions by the pressure of Indian hordes, and also against Morgan's theory, that they were related to the Pueblo tribes of New Mexico. It also is interpreted as giving a decided negative to the suggestion that the builders of the Ohio works were pushed south into the Gulf States, and incorporated into the Muskogee group. While most of the ancient monuments belong to prehistoric times, and some possibly to a remote past, yet the evidence of contact with European civilization is found in so many of them and is such that we are forced to believe that a number of them were built after the discovery of the continent by Europeans. A number of interesting conclusions are also drawn respecting the tribal and territorial divisions, and the burial customs, with religious ceremonies, of the mound builders. Among these conclusions is one that in some of the southern districts, where the river bottoms are much depressed, it was the custom to erect dwellings on low mounds apparently constructed for this purpose, and when deaths occurred to bury the remains in the floor of these dwellings, burn the houses, and heap mounds over them before they were entirely consumed or while the embers were yet smoldering. The houses in these districts appear to have been constructed of upright posts set in the ground, lathed with cane or twigs, and plastered with clay, having the roofs thatched precisely as described by the early French explorers. No evidences of human sacrifice "in the true sense" were discovered. The statements of the navigators and explorers as to the habits, social condition, and art of the Indians when first visited by Europeans are largely confirmed by the discoveries. The works in Arkansas, Georgia, and other Southern States confirm, even to details, the statements of the chroniclers of De Soto's expedition, and of the early French explorers in the valley of the Mississippi.

English. *The Silchester Excavations.*—During six years that excavations at the ancient Roman site of Silchester have been continued, the forum and basilica, an ancient temple and what is believed to be a Christian church, an inn, baths, houses of different classes of society, and many interesting artistic remains rewarded the explorers. The plan of the city and the lie of its streets were traced with considerable exactness of detail, and the distribution of the inhabitants and the degree of civilization and comfort which they had attained could be conjectured from the remains. The excavations of 1894 involved the thorough examination of 64 acres, including 4 insulas or street squares. Many small articles of interest were discovered, including a hoard of 253 silver denaria of various dates, from Mark Antony to Septimius Severus, a range of about two hundred and fifty years. The most important discovery is that of a number of furnaces, apparently of an industrial character, and of various sizes, some circular and

some oblong. They were found partly within and partly without a series of rectangular inclosures or buildings. Twelve of these buildings were uncovered, all of the same type, and 31 hearths, 12 circular and 9 oblong. It is believed that these buildings and their adjuncts were devoted to the dyeing industry, and this conjecture is made probable by the large number of wells discovered, one of which was of peculiar and unusual construction. The circular furnaces are supposed to have been used for dyeing, while others, with a straight flue, may have been intended for drying. Rooms are traceable which, it is presumed, were intended for the storage of goods and materials, and open spaces with no remains of flues which may have been used for bleaching grounds. It is thought that these furnaces belong to the later period of the city, and the traces of successive occupation lead to the conjecture that the richer inhabitants left the district in which this industry was carried on and migrated eastward. The theory is strengthened by the discovery *in situ* of a number of querns for hand grinding the madder roots used for dyeing purposes. In the season of 1895, a hitherto unexplored insula, midway between the basilica and the west gate, was examined, and proved to be occupied by the foundations of two very large houses, the most interesting features of which were the elaborate mosaic pavements of the rooms.

Lake Villages. It appears from the third report of the committee of the British Association on the lake village of Glastonbury that during the year 15 more dwelling mounds and 500 feet of palisading had been disclosed, and nearly two thirds of the border had now been traced. Many valuable relics had been obtained, among which were a flint saw, a complete ladder 7 feet long, a small door of solid oak, and an oval bronze mirror, a feature of late Celtic art. The pottery was abundant and ornamented in late Celtic style, uninfluenced by Roman art. Hence the discovery of this lake village could not fail to shed light upon one of the obscurest periods of British art.

A station has been discovered in Bosnia, at Butmir, in what was probably in former times partly a lake basin. The more or less stratified beds of clay, charcoal, ashes, and mold disclosed on section, contained fragments of pottery, flint implements, stone axes, and other remains of a primitive people. A number of irregularly shaped hollows occurred on this clay, which Mr. Radinaki, who explored the station, thinks may have been the foundations of the huts of the first inhabitants, or diggings for making implements and for use in house construction. Some burned-clay coatings of the timbers of which the houses were constructed were found in several places. The remains were so abundant as to suggest that the people may have carried on special industries for their manufacture. Stone implements in the form of knives, arrow heads, scrapers, axes, and tools were in all stages of manufacture. The material out of which the perforated axes were made was not found in the neighborhood. The pottery was ornamented with a great variety of designs, among them a spiral. A number of clay images or figures representing the human form were

found, among them a head of terra cotta, which disclosed art of a superior kind. Prof. W. M. Flinders Petrie characterizes the specimens of black pottery found here as identical with pieces which he had found during the year in Egypt, and at other times at Hissarlik and in Spain.

Grecian. *Work of the American School.*—The work described in the thirteenth "Annual Report of the American Classical School" at Athens includes the discovery near the theater of a platform about 75 feet by 40 feet, composed of 3 layers of stone about 4½ feet thick, near which were found traces of fire, handfuls of charcoal, and bits of melted iron, and diverging from which were the remains of conduits, with remains of columns of what was probably an altar, some of which bore inscriptions indicating memorials of victory in theatrical contests. The platform seemed to be the stereobate of a temple. The excavations at Argos promise to be of great importance, and the structures uncovered have readily assumed larger proportions. Articles of art and handicraft have been found 15 feet below the previous year's level. Near a new-found Cyclopean wall were dug up large masses of pottery, iron, and bronze, a marble head of the Roman period, and an interesting specimen of Greek sculpture, the head of an Ephebus from the metopes of the second temple, bearing the characteristics of the Polyclitan art. Many objects in iron were disclosed, as well as bronze and even stone implements. A strange object was a large mass of iron about 5 feet long and a foot in diameter, which proved to be a mass of iron spears bound together with bands of iron at both ends. The west building, partly excavated in the previous year, was entirely uncovered, and showed a structure with 3 chambers, colonnade, and central court. Annexed to it was another long building at which were found the face of a colossal female head, objects in gold and silver, and a silver ring studded with gold and inscribed. The discoveries made at the east end of the west building are described as being very rich in number and variety, comprising every material—objects in gold, lead, iron, bone, ivory, and clay—and touching upon every field—epigraphy, art, mythology, and antiquities. At another part of the building some early graves of the Mycenaean period were found, one of them well preserved. Great interest was attached to the discovery of 2 beehive tombs, one of which had been the repository for at least 3 corpses, and contained 48 vases, nearly all in perfect preservation, 3 terra-cotta figurines of the earliest type, a chain with interesting Mycenaean ornaments, 4 steatite whorls, an ivory needle, and a number of beads; while the other contained a large number of beads and whorls, but only 1 complete vase, and a number of fragments.

The work of the school was continued in 1895 in the second temple of Here at Argos, which is regarded as second in artistic importance only to the Parthenon.

Roman. *The American School.*—A congress of philologists and archaeologists which met in Philadelphia in the winter of 1894-'95 recommended the organization of an American school of classical studies at Rome, on a plan similar to that of the school at Athens. A managing

committee was organized, generous subscriptions were received, and arrangements were made for opening the school, under Prof. William G. Hale as director and Prof. A. L. Frothingham, Jr., as associate director, for the academic year 1895-'96. The objects of the school will be to promote the study of such subjects as Latin literature as bear on customs and institutions; inscriptions in Latin and in the Italic dialects; Latin palaeography; the topography and antiquities of Rome; the archaeology of ancient Italy (Italic, Etruscan, Roman), and of the early Christian, mediæval, and Renaissance periods. It will furnish regular instruction and guidance in several or all of these fields, will encourage original research or exploration, and will co-operate with the Archaeological Institute of America, with which it is affiliated.

Egyptian. *Relics of a Hitherto Unknown Race.*—The work of Mr. W. M. Flinders Petrie during the season of 1895 and that of the Egyptian research account under the immediate direction of Mr. Quibell were carried on in the same district and were much interwoven with each other, so that it is not always easy to distinguish in the important discoveries that were made to which party the chief credit should be given. On the top of a plateau, according to Mr. Petrie's account, between Ballas and Negadeh, about 30 miles north of Thebes, 1,400 feet above the Nile, the home of palæolithic man was found. Large massive flints, beautifully worked and unworn, were discovered of the same forms as those found in the river gravels of France and England. Their antiquity is shown by their dark staining, while other flints five thousand years old by the side of them show hardly a tinge of weathering. Besides these other flints of a later palæolithic type were found imbedded in the ancient gravels of the former high Nile. A town of historical times, Nubt, found on the edge of the desert adjoining a small temple, proved to be a center of the worship of the proscribed god Set. This town is referred to in Juvenal in a passage which was hitherto obscure, but is now explained by the discovery; and besides its classical interest it preserves the remains of many successive ages, furnishing, in different layers, potteries of the fourth, twelfth, eighteenth, and nineteenth dynasties. Less than a quarter of a mile from this place lay another site of a town presenting special features that marked it as not Egyptian, but as having been the home of another race or people, whose presence in Egypt had not been known before, or even suspected. In the monuments and tombs of this people of a hitherto unknown race, nothing was found that was common to the Egyptians or was like anything Egyptian; and the region in which they were found extends over more than 100 miles of country, from Abydos to Gbelen. At the spot where the principal researches were carried on between Ballas and Negadeh, near the middle of the district, these remains occurred in the immediate vicinity of Egyptian towns and tombs with pottery, beads, and scarabs of the fourth, twelfth, eighteenth, and nineteenth dynasties, exactly like those found similarly dated in northern Egypt, yet wholly distinct from them. The men of this race, Mr. Petrie says, were "very

1. Ancient Galley, painted on a Vase, with hills and oarlocks.
2. Figure with tattooing marks on body.
3. Figure showing type of art followed by the New Race.
4. Portion of an Ivory Comb, with human head.

5. Ivory Comb.
6. Head of a bull, supposed to have held charcoal as a fire-warmer.
7. Skulls of New Race, with hair still remaining.

8. Slate Tablet, used to grind malachite, with which this race of people painted their eyes and faces.
9. Porphyry Vase, hand made.
10. One of the marks scratched on pots, supposed to be the nearest approach to writing practiced by the New Race.
11. The Game of Khnopshu.

tall and powerful, with strong features; a hooked nose, long-pointed beard, and brown, wavy hair are shown by their carvings and bodily remains. There was no trace of the negro type apparent, and in general they seem closely allied races of the Libyans and Amorites. Their burials are always with the body contracted, and not mummified, lying with head to south and face to west, just the reverse of the contracted bodies at Medum. Although most of the graves have been disturbed, yet sufficient examples remain untouched among the 2,000 graves opened by us to show that the bodies were generally mutilated before burial. One large and important tomb showed four skulls placed between stone vases on the floor, a separate heap of loose bones of several bodies together, and around the sides human bones broken open at the ends and scooped out. Such treatment certainly points to ceremonial anthropophagy. Other graves are found with the bones separated and sorted in classes. The type of the graves is like that of those of the circle at Mycenæ—open square pits, roofed over with beams of wood. They are always, by preference, in shoals of water courses, showing that the race came from a rocky country, where excavation could not be made except in alluvium. The great development of the legs points to their having come from hills, and not from a coast or valley. The frequency of forked hunting lances shows their habit of chasing the gazelle. Metal and flint were both in use by these people. Copper adzes show that wood was wrought, and finely carved bulls' legs to a couch illustrate the work. Copper harpoons were imitated from the form in bone. Copper needles indicate the use of sewed garments, and the multitude of spindle wheels in the town proves how common weaving must have been. Flint was magnificently worked far more elaborately than by the Egyptians of any age; the splendid examples in the Ashmolean and Pitt Rivers Museums at Oxford are now seen to belong to this people. Both knives and forked lances are found. Stone vases of all material, from alabaster to granite, were favorite possessions; they are beautifully wrought, but entirely made by hand, without any turning or lathe work. A very puzzling class of objects long known in Egypt are the slate figures of birds and animals, rhombi, squares, etc. These now prove to be the palettes for grinding malachite, probably for painting the eyes, as among Egyptians of the fourth dynasty. Beads were favorite ornaments, and were made of carnelian, lazuli, transparent serpentine, and glazed stone. Pottery was the favorite art of these new people; the variety, the fineness, and the quantity of it are surprising. Few graves are without ten or a dozen vases, sometimes even as many as eighty. Most of these are of the coarser kinds, merely used for containing the ashes of the great funeral fire, for though the bodies were never burned, a great burning was made at each funeral, the ashes of which were carefully gathered and preserved, sometimes as many as 20 or 30 large jars full. . . . The varieties of pottery are the polished red hematite facing, the red with black tops (due to deoxidation in the ashes), and the light brown with wavy handles, like the Amorite pottery. A later stage of pottery was

of coarser brown, and of much altered forms, copying somewhat from Egyptian temples of the old kingdom. The wavy-handled jugs went through a series of changes, forming a continuous scale by which their relative ages can be seen. Animal-shaped vases and many curious sports are found in the red-faced pottery. Besides these forms, three kinds of pottery seem to have been imported: buff vases imitating stone, with red spirals and figures of animals and men; red polished vases with figures of animals and patterns in white; and black bowls with incised patterns, most like the earliest Italic pottery. Besides these designs, a great variety of marks are scratched on the local pottery; but not a single hieroglyphic or sign derived from Egyptian writing has been found. Another fact showing the isolation of these people from the Egyptians is that all of this fine pottery is hand made; the wheel was unknown." While the source of this new race can not yet be determined, some of the objects point strongly to an Amorite connection, and others indicate a western source; but the Amorites were, as Mr. Petrie suggests, probably a branch of the fair Libyan race. The geographical position is all in favor of the race having come into Egypt through the western and great oases, for the seventh and eighth Egyptian dynasties were still living at Memphis, showing that no people had thrust themselves up the Nile valley. The age of the new race is fixed by the juxtaposition of their burials with those of the fourth and the twelfth dynasties, and of their towns with burials of the twelfth and thirteenth dynasties; and the known history further limits the date to between the seventh and ninth dynasties, or about 3000 B. C. The account of the discovery given by Mr. Quibell is parallel with Dr. Petrie's, and in harmony with it; and these two authors agree in the supposition that the people of the new race were Libyans who invaded Egypt at or after the close of the sixth dynasty—perhaps, Mr. Quibell suggests, they were the foreigners who subverted the old empire.

Antiquities from Deir-el-Bahari.—An exhibition of articles from the temple at Deir-el-Bahari given in London in July included many objects of novel interest and value dating from about 1400 B. C. Among them were a series of tools, models, and vases which had been marked with the name of Queen Hatshepsu, or Hatasu, and deposited below the foundations of the temple. The metal blades of the tools are of bronze, and the handles and wooden objects of sycamore. There were besides these jars of unglazed red ware, pots of alabaster with original covers, wooden models, probably of thrashing sledges, wooden hoes, the leathers of which were found in bundles close by; adzes, adze handles, stands of basket work for jars, a sacrificial knife and axe, and blue scarabei of the queen. A number of large painted coffins contained complete all the accessories of burial—the bead nets with genii in blue beadwork on the breasts of the dead; the wooden hawks and jackals, symbols of Horus and Anubis, on guard over the coffins; and the wooden boxes filled with blue *ushabti* figurines at the feet. The mummies in them are those of a priest of Khonsu, his mother, and her sister; and all were found together in a pit.

excavated at a later period than the queen's in a corner of the temple, and preserved by the collapse of the roof above. A curious illustration of an ancient Egyptian belief is afforded by a child's coffin having a pair of baby shoes buried with it. The shoes are cut in two to render them useless to a spoiler, while they would remain as good as ever for the child's use in a spirit world; the parents believed that the child would carry and wear its shoes alternately on its ghostly journey, as they carried and wore theirs (and the *fellahia* does still) on earth. Near the coffin was another small one, containing a rudely cut witch-doll. Some Coptic objects in the collection may cast light on ancient Christian customs and ritual. A number of late Coptic breast clothes afford evidence of the survival of the practice of mummification far into Christian times. One of a large number of *ostraka* contains matter bearing upon the controversy as to the remarriage of divorced persons.

Archæological Work at Alexandria.—An archæological exploration of the ancient city of Alexandria has been made by Mr. D. G. Hogarth, on behalf of the Egyptian Exploration Fund, without revealing any promise of important discoveries. The central part of the old Roman city has been found to be covered with a deposit from 15 to 30 feet thick, mostly composed of Arab living refuse, containing no objects of interest. Such remains as exist of the Roman town are in very bad condition, and exhibit everywhere the appearance of having been ruined and rifled systematically, while immediately below this water is tapped, and indications are found that the soil has subsided. Mr. Hogarth is convinced that no great mine of museum treasure remains to be explored under Alexandria; that its libraries have perished utterly; and that all the monuments have been destroyed or robbed of what could give them value and interest.

The excavations of Dr. Botti, the Director of the Alexandria Museum, in the neighborhood of Pompey's Pillar, have resulted in the discovery of the Serapeum, where the last of the great libraries of Alexandria was preserved. The discoveries include the *picina* of the fountain of the Acropolis, with the channels cut through the rock which conducted the water to it; inscriptions of the time of Hadrian and Severus, dedicated to "Serapis and the deities worshiped with him in the temple"; remains of gilded ornaments and a bull of fine workmanship, all of which came from the great central court; a few tombs; and long subterranean passages cut through the rock under the site of ancient building, and once accessible from the court. The passages are broad and lofty, and were originally faced with masonry. Here and there are niches in the rock for the lamps which illuminated the passages.

Exploration of Philæ.—The Egyptian Council of Ministers has approved a proposal by M. Garstin for clearing Philæ of *débris* in order to make a thorough examination of the bases of the temple, and explore the subterranean passages that intersect the island. The work will be done by the Public Works Department, an officer from the Antiquities Department attending to insure that all objects of interest are preserved.

Babylonian.—The possible age of the ruins in the valley of the Euphrates has been estimated by Dr. J. P. Peters, of Philadelphia, who has excavated in the region, on the basis of the rate of alluvial deposits. The deposits from the known date of Alexander's conquest display marked uniformity. Taking the depth of these as a standard, the foundations of Ur (the modern Machair) and of Eridu (the modern Abu-Shahrain) must have been laid about a. c. 7000.

The Black Obelisk of Shalmaneser II.—The inscriptions and sculptures on the black marble obelisk of Shalmaneser II discovered by Layard at Nimroud in 1846, and preserved in the British Museum, prove to be important. They record a campaign undertaken by Shalmaneser against Hazael, of Damascus. An epigraph attached to one of the groups of figures—which in all occupy 20 panels—records the submission of Jehu to the Assyrian king and his consent to pay him tribute. The group itself represents Jehu prostrate before the great king, accompanied by his ambassador. On other panels his attendants are depicted bearing in their hands and on their shoulders the articles of which the tribute is composed. Two Assyrian officers introduce Jehu and his envoys. One of these holds in his hands a scroll, from which he reads the proffered submission and the list of articles offered by the Jewish king. The physiognomy of these personages is characteristic.

Ancient Babylonian and Hebrew Literature.—In a paper read in the Anglican Church Congress at Norwich Prof. A. H. Sayce presented some of the results of his studies with those of other Orientalists of the collections of cuneiform texts and other ancient documents which have been collected during several years past in researches prosecuted in Egypt, Syria, and Mesopotamia as bearing on the credibility of the Old and New Testaments. These documents are very numerous, and a considerable proportion of them date back to a period several centuries anterior to the time of Moses. Of the general bearing of the testimony they afford, the author said that we now know that the Mosiac age in the East was a highly literary one, and that it would have been a miracle if the Israelites, whether in Egypt or in Canaan, had not shared in the general literary culture of the time. In the century before the Exodus an active correspondence was constantly going on from the banks of the Nile to those of the Euphrates, and this correspondence was in the foreign language and foreign script of Babylonia, necessitating the existence all over the civilized East of schools and libraries, of teachers and pupils. The antiquity of Babylonian literature was equally great. The chief cities of the country boasted of their libraries, some of which had been founded six thousand years ago, and at the very time when Abraham was born in Ur of the Chaldees one of its poets was composing a great epic in 12 books, which formed the close of a long preceding period of epic verse. So far as the ancient East is concerned, we can not too soon rid ourselves of the notion that literature is a modern invention. Moses, then, could have written the Pentateuch, and those to whom it is addressed could have read and understood it. The books of the Old Testament are but a fragment of the Hebrew

literature which once existed, and, even apart from possible corruptions of the text, the meaning of numerous Hebrew words and grammatical constructions is merely a matter of conjecture. The Assyrian monuments have already proved helpful in determining the signification of Hebrew words, and have also cast light upon the manner in which the biblical books were composed, and upon the authenticity of the materials that enter into them. Contemporaneous documents are continually being discovered which attest the truth and historical character of the statements in Genesis. Thus a direct and complete confirmation has been furnished of the historical accuracy of the story of the campaign of Chedorlaomer and his allies against the Canaanites in a series of tablets relating to military events in that region, in one of which King Eri-Aku (Arioch), of Larsa (Ellasar) is associated with the Princes Kudur-Lagamar (Chedorlaomer) and Tud-Khal (the Tidal of Genesis). In connection with the overthrow of Eri-Aku, and the Elamites by Khammurabi, the rival king of Babylon, recorded in other tablets, Mr. T. D. Pinches has found that the names of the kings of the dynasty to which Khammurabi belonged are not Babylonian or Assyrian, but present curious resemblances to Hebrew names, as well as to south Arabian names; and he has found in contract tables dated in the reigns of Khammurabi and other kings of the dynasty the names of Yakub-ili and Yasup-ili, or Jacob-el and Joseph-el. The names, Prof. Sayce says, "are distinctively Hebrew, and prove that in the very century in which the Bible assigns the lifetime of Abraham Hebrews with Hebrew names must have been living in Babylonia." The Egyptian monuments of the eighteenth and nineteenth dynasties mention places in Palestine called Jacob-el and Joseph-el, and Prof. Flinders Petrie found in 1894 a scarab bearing the name of a Pharaoh, Jacob-el, who must have reigned over Egypt in the obscure period when it was ruled by Asiatic conquerors. The name Abram, further, had been already noted in Babylonian contracts of the time of Eri-Aku or Arioch. The relationship of the names of this dynasty both to Hebrew and to south Arabian names may, moreover, be taken to indicate that the Hebrews and the tribes of southern Arabia had a common ancestor, and that their common meeting place was in Babylonia; in illustration of which we read in the tenth chapter of Genesis that "Unto Eber were born two sons," one of whom was Peleg, the ancestor of Abram, and the other was Joktan, the ancestor of the tribes of southern Arabia.

ARGENTINE REPUBLIC, a federal republic in South America. The President is elected for six years by electors chosen in the several provinces. The National Congress consists of a Senate and a House of Deputies. There are 30 Senators, elected one third every two years, for six years by the legislatures of the 14 provinces, except the two representing the capital district, who are chosen by an electoral college. There are 86 Deputies, of whom one half are renewed every two years. They are elected by direct popular suffrage. The President of the republic for the term ending Oct. 12, 1898, is Z. S. Uriburu, who, as Vice-President, succeeded Dr.

Saenz Peña when the latter resigned, on Jan. 22, 1895. The following Cabinet was in office in the beginning of 1895: Interior, M. Quintana; Foreign Affairs, Dr. Eduardo Costa; Finance, Dr. J. A. Terry; Justice, Worship, and Instruction, J. V. Zapata; War and Marine, Gen. L. Campos.

The area of the country is 1,125,086 square miles. The population was estimated at 4,257,000 in 1892. The census of 1895 makes it over 4,750,000. The population of Buenos Ayres, the capital, in 1895 was 620,000, over 25 per cent. of whom were foreigners. The number of immigrants who arrived in 1893 was 84,420; the total net immigration since 1873 was 1,116,000. Among 52,067 immigrants who landed at Buenos Ayres in 1893, Italians numbered 37,977, Spaniards 7,100, French 2,612, Germans 966, Russians 748, Austrians 685, others 1,979. More than one fifth of the total population are of foreign birth, mostly Italians, French, and Spaniards. There are also many English and German settlers. The immigration, which fell off on account of the financial crash from 260,909 in 1889 to 138,407 in 1890, and lower still in the succeeding years, began to recover in 1893. Immigration from the British Islands, however, continued to decline.

FINANCES.—The actual revenue for 1893 was \$31,909,953 in gold and \$108,801,225 in paper; the expenditure was \$31,303,149 in gold and \$97,627,956 in paper. The revenue for 1894 was estimated at \$34,193,400 in gold and \$20,280,000 in paper, and expenditure at \$18,418,000 in gold and \$66,033,380 in paper. The actual receipts were \$27,790,500 in gold and \$24,861,412 in paper. For 1895 the gold receipts are estimated at \$34,373,000, of which \$28,800,000 are import duties, \$2,500,000 export duties, \$700,000 storage duties, \$840,000 harbor dues, \$150,000 consular taxes, \$220,000 charges for statistics, and \$1,163,000 interest. The revenue paid in paper currency is estimated at \$23,825,000, of which \$1,600,000 are land taxes, \$6,600,000 stamp duties, etc., \$3,350,000 postal and telegraph receipts, \$4,820,000 railroad receipts, etc., \$6,930,000 excise duties, and \$525,000 miscellaneous receipts. The expenditure for 1895 is estimated at \$18,418,300 in gold and \$61,777,574 in paper, divided as follows: Congress, \$1,969,016 paper; Interior, \$2,644,800 gold and \$18,670,373 paper; Foreign Affairs, \$159,960 gold and \$733,934 paper; Finance, \$15,613,540 gold and \$7,343,169 paper; Justice and Worship, \$10,267,291 paper; War, \$14,623,128 paper; Marine, \$8,170,653 paper.

The external debt in December, 1894, amounted to \$219,020,172, payable in gold. The total funded debt was \$262,033,716 in gold and \$46,500,794 in paper, entailing an annual charge of \$11,193,491 gold and \$2,100,000 paper. The total indebtedness of the Government in January, 1894, was \$416,778,905 in gold and \$63,980,376 in paper. The external provincial debts in 1894 amounted to \$131,000,000 in gold, with \$21,000,000 interest in arrears and the municipal debts to \$24,596,422 in gold, with \$697,081 unpaid interest.

The Army and Navy.—There is a regular army of 1,398 officers and 6,498 men and a National Guard, in which 480,000 men are enrolled, of whom not more than 65,000 have received

military training of any kind. The military academy has about 150 cadets. Connected with it is a school for noncommissioned officers. In the naval academy about 60 cadets are in training, and 80 men in a gunnery school. The navy consists of 3 armored cruisers, 2 second-class cruisers, 12 of the third class, 2 monitors, and 8 first-class and 6 second-class torpedo boats. Of the armored cruisers, the "Almirante Brown," of 4,200 tons displacement, has 9-inch plates, carries 8 12-inch Armstrong guns, and has a speed of 14 knots; the "Libertad" and "Independencia," of 2,500 tons displacement, carry 9½-inch Krupp guns in pairs in a barbette, besides 4 4½-inch quick-firing guns, and have 8 inches of armor on the sides. The cruiser "9 de Julio," of 3,575 tons displacement, has made 21½ knots at natural draught, and is armed with 12 6- and 4½-inch quick-firing guns. The torpedo gunboat "Aurora" steams 18½ knots, and the new "Patria," of 1,188 tons, armed with 2 4½-inch and 6 small quick-firing guns, can make 20½ knots with forced draught. Naval commissioners were sent to Europe in 1895 to purchase cruisers to be added to the navy. They acquired the Italian "Garibaldi," rechristened the "San Martin."

Commerce and Production.—The value of the merchandise imports for 1893 was \$96,105,359 in gold, and of the exports \$92,703,834. Of the imports, \$32,509,344 were textile fabrics and apparel, \$10,724,015 food substances, \$13,055,393 iron and manufactures thereof, \$8,341,895 beverages, \$4,889,389 timber and wood manufactures, \$3,279,688 paper, \$2,360,451 pottery and glass, \$6,868,085 coal and oil, and \$4,095,902 chemicals. Of the exports, \$52,997,619 represent animals and animal products, \$29,017,260 agricultural products, \$4,769,713 manufactures, \$2,351,192 forest products, \$362,446 mineral products, and \$3,305,604 miscellaneous products. The export of wool was 123,230 tons; of sheepskins, 25,569 tons; of wheat, 1,008,137 tons; of Indian corn, 84,507 tons; of meat, 68,371 tons. The imports of gold and silver amounted to \$4,688,638, and the exports to \$815,585. The value of the trade in 1893 was as follows:

COUNTRIES.	Imports.	Exports.
Great Britain.....	\$32,522,168	\$18,561,905
France.....	12,114,164	18,228,465
Germany.....	11,009,865	10,472,296
Belgium.....	9,083,756	10,999,321
United States.....	9,610,964	8,416,740
Italy.....	9,218,984	3,890,167
Brazil.....	2,117,877	12,068,650

Imports from Germany, Belgium, Italy, and the United States showed a considerable increase, while those from Great Britain fell off slightly. In 1894 the imports from the United States continued to increase, although those of other countries declined. A new tariff adopted by the Argentine Congress in February, 1895, is favorable to the trade of the United States. There are reductions on many products and manufactures of this country. The new duties on some of these are: Farm wagons, 10 per cent. *ad valorem*; binding-twine, 5 per cent.; plows, 5 per cent.; mowing-machines, 5 per cent.; resin, 5 per cent.; wood pulp, 2½ per cent.; canned fruit or vegetables, 15 cents in gold per kilo;

fruits in sirup, 27 cents; lard, 8 cents; kerosene, 1½ cents a litre. The duty on pine lumber is considerably reduced, while coal and coke and also locomotive engines, thrashing-machines, with or without motors, and binders and headers are made free.

The trade in jerked beef and cattle with Brazil, Cuba, and other tropical countries has recently been supplemented by a more important trade in frozen meat and fatted beeves with England, Chili, France, Germany, and Belgium. To produce beef cattle for the new markets the native *criollo* stock has been crossed with shorthorns and Herefords, of which breeds thousands of pedigreed bulls have been imported. In no other country can cattle and sheep be raised and fattened as cheaply, on account of the rich natural grasses and the exceptional climate, in which animals can be fattened in the open air in winter in wire-fence inclosures. Four-year-old graded steers raised on the prairie grasses and fattened on alfalfa or lucern, receiving no grain at all, have brought £25 a head in England. A class of middlemen, mostly English, have taken up the business of fattening cattle for export, sending the heaviest of the *criollo* cattle across the Andes to Chili, graded animals weighing about 1,150 pounds to Brazilian ports, and the finest and fattest steers to England. They have not brought as much within 1d. or ½d. a pound as North American corn-fed cattle, because they are wilder and less uniform in size, age, and quality, and because the grass-fed meat, though good, is not as bright in color. The Argentine sheep are as good as Canadians, and butchers classify them together and pay 6d. a pound for both kinds. The alfalfa district, about 20,000 square miles in extent, has been taken up by the English graziers. In other parts of the country alfalfa can be grown only by the aid of irrigation. The export of live cattle and sheep in 1894 was officially valued at over \$5,000,000. The imports of meat and live stock into England during the same year included 1,675,600 frozen sheep and 29,000 quarters of frozen beef, besides 90,000 live sheep and 28,000 bullocks from the Argentine Republic. The production of wheat has greatly increased. In 1893 the crop was 56,725,000 bushels. The cultivation of maize also has been extended until there is a considerable surplus available for export.

The trade returns for 1894 made the total value of imports \$92,800,000 in gold, and that of exports \$101,700,000.

Navigation.—The number of vessels engaged in foreign trade entered at Argentine ports during 1892 was 9,948, of 6,046,800 tons, of which 7,298, of 5,336,700 tons, were steamers, and 2,650, of 710,100 tons, were sailing vessels. Of the total number, 4,399, of 1,672,400 tons were Argentine. The British tonnage was 2,723,900 tons.

Communications.—There were 8,156 miles of railroad in operation in 1894, in which \$399,457,906 in gold were invested. The receipts in 1893 were \$66,723,326 and expenses \$39,538,490. The lines owned by the Federal Government represented \$42,107,501 of the invested capital; guaranteed lines, \$83,259,321; lines built by companies, \$224,717,783; lines aided by the

provincial governments, \$49,873,900. New lines and extensions have been authorized to the extent of 3,170 miles. About \$300,000,000 of European capital is invested in Argentine railroads.

There are 30,415 miles of telegraphs, of which 11,350 miles belong to the Federal Government, 8,000 miles to railroad companies, and 1,115 miles to cable companies. There were 2,500,000 messages transmitted in 1893.

The post office in 1893 forwarded 123,618,580 domestic and 18,500,000 foreign letters. The Government derived a net revenue of \$2,085,580 from the post office and \$1,005,280 from the telegraphs.

Resignation of the President.—A conflict arose in the beginning of the year between Congress, which had been called together in extraordinary session to consider financial and other proposals, and President Saenz Peña. The Congress sanctioned an expenditure of \$2,000,000 in gold for war material in view of the possible complications with Chili on the question of boundaries. The Minister of Foreign Affairs resigned and Dr. A. Alcorta reluctantly accepted the portfolio on Jan. 9. A bill was passed granting a five years' moratorium to the Provincial Mortgage Bank, authorizing it to suspend the payment of coupons and to allow debtors to cancel gold cedulas with currency cedulas of any series at the rate of two of the latter for one of the former. By a voluntary arrangement between the British creditors and the cities of Rosario, Santa Fé, and Cordova those municipalities obtained the privilege of paying the interest and principal of their bonds in currency instead of in gold. Still they did not pay anything. The Congress passed another bill empowering the National Government to assume the external debts of the provinces.

When the special order of business had been disposed of Congress adopted a resolution in both Chambers requesting the President to grant a general amnesty to persons implicated in the last revolution. The President refused to entertain the request, which he treated as an invasion of his prerogative. He considered that it would be prejudicial to the discipline of the army and navy to pardon officers who had taken part in revolutionary attempts. The Cabinet, disagreeing with the President, resigned in a body on Jan. 16, and he was unable to find persons to take their places. On Jan. 22 President Peña offered his own resignation to Congress, stating in his farewell message that he had upheld the laws and the Constitution, permitted the free exercise of political rights, and maintained discipline in the army and navy, and that he had kept his promise not to contract new debts or to allow fresh issues of bank notes. His resignation was accepted with only one dissentient vote. Señor Uribe was sworn in as President on Jan. 23, and a ministry was constituted as follows: Interior, Señor Zorilla; Foreign Affairs, Dr. Alcorta; Justice, Señor Bermejo; Finance, Señor Romero; War, Col. Balza. Congress adjourned on Jan. 25. President Uribe signed a decree of amnesty, and the prisoners were released immediately. Political exiles in Uruguay returned to their homes. The new President announced, when Congress met on May 8, that

the policy of the Government would be to restore the financial prestige of the country by economies in the public service and the abolition of the floating debt. The question of the redemption of the paper money would be considered, and steps would be taken for the settlement of the railroad guarantees. The floating debt under the existing law was being converted into consols, of which \$5,670,600 had been issued. The President was opposed to these issues, and expected to be able by means of rigid economy to clear off the floating debt.

The budget for 1896 estimated the expenses at \$85,500,000 in paper and \$20,492,000 in gold. There was an increase in the army and navy estimates to provide for purchases of ships, guns, and other armaments made by commissioners who went to Europe in 1895. The payments on account of the public debt remained the same as in the budget for 1895. To obtain the additional revenue required, the Government proposed to add a surtax of 1 per cent. on all products assessed on the *ad valorem* system, increasing the duty on all imports, and to augment the internal duties on alcohol and tobacco in a much greater ratio.

ARIZONA, a Territory of the United States, organized Feb. 14, 1863; area, 113,020 square miles. The population, according to each decennial census, was 9,658 in 1870; 40,440 in 1880; and 59,620 in 1890. Capital, Phenix.

Government.—The following were the Territorial officers during the year: Governor, Louis C. Hughes, Democrat; Secretary, C. M. Bruce; Treasurer, P. J. Cole; Auditor, C. P. Leitch; Adjutant General, Edward Schwartz; Attorney-General, F. J. Heney; Superintendent of Instruction, F. J. Netherton; Chief Justice of the Supreme Court, Albert C. Baker; Associate Justices, John J. Hawkins, Owen T. Rouse, and James D. Bethune.

Finances.—The Territory has attained a high degree of financial prosperity. In 1891 its treasury showed a deficit of more than \$42,000; in 1892, one of more than \$51,000; and in 1893, one of more than \$34,000. In 1893 Congress authorized the funding of all the municipal indebtedness of the Territory at 5 per cent. Under this authority, maturing parts of the debt will be replaced by a 5-per-cent. loan, where they can not be paid. Through the practice of economy, the treasury held a surplus at the end of the fiscal year 1894 of \$5,832, and in the fiscal year 1895 it was able to reduce the Territorial indebtedness, which on July 1, 1894, aggregated \$874,624, by \$50,485. The total bonded debt is 1894 was \$2,036,000; the floating debt, \$170,523—total, \$2,206,523, of which \$1,331,899 was the aggregate of county and city indebtedness, leaving the net Territorial debt as above.

Valuations.—The assessed valuation of all taxable property in 1894 was \$27,061,974, and in 1895 \$27,518,332, an increase of \$456,358.

Banking.—On Oct. 31, 1894, Arizona had 5 national banks. The total capital was \$400,000; amount of United States bonds held to secure circulation, \$100,500; coin and coin certificates, \$109,453.05; notes issued for circulation, \$244,800—redeemed \$147,350, outstanding \$97,450; and loans and discounts, \$524,304. The Territorial banks numbered 4, and had aggre-

gated capital of \$240,200, resources of \$1,327,176, deposits of \$692,037, and surplus and profits of \$142,900.

Mining.—The output of gold in the fiscal year 1895 was \$4,260,000, an increase of \$2,179,550 over that of 1894, and four times that of 1893; the output of silver was 1,750,000 ounces, representing a decrease of over \$500,000 in value from that of the previous year; the copper output was 49,661,289 pounds, value \$6,207,611; and the lead output, \$350,000 in value. The total value of the bullion exports of the year was \$11,935,111, and the total value of the gold, silver, and copper production of the last nineteen years \$113,739,126.

Agriculture.—The United States Department of Agriculture reported as follows on the principal crops of 1894: Corn, 4,558 acres, 84,779 bushels, value \$84,779; wheat, 11,000 acres, 187,000 bushels, value \$187,000; barley, 9,966 acres, 249,150 bushels, value \$186,863; potatoes, 391 acres, 24,240 bushels, value \$30,303; and hay, 36,219 acres, 63,919 tons, value \$791,028; total value, \$1,279,973.

Live Stock.—In January, 1895, the United States Department of Agriculture estimated the number and value of farm animals in the Territory as follows: Horses 54,278, value \$1,770,815; mules 1,327, value \$39,940; milch cows 14,878, value \$334,735; oxen and other cattle 649,502, value \$6,261,204; sheep 746,546, value \$901,081; and swine 20,904, value \$101,696; total value, \$9,409,491.

Irrigation.—Of 579,000 acres of land under cultivation in 1895, all excepting 15,000 acres in the higher altitudes were irrigated. An additional 165,000 acres are now watered by irrigating canals, but have not been put under cultivation. The gross increase of the farming area in 1895 was 45,000 acres. Canals and storage reservoirs now under construction will reclaim 535,000 acres within the next two years, and other works in contemplation will bring under cultivation over 750,000 acres more. Gov. Hughes recommends the creation of a board of irrigation engineers, consisting of the Territorial irrigation engineer and two United States army engineers, to inspect all irrigation works, in order to guard against disaster resulting from breaking of dams or irrigating reservoirs.

Education.—The total number of children enrolled in the public schools in 1895 was 11,450; number of teachers employed, 314; amount paid in salaries during the year, \$137,291.87; total expenditures for public-school purposes, \$201,357.89; total value of public-school property, \$415,132.02. The last Legislature provided for the establishment and maintenance of public high schools: for the education of the deaf, dumb, and blind; and for military education in the public schools. A new normal-school building is being erected at a cost of \$46,500, and a reform school at Flagstaff will be opened early in 1896. Gov. Hughes recommends that the school lands of the Territory be leased, the revenue therefrom to be appropriated to the maintenance of public schools, claiming that \$75,000 per annum would be realized from this source. The sectarian school enrollment is estimated at 700, and the annual cost of maintaining such schools \$10,000.

Railroads.—On Dec. 31, 1893, the total single-track mileage was 1,161.97; during 1894 4 lines increased their mileage by 193.49 (the largest increase in any State or Territory in that year); making the total mileage on Dec. 31, 1894, 1,355.46. The Santa Fé, Prescott and Phoenix Railroad was extended to Phoenix and was formally opened at the capital on Feb. 28.

Industries.—During 1895 the exports of lumber aggregated 35,000,000 feet; wool, 2,904,130 pounds; sheep, 48,596; hides, 72,500; and agricultural products, in value over \$1,779,000.

Periodicals.—The newspapers and periodicals number 43, of which 10 are daily and 33 weekly.

Political.—Among the enactments of the last Legislature are a new election law containing stringent provisions concerning crimes and offenses against the elective franchise; an act providing for a Territorial board of insurance commissioners; an act creating the county of Navajo; an act creating a Territorial board of immigration commissioners; an act repealing the act establishing a board of railroad commissioners; an amendatory act making the qualification for holding public office the ability to read and write the English language; an act to create a Territorial board of control for charitable, penal, and reformatory institutions; an act providing a penalty for "salting" mines; an act requiring foreign insurance corporations to give bonds for the security of local policy-holders; an act raising the age of consent from fourteen to eighteen years; and an act to prevent waste of water.

ARKANSAS, a Southern State, admitted to the Union June 15, 1836; area, 53,850 square miles. The population, according to each decennial census since admission, was 97,574 in 1840; 209,897 in 1850; 435,450 in 1860; 484,471 in 1870; 802,525 in 1880; and 1,128,179 in 1890. Capital, Little Rock.

Government.—The following were the State officers during the year: Governor, James P. Clarke, Democrat; Secretary of State, H. B. Armistead; Auditor and Insurance Commissioner, C. B. Mills; Treasurer, Runson Gulley; Attorney-General, E. B. Kinsworthy; Commissioner of State Lands and Timber Agent for the State, J. F. Ritchie; Superintendent of Public Instruction, Junius Jordan; Commissioner of Mines, Manufactures, and Agriculture, W. G. Vincenheller; Chief Justice of the Supreme Court, Henry G. Bunn; Associate Justices, Simon P. Hughes; C. D. Wood, Burrill R. Battle, and James E. Riddick; Chancellors, T. B. Martin, James F. Robinson, and L. Leatherman.

Legislative Session.—The thirtieth biennial session of the General Assembly began on Jan. 14, 1895, and continued until April 10. During the seventy-five days on which the Legislature sat 283 bills were introduced in the Senate and 479 in the House. The message of the incoming Governor was devoted entirely to presenting reasons for revising the State Constitution and suggesting a means by which provision might be made for paying the current interest on the State debt. Among the general measures that became laws are the following:

That all railroads over 5 miles long, propelled by steam or electricity, be not allowed to charge more than 12½ per cent. of the cost of a first-class fare be-

two points in the State per 100 pounds for excess of baggage over 150 pounds.

That all able-bodied persons who do not seek some honest employment to procure a livelihood and such persons who are found begging when employment can be obtained shall be treated as vagrants.

Married women may make executory contracts and execute letters giving power of attorney.

Where either party shall subsequent to marriage have become permanently or incurably insane it shall be cause for divorce.

Failure to enforce law on the part of any municipal officer constitutes nonfeasance in office. Circuit court to have jurisdiction over such cases.

That every mechanic or other person who shall perform work on, or furnish material for, any building or improvement of any kind under contract shall have a lien upon such building or improvement, said lien to have priority over any and all other incumbrances, mortgages, etc., except such liens as are created for the purpose of raising funds to make such erection or improvement.

In cases where heirs do not apply within three years after death of testator, or intestate, it is made lawful for executor or authorized person to publish a call to such legatees or heirs to appear. Otherwise, he deposits such sums in office of probate clerk, subject to order of probate judge.

County courts are empowered to refund existing lawful bonded indebtedness by issuing bonds of their respective counties in lieu of bonds heretofore issued by them under any law of the State.

To create county boards of medical examiners.

To tax national bank notes, United States legal-tender notes, and other notes and certificates of the United States circulating as currency, and for other purposes.

Makes all circulating notes taxable. Holders and owners to list such notes under oath.

To quiet tax titles in certain cases.

To give wall and cistern diggers a lien on land upon which improvement is situated.

To give laborers' lien on output, machinery, tools, etc., of mines and quarries.

To provide for the appointment of boards of trustees of the State charitable institutions.

To reorganize the Board of Commissioners of the Penitentiary.

To make it unlawful for any club to keep intoxicating liquors for the use of members without first procuring a license.

To require assessors and collectors to indicate the race of persons liable to taxation.

To make it a misdemeanor to sell, offer for sale, or have in possession with intent to sell, any article of merchandise stamped "sterling," or "sterling silver," unless 925 of the component parts of its metal are pure silver. If the article is stamped "coin," or "coin silver," 900 shall be considered pure silver.

Finances.—In September Auditor Mills discovered that instead of 1,805 outstanding bonds, the State of Arkansas has only 1,753, which makes a difference of \$230,000 in the State's outstanding indebtedness.

In the last biennial report of the operations of the State Treasurer's office, the bonded indebtedness, including interest to Oct. 1, 1894, is given as \$4,323,022.50. A credit is claimed on bonds held by the United States to the amount of \$392,293.33.

In his message on his retirement from office, Gov. Fishback repeats his special message to the pressing Legislature urging the passage of an act directing that all evidences of debt against the State shall be brought to the Treasurer before a certain date, to be by the State Debt Board examined, registered, and stamped,

and decreeing that all evidences of debt not so presented shall forever be barred from payment. He says that since his message first was issued several bonds have been presented for payment which were found to have been paid already by the State.

The Direct Tax fund was created by the appropriation, by an act of Congress of March 2, 1891, of \$156,272.65 to refund the direct tax paid by Arkansas to the National Government in 1865 and 1866. The account of this fund at the beginning of the year is as follows: Original fund, \$156,272.65; on hand Jan. 1, 1893, \$52,595.69; received May 23, 1893, \$15,170.27; disbursed between Jan. 1, 1893, and Jan. 1, 1895, \$29,828.14; on hand Jan. 1, 1895, \$37,937.82.

The condition of the controversy between the Government of the United States and the State of Arkansas, as indicated by the Governor's message on this subject is as follows: The General Government acquired by purchase in 1838, for the use of various trust funds, \$793,000 face value of Arkansas State bonds, which now, with accrued interest, amount to \$2,671,952.50. For twenty years pressure for payment has been made. In 1889 the State Legislature conferred upon the Governor plenary power to represent the State in a negotiation looking to a final settlement. In 1891 Congress conferred upon the Secretary of the Interior and the Secretary of the Treasury similar power, and these officials appointed a committee to conduct the investigation on the part of the Government. On the receipt of their report to the secretaries, a conference between the secretaries and the Governor followed with a view of reaching a definite basis of settlement. Terms of agreement were decided upon, and a bill ratifying them was submitted to Congress in February. The State Legislature, by a concurrent resolution of both Houses, formally assented to the settlement agreed upon. The State had put in counter-claims to almost the full amount claimed by the Government. The Governor's message says:

We had undisputed credits to the amount of \$358,231.13. To extinguish the large balance, we made an effort to show that the balance was equitably extinguished by claims arising in our favor out of the failure of the General Government to patent to this State all of the lands covered by what is known as the Swamp Land Grant of 1850. This is the principal source of our counter-claim, although we made, and were allowed, considerable credits on account of fractional sixteenth sections and for lands to which we are entitled under what is known as the Saline Land Grant. These two latter items are not large. We were also allowed credit for \$206,000, being 5 per cent. of cash derived by the General Government from sale of public lands in this State, as we were also credited with \$7,000 for use of penitentiary during the late war, as place of confinement for military prisoners. As a result of this settlement the State of Arkansas is to receive all of her bonds and coupons except 160 bonds of \$1,000 each, coupons being cut therefrom up to Jan. 1, 1895, and in return the State is to release and quit claim to the General Government all claims under the Swamp Land Grant or any other.

Banks.—On May 7 the deposits on hand in the national banks in the State amounted to \$2,017,000; the loans and discounts were \$2,181,000; the average reserve fund was 43.37 per cent. During the two years preceding January,

1895, 7 State banks were established, with capital stock amounting to \$300,000.

Railroads.—The total valuation of railroad property in 1894 was \$19,932,353. The increase in the assessments for 1895 aggregates \$1,095,000, the heaviest increase being in the Iron Mountain assessment, which is \$889,000 greater than last year. Next comes the Cotton Belt, whose assessment is increased \$209,000. The mileage is not materially changed since last year, the increase being mainly in side tracks.

In September articles of incorporation of the Arkansas and Choctaw Railroad were filed, the capital stock being \$1,500,000. The road will extend from Ashdown, Little River County, into the Indian Territory, 70 miles.

Red River Improvement.—For the improvement of the Red River in Louisiana and Arkansas \$1,325,000 has been appropriated. The improvement consists of snagging, dredging, and protecting by revetments and levees.

Education.—The common-school fund, amounting to \$321,235.87, was apportioned in August, the number of school children in the State being estimated at 438,711, and the amount apportioned to each child being 73 cents, a balance of \$953.04 remaining in the treasury.

The Legislature appropriated \$10,000 a year for the next two years for the establishment in each county of normal institutes for white teachers, and for such additional ones for colored teachers as may be decided upon by the Superintendent of Public Instruction. For the maintenance of the branch normal college until April, 1897, \$11,400 was appropriated, and for the support of the Industrial University \$48,950, until the same date. The university reports 615 pupils at the close of the school year, who were instructed by 35 teachers.

Charitable Institutions.—The biennial reports of the State asylums to Oct. 1, 1894, show that in the Insane Asylum on that date the number of inmates was 485, of whom 383 were white and 102 colored. In the Deaf Mute Institute 187 pupils were enrolled. The School for the Blind had 135 white and 28 colored pupils, for whose maintenance \$35,292.47 had been paid out during the preceding eighteen months. Among appropriations made by the Legislature in March of this year was \$57,188 for the School for the Blind, \$81,440 for the Deaf Mute Institute, \$17,350 for the Soldiers' Home, and \$187,792 for the conduct of the Insane Asylum, all for a period of two years. To repair the damage to the Insane Asylum by the cyclone of last year an appropriation of \$4,500 was made, and to provide for constructing a sewer from the asylum and from the Deaf Mute Institute, to connect with the sewer for the Penitentiary, \$12,500 was appropriated. For the maintenance of Confederate soldiers not in the Soldiers' Home and entitled to pensions, \$35,000 per annum was voted.

Penitentiary.—The report of the committee to investigate the management of the Penitentiary, made in March, shows that since May, 1893, when the State assumed control of it, the Penitentiary not only has become self-sustaining, but has made a net gain of \$49,336.36. Of the \$31,500 appropriated for its maintenance

during two years by the Legislature of 1893, \$27,844.75 has been returned to the treasury. The general appearance and physical condition of the convicts is much improved. Their number on March 25 was 854, of whom 253 were white, 597 colored, and 4 Indians.

Immigration.—The Commissioner of Mines, Manufactures, and Agriculture reports that the immigration from other States in 1894 was greater than in any preceding year, over 50,000 persons having come into the State. Of public lands, over 70,000 acres were conveyed during the first three months of 1895. The increase of population from 1880 to 1890 was 40 per cent., and the increase in wealth was 102 per cent.

Elements of Wealth.—Arkansas has 18,000,000 acres of timber land, from which \$20,000,000 worth of lumber is cut yearly; 4,650,000 acres of coal land; 7,124,000 acres containing ores of iron, manganese, zinc, copper, bauxite, antimony, galena, and silver; 3,150,000 acres containing other clays, kaolin, gypsum, marble, granite, onyx, and slate; and 12,000,000 acres containing sandstone, limestone, lithographic stone, and novaculite. Immense deposits of valuable aluminium clay also have been found.

Decisions.—Among opinions of public interest delivered by the Supreme Court during the year are the following: That an expert who testifies as such in behalf of the State in a criminal case is not entitled to compensation in addition to the usual fees allowed witnesses in such cases. He can not be compelled to make an examination or preliminary preparation, nor to attend the trial and listen to the testimony that he may be better enabled to give his opinion as an expert. For any service of this kind he may demand extra compensation; but such information as he already possesses that is pertinent to the issue he can be made to give, whether such information is peculiar to his trade or profession or not. That the taking or reserving of the highest legal rate of interest in advance on negotiable paper having twelve months to run is not usurious. That "original packages," in the manufacture of whisky, means the quantity as put up by the manufacturer for sale and shipment by himself, and for handling in the regular course of trade. That permanency or continuity of ostensible marital relationship is necessary to constitute illegal cohabitation.

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE. **American.**—The forty-fourth meeting of the American Association was held in Springfield, Mass., during Aug. 28-Sept. 7, 1895. The officers of the meeting were: President, Edward W. Morley, of Cleveland, Ohio. Vice-presidents of the sections: A, Edgar Frisby, Washington, D. C.; B, W. Le Conte Stevens, Troy, N. Y.; C, William McMurtrie, Brooklyn, N. Y.; D, William Kent, Passaic, N. J.; E, Jedediah Hotchkiss, Staunton, Va.; F, Leiland O. Howard, Washington, D. C.; G, John C. Arthur, Lafayette, Ind.; H, Frank H. Cushing, Washington, D. C.; I, Bernhard E. Fernow, Washington, D. C. Permanent Secretary, Frederick W. Putnam, Cambridge, Mass. General Secretary, James Lewis Howe, Lexington, Va. Secretary of the Council, Charles R. Barnes, Madison, Wis. Secretaries of the sections: A, Asaph Hall, Jr., Ann Arbor, Mich.; B, Ernest Merritt,

Ithaca, N. Y.; C. William P. Mason, Troy, N. Y.; D. Henry S. Jacoby, Ithaca, N. Y.; E. J. Perrin Smith, Palo Alto, Cal.; F. Charles W. Hargett, Syracuse, N. Y.; G. Benjamin T. Galloway, Washington, D. C.; H. Stewart Culin, Philadelphia, Pa.; and I. William R. Lazenby, Columbus, Ohio. Treasurer, Robert S. Woodward, New York.

Opening Proceedings.—The usual regular preliminary meeting of the council with which the association begins its sessions was held in The Worthy, which was the headquarters of the association, on Aug. 28, at noon. At this session

EDWARD WILLIAMS MORLEY.

the final details pertaining to the arrangements of the meeting were settled, and the reports of the local committees acted on. Also the names of 101 applicants for membership were favorably considered. At a meeting held on Jan. 29, 1895, 13 names had been already acted on. The general session, with which the public meetings began, was held in Association Hall, of the Young Men's Christian Association, on Aug. 29. The meeting was called to order by Secretary Putnam, who read a letter of regret from the retiring president, Dr. Brinton, announcing his detention in Europe owing to the illness of his wife. Prof. William H. Brewer, the senior vice-president, was then called to the chair, and in a few brief complimentary remarks, in which a reference was made to his magnificent work on the determination of the atomic weight of oxygen, introduced the new president, Edward Williams Morley. Prof. Morley expressed his thanks to the association for the honor that they had conferred upon him, and presented the Rev. Bradley Gillman, of Springfield, who made the prayer. An address of welcome by ex-Lieut.-Gov. William N. Halle, as chairman of the local committee of arrangements, followed, in the course of which he said:

In the contemplation and discussion of these scientific problems which will engross your attention no more suitable place could be found than our Connecticut river valley, with its historical associations,

its environment of many institutions of learning, and its great variety of industries. That your convention will be a success we trust and believe confidently. That its result will have a beneficial effect upon this community we know in advance. This is an age which is demanding the fullest exposition and explanation of the wonderful phenomena hitherto so entirely hidden in obscurity that science is bringing to light. What a vast amount an all-wise Providence has in store for us, which will in due time be made plain to humanity! and it is the privilege of this association, which embraces in its members so many who have achieved marked success in the realm of science, to greatly advance the cause of scientific research and knowledge.

In behalf of Springfield, its mayor, the Hon. Charles L. Long, then welcomed the association to the city. After reference to the meeting held there in 1859 under the presidency of Stephen Alexander, and of the progress in science since that time, he closed with the following:

I am greatly honored in being the representative of such a city, and as its representative in extending to you a cordial welcome to our borders, to an association with our people, to an examination of our institutions, and to such entertainment as we may be able to provide for you; and I assure you that by your presence our citizens appreciate that they are greatly honored by reason of your high standing as individuals, your professional attainments, and the reputation of your association, whose illustrious work in the past will be, I am sure, excelled by the results which will crown its labors in the future.

President Morley then thanked the speakers for their words of welcome and recalled the fact that of the members elected in Springfield in 1859 only three survive, namely, Prof. Simon Newcomb, Prof. Henry A. Ward, and Dr. Samuel H. Scudder. He also said, "This section is the home of the highest literary life of the country, and no State has more intellectual life than Massachusetts."

Miscellaneous business of the association was then taken up, after which the association adjourned to meet in sections.

Address of the Retiring President.—The association met in the Court Street Theater on the evening of Aug. 29 to hear the retiring address of President Daniel G. Brinton. Owing to President Brinton's absence, the address was read by the general secretary. Its subject was "The Aims of Anthropology." He said:

My endeavor will be to point out both the immediate and remote aims of the science of anthropology, and to illustrate by some examples the bearings they have on the thoughts and acts of civilized communities and intelligent individuals. . . . I use the term anthropology in the sense in which it has been adopted by this association—that is, to include the study of the whole of man, his psychical as well as his physical nature, and the products of all his activities, whether in the past or in the present. You will readily understand from this the magnitude of the material which anthropology includes within its domain. First, it investigates the physical life of man in all its stages and in every direction. While he is still folded in the womb it watches his embryonic progress through those lower forms which seem the reminiscences of far-off stages of the evolution of the species, until the child is born into the world, endowed with the heritage transmitted from innumerable ancestors and already rich in personal experiences from its prenatal life. These combined decide the individual's race and strain, and potentially incline, if they do not absolutely coerce, his tastes and ambi-

tions, his fears and hopes, his failure or success. . . . On the differences thus brought about, and later nourished by the environment, biology, as applied to the human species is based; and on them as expressed in aggregates, ethnography, the separation of the species into its subspecies and smaller groups, is founded.

Concerning archaeology, he said:

There is another vast field of study wholly apart from this and even more fruitful in revelations. It illustrates man's mental or psychical nature, his passions and instincts, his emotions and thoughts, his powers of rationalization, volition, and expression. These are preserved and displayed subjectively in his governments and religions, his laws and his languages, his words and his writings; and, objectively, in his manufactures and structures, in the environment which he himself creates—in other words, in all that which we call the arts, be they "hooked to some useful end" or designed to give pleasure only.

He then discussed in turn prehistoric archaeology, folklore, vital statistics, ethnology (concerning the latter he defined its mission to be the definition of "the universal in humanity" as distinguished from all those traits which are the products of fluctuating environment), characterology, and applied anthropology in their various relations to anthropology. In conclusion he said:

It seems clear, therefore, that the teachings of anthropology, whether theoretical or practical, lead us back to the individual as the point of departure and also the goal. The state was made for him, not he for the state; any improvement in the group must start by the improvement of its individual members. This may seem a truism, but how constantly is it overlooked in the most modern legislation and schemes of social amelioration! How many even of such a learned audience as this have carefully considered in what respects the individual man has improved since the beginning of historic time? Is he taller, stronger, more beautiful? Are his senses more acute, his love purer, his memory more retentive, his will firmer, his reason stronger? Can you answer me these questions correctly? I doubt it much. Yet, if you can not, what right have you to say that there is any improvement at all? Ignorant of his past, ignorant of his real needs, ignorant of himself, man has blundered and stumbled up the thorny path of progress for tens of thousands of years. Mighty states, millions of individuals, have been hurled to destruction in the perilous ascent, mistaking the way, pursuing false paths, following blind guides. Now anthropology steps in, the new science of man, offering the knowledge of what he has been and is, the young but wise teacher, revealing the future by the unwavering light of the past, offering itself as man's trusty mentor and friend, ready to conduct him by sure steps upward and onward to the highest summit which his nature is capable of attaining; and who dares set a limit to that? This is the final aim of anthropology, the lofty ambition which the student of this science deliberately sets before himself. Who will point to a worthier or nobler one?

Proceedings of the Sections.—The association is divided into 9 sections, each of which is presided over by an officer having the rank of vice-president of the association. Subsequent to the opening proceedings, each section meets by itself and effects its organization by electing a fellow to represent it in the council, a sectional committee of 3 fellows, a fellow or member to the nominating committee, and a committee of 3 members or fellows to nominate officers of the section for the next meeting. As soon as this organization is effected the secretary

of the section reports to the general secretary, who then provides him with a list of papers that, having been considered suitable by the council, may be read and discussed before the section. A press secretary, whose duties are to receive abstracts of the papers read and to give them to reporters, is an official that has come into service since 1893.

Sections.—*A. Mathematics and Astronomy.*—At the meeting held in Brooklyn in 1894 it was decided by the council that the association should gather in some place in California, not far from San Francisco, provided that satisfactory arrangements could be made for transportation. Notwithstanding the efforts made by Prof. Joseph Le Conte, a past president, who had so strongly urged a meeting on the Pacific coast, it proved impossible to make the desired arrangements, and an invitation from Springfield was therefore accepted by the council at a special meeting held on Jan. 26, 1895. Among the officers chosen as vice-presidents were two from California, and when it was decided to hold the meeting in Springfield they found it impossible to attend, and in consequence resigned. The first of these was Edward S. Holden, Director of the Lick Observatory, and to fill his place, Edgar Frisby, of the United States Naval Observatory in Washington, D. C., was nominated by the council and confirmed by the association. Eliakim H. Moore, of Chicago, who had been chosen secretary of the section, likewise resigned, and to his place Asaph Hall, Jr., was chosen.

The following-named papers were read and discussed before the section:

"Development of Some Useful Quaternion Expressions, with Applications to Geometry of Three and Four Dimensions," by James B. Shaw; "The Constant of Aberration," by Charles L. Doolittle; "On the Constant of Nutation," by Seth C. Chandler; "Progress of the Zeno Work at the Naval Observatory, Washington, D. C.," by Aaron N. Skinner; "On the Distribution and the Secular Variation of Terrestrial Magnetism," by Louis A. Bauer; "Sunspots and Magnetic Storms," by Major A. Vonder; "The Spectrum of β Lyra," by Edwin B. Frost; "Notes on Square Numbers whose Sum is either a Square or the Sum of Other Squares," by Artemus Martin; "Some Results for Stellar Parallax from Meridian Transit Observations at the Washburn Observatory," by Albert S. Flint; "Making Astronomy Popular," by Miss Mary Procter; "A Convenient Formula for computing Times of Moon Rising" and "On a Slide Scale for Computing Erosion," by Edgar Frisby; "Chronology and Ancient Eclipses," by Samuel W. Balch; and "Period of R. Comae," by Henry M. Parkhurst.

B. Physics.—The presiding officer of this section was Prof. W. Le Conte Stevens, who fills the chair of physics in the Rensselaer Polytechnic Institute in Troy, N. Y. He chose as the title of his address "Recent Progress in Optics," and discussed "light-waves as standards of length" at first. The new method is operated by interference of beams of light reflected and transmitted by a plate of plane parallel optical glass, and then reflected back by two mirrors appropriately placed; fringes are caught in an observing telescope. The subject of "luminescence" was then taken up, and from the fact that instantaneous luminescence, which is fluorescence, is accompanied by chemical action on a minute

scale, it is probable that all luminescence is therefore jointly physical and chemical. Photography, like luminescence, is a manifestation of the transformation of energy, most frequently of initial short wave length. The production of color by photography is nothing new, but such colors can not be made permanent. Turning to "stationary light-waves," he said, "Two quite different methods are to be considered in tracing the recent development of this interesting application of optical principles." He referred to the work of Becquerel and the more recent studies of Lippman. The latter he considered at some length.

Of the applications of the spectroscope that have resulted in recent additions to our knowledge, it is possible only to make mention of a few. Rowland has been investigating the spectra of all the chemical elements, photographing them in connection with the normal solar spectrum, and reducing them to his table of standards, which is now accepted. Through the spectroscope chiefly has been established the discovery of the atmospheric element, argon; its remarkable property of green fluorescence when the electric spark is passed through it in presence of benzene; and its association in meteoric iron and various minerals with helium, now proved to be a terrestrial as well as a solar element. By photographing the spectrum of Saturn's rings and noting the relative displacement of the different parts of a spectral line, Keeler has obtained a beautiful direct proof of the meteoric constitution of these rings. A new substance with double rotatory power, like quartz, has been discovered by Wyruboff, the neutral anhydrous tartrate of rubidium, which is unique in that its rotatory power in the crystalline state becomes reversed in solution.

He closed with a discussion of certain developments in physiological optics. One discovery is that the rotating color disk has been applied by Ogden N. Rood to the determination of luminosity independently of color by taking advantage of the flickering appearance on a rotating disk upon which two parts have different reflecting powers. An extreme case of this is that of a white sector upon a black disk. At a certain critical speed the retinal shock due to momentary impression by white light becomes analyzed into the subjective impression of spectral colors, the duration of the retinal sensation varying with the wave length of the incident light.

Subsequently the following-named papers were read and discussed before the section:

"Expansion of Jenson's Steel, measured by Interferential Method," by Edward W. Morley and William A. Rogers; "Flow of Alternating Current in an Electrical Cable" and "The Most General Relation between Electric and Magnetic Force and their Displacements," by Michael I. Pupin; "The Significance of Color Terms," "On Standard Colors," and "The Analysis of Floral Colors," by J. H. Pillsbury; "On the Comparison in Brightness of differently Colored Lights and the 'Flicker' Photometer," by Frank P. Whittman; "A New Apparatus for studying Color Phenomena," by Ernest K. von Nardroff; "Voice Production, with Photographs of the Vocal Cords in Action" and "Voice Analysis, with Photographic Record," by Floyd S. Muecke and William Hallock; "Note on the Limits of Range of the Human Voice," by W. Le Conte Stevens; "Observations on the Re-

lations of Certain Properties of Line Spectra to the Physical Conditions under which they are produced," by John F. Mohler and W. J. Humphreys; "The Reproduction of Colors by Photography," by Frederick E. Ives; "Color Definitions for the Standard Dictionary," by William Hallock and Reginald Gordon; "Electrolytic Reproduction of Resonators," "A Photographic Method of Comparing the Pitch of Tuning Forks," and "Illustration of Gems, Seals, etc.," by William Hallock; "An Examination of the Statement of Maxwell that all Heat is of the Same Kind," by William A. Rogers; "An Experimental Investigation of the Rotary Field," by Henry D. Carhart; "Phenomena with Electric Waves analogous to those of Light with a Diffraction Grating," by C. D. Child; "The Effect of Age upon the Molecular Structure of Bronze, Glass, and Steel" and "A New Determination of the Relative Lengths of the Yard and Metre," by William A. Rogers; "A New Formulation of the Second Law of Thermodynamics," by Louis A. Bauer; and "The Method of Reciprocal Points in the Graphical Treatment of Alternating Currents," by Frederick Bedell.

The following papers were presented before a joint meeting of the sections of Astronomy, Physics, Economic Science, and Geography on Aug. 30:

"Relations of the Weather Bureau to the Science and Industry of the Country," by Willis L. Moore; "Solar Magnetic Radiation and Weather Forecasts," by Frank H. Bigelow; "Clouds and their Nomenclature," by Cleveland Abbe; "Cloud Photography" (with lantern illustrations), by Alfred J. Henry; and "California Electrical Storms," by John D. Parker.

C. Chemistry.—This section was presided over by Dr. William McMurtrie, of Brooklyn, who discussed "The Relation of the Industries to the Advancement of Chemical Science" in his vice-presidential address. At the outset he mentioned the circumstances which led to the absorption of chlorine by organic bodies, concerning which Dumas declared that "it is not generally known that the theory of substitution owes its source to a *soirée* in the Tuileries." Dumas had been called upon by his father-in-law, Alexander Brogniart, who was director of the Sèvres porcelain works and in a measure a member of the royal household, to examine into the cause of the irritating vapors from candles burned in the ballroom, a demand to which Dumas readily acceded, because he had already done some work upon the examination of wax that could not be bleached and was therefore unmerchable. It was therefore from the application of chemistry to the industries that this fact was established.

It seems to make little difference to which branch of chemical work we turn for illustrations of these ideas. The losses suffered by Italy and France by the diseases of the silkworm, the deterioration of the wines, and the diseases of animals made demands upon the genius of Pasteur, and through his brilliant work and magnificent results attention has been directed to the field of bacteriology and fermentation, and almost a new science has been built upon it. The development of the coal-tar industries and the growth of the use of electricity in the production of chemical products was mentioned. In conclusion he said:

It would be impossible in this discussion to cover more than a few of the manifold ways in which the science of chemistry has been advanced by the industries, their wants, and their wastes. The former

have led to the establishment of the great systems of technical schools, the State and national experiment stations, the various official boards and commissions for the study of those questions which immediately affect the general welfare, and from each and all of these sources come reports of advances which are most gratifying. The latter—that is, the industrial wastes—gave us new elements and new compounds, and so furnished the material for the establishment of new laws. The soap-boiler's lye gave iodine, the wastes of the salt gardens gave bromine, the mother liquors from the springs gave cesium and rubidium, the acid chambers selenium and thallium, and the mines and metallurgical works gave gallium and germanium. Whether we consider this side of the subject of the advancement of our science from one direction or another, we shall find ample encouragement for combination of forces and for closer union of professional and technical workers in our general field of activity.

The following-named papers were then read and discussed before the section:

"Foreign Laboratory Notes," by William P. Mason; "The Coloring Matter of Natural Waters: Its Source, Composition, and Quantitative Measurement," by Ellen H. Richards and Joseph W. Ellms; "Helium and Argon," by Henry N. Stokes; "Recent Views on the Periodic System," by Frank P. Venable; "Double Salts and Allied Compounds," by Charles H. Herty; "On the Volumetric Composition of Water," by Edward W. Morley; "Camphore Acid," by William A. Noyes; "Constitution of the 1:4 Diketones," by Alexander Smith; "The Constitution of Tetraic Acid," by Paul C. Freer; "Periodides," "Periodides of Pyridine," "A Few Pyridine Alkyl Normal Iodides," and "Some Inquiries respecting Inherent Limitations in the Accuracy of Analytical Work in General," by Albert B. Prescott; "Dipyridine Trimethylene Dibromide," by R. F. Flinterman and A. B. Prescott; "Some New Color Reactions," and "A Second Modification of Picrylmalonic Ester," by Charles L. Jackson; "The Teaching of Organic Preparations: The Time, Scope, Methods, and Previous Preparation," by Paul C. Freer (with discussion of the above, by William A. Noyes, Thomas H. Norton, A. A. Noyes, and Charles L. Jackson); "Remarks on International Standards of Analysis of Steel," by Charles B. Dudley; "Ammonium Phosphomolybdate and the Reducing Action of Zinc in the Reductor," by Andrew A. Blair, and John E. Whitfield; "Provisional Schedule of Admissible Limits of Accuracy in Certain Metallurgical Analyses," by Edward D. Campbell; "Accuracy in Metallurgical Analysis," by Frederick P. Dewey; "On the Use of Thioacetic Acid as a Laboratory Reagent" and "The Phosphorus contained in Phospho-cereal," by Thomas H. Norton; "On the Sulphides of Arsenic formed in Analytical Work," by Paul C. Freer; "Chemistry as a Liberal Education," by Peter T. Austen; "Journal Reviews," by William A. Noyes; "Remarks on a Specific Form of Cell Metabolism," by Ernest E. Smith; "Products of Pathogenic Bacteria," by E. A. de Schweinitz; "Some Points connected with the Chemistry and Physics of Metabolism," and "Chemistry of Foods and Nutrition," by W. O. Atwater; "Recent Progress in Physical Analysis of Soils," by Milton Whitney; "Calcium Carbide," by P. de Chalmot; "The Major Premise in Physical Chemistry," by Robert B. Warder; "Contributions to the Knowledge of the Laws of the Velocity of Polymolecular Reactions," by A. A. Noyes; "Discussion on Important Phases of Didactic Chemistry" and "Laboratory Construction and Equipment," by Thomas H. Norton; "Bibliography as a Feature of the Chemical Curriculum," by H. Carrington Bolton; "Instruction in General Chemistry," by Charles L. Jackson; "Relative Order of Theory and Description in the Teaching of General Chemistry," by James L. Howe; "Quantitative Exercises in General Chemistry" and "Record of Progress in Agricultural Chemistry," by Henry W. Wiley.

D. Mechanical Science and Engineering.—

The presiding officer of this section was William Kent, of Passaic, N. J., who delivered a vice-presidential address on "The Relation of Engineering to Economics." He said: The engineer is the tool builder. His best work is the building of an engine which manufactures power, makes industry most productive, and manufactures commodities which are the elements of wealth. The great forces of Nature which the engineer utilizes for the production of wealth are the forces of wind and running water, and the stored energy of fuel in the forests, peat bogs, coal mines, and gas and oil wells. By far the greatest of these forms of stored energy is that of coal. A man's labor by means of coal and a steam engine can be multiplied 650 times. It is generally acknowledged that the steam engine and labor-saving machinery in general are the chief agents of the civilization of the latter half of the nineteenth century, and that they have increased the productiveness of man's labor, increased his wages, shortened his hours of toil, cheapened his food and clothing, and given the average man comforts and luxuries which a century ago not even kings would have commanded. To illustrate the influence of engineering on production and distribution, the completion of the trans-Siberian railroad and the extension of railroads in India and in the Argentine Republic will probably before long make Europe independent of the grain crop of America. The Erie Canal made New York a metropolis. Who can estimate the economic value to the United States of that great feat of engineering, the building of the first railroad across the continent? Mr. Kent contended that the statement that the poor are growing poorer is a falsehood. Statistics prove that the wages of labor have tended ever since the extensive use of the steam engine, say, about 1850, to increase, and the cost of living to decrease. Engineering and mechanical skill also add to the comforts of the people. In concluding, he referred to the relations of labor and capital, and said: "There will be no sudden upheaval. The present relations of capital and labor will not be changed, except as by gradual and necessary evolution, due to engineering more largely than to any other one cause, capital and labor becoming merged by the laborers becoming capitalists. This will be the crowning triumph of engineering, by which the increase of wealth is caused, which enables the laborer to become a capitalist."

The following-named papers were then read and discussed:

"The Economics of Engineering Public Works," by H. N. Ogden; "Mathematical Theory of the Windmill," by De Vries Wood; "Experiments on the Flow of Steam, and Comparison of the Results with Napier's Formula" by John J. Flather; "On Partially Continuous Drawbridge Trusses, with a Method of deducing Formulas for the Reactions," by Mansfield Merriman; "On the Design of Fish-plate Timber Joints," by Harold S. Jacoby; and "The Perfect Screw Problem, illustrated by a Combined Ruling Engine and Comparator in Automatic Operation," by William A. Rogers.

E. Geology and Geography.—Jedediah Hotchkiss, of Staunton, Va., was the presiding officer of this section, and the subject of his address

was "The Geological Survey of Virginia, 1835-'41: Its History and Influence in the Advancement of Geologic Science." Owing to the absence of Mr. Hitchcock at the time appointed for the delivery of his address no abstract of it has appeared. Essentially, it was an informal talk on the geological survey of Virginia, which was conducted under the direction of Profs. William R. and Henry D. Rogers during 1835-1841. According to the speaker, it was the first important geological survey carried on in the United States. The expense for the entire work of five years was only \$100,000.

The following-named papers were then read and discussed before the section:

"The Relations of Primary and Secondary Structures in Rocks," by Charles R. Van Hise; "The Archean and Cambrian Rocks of the Green Mountain Range in Southern Massachusetts," by Benjamin K. Emerson; "Gotham's Cave; or Fractured Rocks in Northern Vermont," by Charles H. Hitchcock; "Recent Discovery of the Occurrence of Marine Cretaceous Strata on Long Island," by Arthur Hollick; "Geological Canals between the Atlantic and Pacific Oceans" and "Recent Elevation of New England," by John W. Spencer; "Geological Notes on the Lakes of Shoals," by Horace C. Hovey; "Subdivision of the Upper Silurian in Northeast Iowa," by Andrew G. Wilson; "Supplementary Notes on the Metamorphic Series of the Shasta Region of California," by James P. Smith; "View of the Ice Age as Two Epochs, the Glacial and Champlain," by Warren Upham; "Glacial Phenomena between Lake Champlain and Lake George and the Hudson," by George F. Wright; "Whirlpool of Niagara," by George W. Holey; "Distribution of Sharks in the Cretaceous," by Charles R. Eastman; "Terminology proposed for Description of Pelecypoda," by Alpheus Hyatt; "The Equatorial Counter-currents," by William M. Davis; "Interesting Features in the Surface Geology of the Genesee Region," (with lantern illustrations), by Herman L. Fairchild; "Japan," by Gardner G. Hubbard; and "Great Falls of the Mohawk at Cohoes, N. Y." (with lantern illustrations), by William H. C. Fyfe.

F. Zoology.—At the Brooklyn meeting of the association President David S. Jordan, of the Leland Stanford, Jr., University, was chosen to preside over this section, but, subsequent to the abandonment of the place of meeting in California, he resigned. To fill the vacancy, Leland O. Howard, of Washington, was nominated by the council and the selection was confirmed. No vice-presidential address was delivered.

The following-named papers were read and discussed before the section:

"The Evolution of the Insect Mouthpiece" (with lantern illustrations), by John B. Smith; "The Mouthpieces of Insects, with Special Reference to the Diptera and Hemiptera," by Charles L. Marlatt; "On the Olfactory Lobes," by Charles S. Minot; "Notes on Fleas, Mosquitoes, and the Hornflies," by Leland O. Howard; "On the Visceral Anatomy of the Lacertiles" and "The Affinities of the Pythonomorph Reptiles," by Edward D. Cope; "Characters which are useful in raising Larvæ of Spellingidae," by George Dimmock; "Temperature Variations of Cattle observed during Extended Periods of Time, with Reference to the Tuberculosis Test," by Julius Nelson; "On the Girdling of Elm Twigs by the Larvæ of *Orygia coccostigma*, and its Results," by Joseph A. Linner; "Notes upon the Eupaguridae," by Charles W. Harrist; "On a Revision of the North American Crustaceanidae," "Stemmistilus as an Ordinal Type," and "A New Character in the Colobognatha, with Drawings of Siphonotus," by Orator F. Cook;

"A New Wheel for Color Mixing in Tests for Color Vision" and "Some Further Results of Investigation of Areas of Color Vision in the Human Retina," by J. H. Pillsbury; and "A Study of *Panorpa* and *Bit-tacus*," by Ephraim P. Felt.

G. Botany.—This section was presided over by Prof. John C. Arthur, of Lafayette, Ind., who delivered an address before the section, entitled "The Development of Vegetable Physiology." He said: "A half century ago vegetable physiology in the fullness of the modern meaning did not exist. Structural botany was then the dominant phase, and in elementary instruction close attention was paid to the form and arrangement of the organs of flowering plants, with the ulterior object of being able readily to determine the names of the plants of the field. The revivifying spirit in the botanical world emanated from the observations and interpretations of Charles Darwin. Of the development of botany in the curriculum, he said that until the time of Asa Gray it can not be said to have had recognized standing in the American educational system. The department of physiology has received much attention here and there for a long time, yet only very recently has it fallen into place as a systematic part of the general subject. Ecology, which is the name under which 'we are to attempt the orderly arrangement of the facts, observations, and deductions composing the science,' was discussed, and then calli-ology, which includes the various phases of juvenescence, especially the dynamics of the young cell, was considered. Elaborating the discussion of physiology, he said:

There are many ways in which plants show similar physiological processes to those of animals; and plants, being simpler in organization, their study may promote a knowledge of animal physiology. The greatest similarity between the two kingdoms lies in nutrition, respiration, and reproduction. The greatest divergence is to be found in the manifestation of irritability. Those fundamental processes upon which being and continued existence depend are much the same throughout animate Nature, but the processes by which the organism communicates with the world outside of itself, and through which it is enabled to adjust itself to environmental conditions, the processes which in their highest development are known as sensations, have attained great differentiation, running along essentially different lines of development. The prevalent view that plants occupy an intermediate position between the mineral and the animal kingdoms is not true in any important respect. Neither is it true that the faculties of animals, especially of the lower animals, are foreshadowed in plants.

Of botany in this country, he said: "This is the country of all others where its practical and educational importance is likely to be most fully recognized, and where the best-equipped and most independent laboratories can most readily be established." In conclusion, he advocated better equipped laboratories, and claimed "that the next great botanical wave that sweeps over America will be a physiological one." Subsequently the following-named papers were read and discussed before the section:

"A Leaf Rot of Cabbage," by H. L. Russell; "Root Fungus of Maize" and "Enantiomorphism in Plants," by George Maeloskie; "On the Analysis of Floral Colors," by J. H. Pillsbury; "A Summary of a Revision of the Genus *Dicranum*," by Charles R. Barnes and Rodney H. True; "Experiments in pollinating

and hybridizing the Orange," by H. J. Webber; "History and Present Status of Orange Culture in Florida," by Charles P. Hart; "An *Eumecurus* upon *Alnus* leaves," by Mrs. Flora W. Patterson; "*Ochalaria Virginica* L.: A Morphological and Anatomical Study," by Theodore Holm; "Botany of Yakutat Bay, Alaska" and "Poisoning by Broad-leaved Laurel, *Kalmia latifolia*," by Frederick V. Coville; "The Physiology of *Juncus Viteruatum* L." and "The Transmission of Stimuli Effects in *Mimosa pudica* L." by Daniel T. MacDougal; "Personal Nomenclature in the Myxomycetes," by Orator F. Cook; "A New Californian Liverwort," by Douglas H. Campbell; "Variation after Birth," by Liberty H. Bailey; "Rejuvenation and Heredity," by Charles S. Minot; "The Distinction between Animals and Plants," by John C. Arthur; "Fungous Gardens in the Nests of an Ant (*Atta Tardigrada*, Buckl.) near Washington, D. C.," by Walter T. Swingle; "The Number of Spare Mother Cells in the Sporangia of Fungi," by Willis L. Jepson; "The Constancy of the Bacterial Flora of Fore Milk," by Henry L. Bolley; "The Watermelon Wilt and other Wilt Diseases due to *Fusarium*" and "The Southern Tomato Blight," by Erwin F. Smith; "Observations on the Development of *Uncinula spiralis*," by Benjamin T. Galloway; "The Effect of Sudden Changes of Turgor and of Temperature on Growth," by Rodney H. True; "Recording Apparatus for the Study of Transpiration of Plants," by Albert F. Woods; "Pressure, Normal Work, and Surplus Energy in Growing Plants," by George M. Holferty; and "Notes on the Ninth Edition of the London Catalogue of British Plants," by Nathaniel L. Britton.

H. Anthropology.—Over this section Frank Hamilton Cushing, of the Bureau of Ethnology, was called to preside. His address was more specific than general, for he discussed "The Arrow, with Experiment Illustrations." One of the most ancient of the things man has made is the arrow, and the arrow was perfected in well-nigh all its parts long before the simplest bow came into existence. Mr. Cushing told how he had made arrows, and then said:

I have told this history as it occurred: first, to instance the manner in which I discovered flint flaking, by chancing ignorantly to follow precisely the course primitive man must necessarily have followed. And secondly, to convey to you the lesson that I could learn more by strenuously experiencing with savage things and arts than others or I could have learned by actually and merely seeing and questioning savages themselves about such things and arts. And thirdly, this experience has taught me, that paleolithic man, of the French caves, at least—that man who is said to have known no other art of working stone than by rudely breaking it into shape by blows of other stones—could not have existed in such primary status of art for more than a few seasons, at most.

Then, following the development of the arrow, and, describing the method of its production for various uses, he continued:

From breaking of shells, stones, and bones, and the much cutting of his fingers thereby, primal man must have learned to do all kinds of cutting, scraping, and scratching with the sharp fragments. For long he probably used these fragments unmounted, grasping them with wads of seaweed or grass, as I have grasped a stone, with a fold or two of buckskin, in making with it all the shaft polishers and other like tools. But by lodging such blades in wood, or often wedging sharp things into the end of his spear-form digging stick, he must have learned in time that the stick, so long as thus armed, dug better and cut his contestants better. In time the primitive men began to fit the shafts with straps or their fingers with sling-ropes to further the flight. From the soreness

that came of much or constant use of such first appliances the loops, bone or rings for the fingers, more rigid and joined together; and these, in turn, palms of rawhide for the throwing hands, or of wood hollowed straightly and fitted with holes at the sides for the thumb and great finger, and with a groove underneath, extending to the rear end, at which was a notch or a hole for the forefinger when stretched along the groove and thrust up through the hole. Thus he continued until the arrow was completed and fitted for use in combination with the bow.

The following-named papers were then read and discussed before the section:

"A Study in Anthro-geography as a Branch of Sociological Investigation," by William Z. Ripley; "The Algonquian Appellatives of the Shuman Tribes of Virginia" and "The Mystery of the Name Pamunkey," by William W. Tooker; "Indian Songs and Music" and "The Sacred Pole of the Omaha Tribe," by Alice C. Fletcher; "The Year of the Pleistocene of Prehistoric Starline" and "The Influence of Prehistoric Pygmy Races on Early Calendars and Cults, with Notes on Dwarf Survivals," by R. G. Haliburton; "Account of the Discovery of a Chipped Chert Implement in Undisturbed Glacial Gravel near Steubenville, Ohio," by Frederick G. Wright; "A Study in Child Life," by Laura O. Talbot; "The Indians of Southern California," by Franz Boas; "The Comagone Gods of the Iroquois," by J. W. B. Hewitt; "Word Formation in the Kutenay Language" and "Kutenay Indian Personal Names," by Alexander F. Chamberlain; "A Vigil of the Gods," by Washington Matthews; "Some Arabic Survivals in the Language and Folk Usage of the Rio Grande Valley," by John G. Bourke; "The Spider Goddess and the Demon Snare" and "The Dynasty of the Arrow," by Frank H. Cushing; "The Origin of Playing Cards," "The Origin of Money in China," and "Mustach Sticks of the Ainu," by Stewart Culin; "An Ojibwa Transformation Tale," by Harlan I. Smith; "Old Mahawk Words" and "An Iroquois Conscience," by William M. Beauchamp; "Mental Measurements in Anthropology," by J. McKeen Cattell; "Some Symbolic Carvings from the Ancient Mounds of Ohio," by Frederick W. Putnam and C. C. Willoughby; "Notes on the Bushmen of Transvaal," by George Leith; "Village Life among the Cliff Dwellers," "The Different Races described by Early Discoverers and Explorers," and "The Palaeolithic Cult, its Characteristic Variations and Tokens," by Stephen D. Peet; "A Melange of Micmac Notes," by Stansbury Hager; "Grammatical Form and the Verb Concept in Iroquoian Speech," by J. W. B. Hewitt; "Anthropometrical, Psycho-neural, and Hypnotic Measurements," by Arthur Macdonald; "The Education of Blind-deaf Mutes," by John Dutton Wright.

I. Economic Science and Statistics.—The presiding officer of this section was Bernhard E. Fernow, of the Department of Agriculture in Washington. He discussed "The Providential Function of Government in Relation to Natural Resources" in his address. The first part was taken up with the discussion of theories of government and of the right of interference with individual control of natural resources. He expressed his doubt as to whether there is yet such a thing as economic science, and thought that the section should be called the section of social science. After showing reason for holding that the Government has the right to prevent waste of natural resources, he classified these as follows: First, resources inexhaustible; second, resources exhaustible and nonrestorable; third, resources restorable, but liable to deterioration; fourth, resources restorable, and apt to yield increased activity. Of the first class there are

hardly any. To the second class belong mines, and to the third timber, water power, and fisheries. To the fourth class belong most of the resources which are the product of human labor, industry, and ingenuity; the accumulated wealth, the accumulated educational fund, and other conditions of civilization, the people themselves capable of performing labor.

Most of his address was devoted to the fourth class, with special reference to his own specialty of forestry. He deplored the attempt to get the largest profit from labor, which is the only incentive of private enterprise, and is bound to lead to unconservative management, especially where the maintenance of favorable forest conditions from protective considerations is necessary, for here, again, the need of leaving valuable material for the time being, the need of curtailing present revenue for the sake of the future and for the sake of other people's interest, can hardly be expected to be appreciated by the private individual.

In closing, he expressed the hope "that the students of political economy associated with this section will see that this branch of their science, the economy of natural resources, so important and yet so much neglected, requires on their part a fuller and more careful consideration."

Subsequently the following-named papers were read and discussed before the section:

"Manual Training in Horticulture for Our Country Schools," by William R. Lazenby; "Equality of Opportunity: How can we secure it?" by J. L. Cowles; "On Sanctions," by William L. O'Neill; "Growth of Great Cities," by Elmer L. Corthell; "Taxation in the United States," by Edward Atkinson; "A System of Co-metallism," by J. W. Sylvester; "An International Coinage," by Henry Farquhar; "The Law of Chances, Illustrated in Railway Accidents," by Thomas C. Mendonhall; and "A Cottage Settlement in Spain," by Mary J. Eastman.

Popular Features of the Proceedings.—

These began with an evening reception from 8 to 11 P. M. on Aug. 28, by the president of the City Library Association to members of the association at the Art Museum for the purpose of inspecting the George Walter Vincent Smith Art Collection. Subsequent to the delivery of the presidential address, on the evening of Aug. 29, the usual reception by the Ladies' Reception Committee was given in City Hall. On Aug. 30, the Art Museum was open to members of the association in the afternoon. In the evening a public lecture on the "Geographical Development of the Connecticut Valley" (with lantern illustrations), complimentary to the citizens of Springfield, was given by Prof. William M. Davis, of Harvard University. As usual, Saturday (Aug. 31) was devoted to an excursion and a trip to Amherst, Northampton, and Mount Holyoke College was arranged. Such members as desired to visit Mount Holyoke College, took carriages at Holyoke. The main excursion train went to Amherst, where Amherst College was visited, also the new science laboratory and the collections of mineralogy, geology, and zoölogy, or the Massachusetts Agricultural College with its insectary, where the various stages and development of insects and their manner of living were studied. From Amherst a visit was made to Northampton, to inspect Smith College. Besides a union meet-

ing on Sunday evening, Sept. 1, at which addresses were given by Prof. William N. Rice, of Wesleyan University, Middletown, Conn., Prof. George Macloskie, of Princeton, N. J., President James Woodrow, of South Carolina College, and Miss Alice C. Fletcher, of Cambridge, Mass., sermons appropriate to the occasion were delivered at the morning service of several of the churches. Among these was one on "Science and Life," by Rev. Philip S. Moxom; one on "The Scientific Aspects of the Christian Evidences," by Prof. G. Frederick Wright; one on "The Services of Sciences," by Rev. Bradley Gilman; and one on "The Alternative—Christianity or Agnosticism," by the Rev. William N. Rice.

On the evening of Sept. 3 a second public lecture, complimentary to the citizens of Springfield, on "The Wild Flowers of the Connecticut Valley" (with colored lantern illustrations), was given by Mr. Cornelius Van Brunt, of New York. Also a public lecture on the "Illustrative Method of teaching Geography and Zoölogy at the American Museum of Natural History in New York City" (with lantern illustrations) was given on Sept. 4 by Prof. Albert S. Bickmore, of New York city.

Affiliated Organizations.—Various other scientific societies, taking advantage of the gathering of so many of their members at the meeting of the American Association, have in recent years adopted the practice of holding meetings at the same place and contemporaneous with the American Association, but at such hours as not to interfere with the regular sessions of the larger body. Of these, the Society for Promotion of Agricultural Science met on Aug. 26 and 27. Its president was William Saunders, of Ottawa, Canada, and its secretary was William Frear, of the State College, Center County, Pa. The Botanical Society of America held meetings on Aug. 27 and 28 under the presidency of Charles E. Bessey, of Lincoln, Neb., and with Charles R. Barnes, of Madison, Wis., as secretary. Likewise, on Aug. 27 and 28 the American Chemical Society met, with Edgar F. Smith, of the University of Pennsylvania, Philadelphia, Pa., as president, and Albert C. Hale, of Brooklyn, N. Y., as secretary. On the same dates the Association of Economic Entomologists convened, with John B. Smith, of New Brunswick, N. J., as president, and Charles L. Marlatt, of Washington, D. C., as secretary. The Geological Society of America held its seventh summer meeting on Aug. 27 and 28, with Nathaniel S. Shaler, of Cambridge, Mass., as president, and Herman L. Fairchild, of Rochester, N. Y., as secretary. The American Mathematical Society held meetings on Aug. 27 and 28. The president was Dr. George W. Hill, of West Nyack, N. J., and its secretary was Thomas S. Fiske, of New York city. The Society for Promoting Engineering Education met on Sept. 2, 3, and 4, with George F. Swain, of Boston, Mass., as president, and John B. Johnson, of St. Louis, Mo., as secretary. The American Forestry Association met on Sept. 3. Its president was the Hon. J. Sterling Morton, and its secretary was Frank H. Newell, both of Washington, D. C. As usual during the meeting, regular sessions of the Botanical Club, with David F. Day, of Buffalo, N. Y., as president and Henry

L. Bolley, of Fargo, N. D., as secretary, and the Entomological Club, with the Rev. C. J. S. Bethune, of Port Hope, Ontario, as president, and Charles L. Marlatt, of Washington, D. C., as secretary, were held.

Final Sessions.—The final session of the association was held on the evening of Sept. 4, when the action of the council at its meeting earlier in the day was submitted for ratification. Among the measures proposed and accepted was the recommendation that the association meet on Monday in lieu of Wednesday. This caused much discussion, but was finally confirmed. The amendments to the constitution that prevailed were the allowing of incorporated societies to become members; the changing of the name of Section I from "economic science and statistics" to "social and economic science," the alternative title "sociology" being voted down; the requiring that the treasurer give bonds recommended by a fidelity company, at the expense of the association. It was decided not to form a new section for geography, and the offered amendment making it compulsory for local committees to include all local members and fellows of the association was defeated. A grant of \$100 was given to Prof. William A. Rogers, of Colby University, for continuing his experiments in light measurement. Secretary Putnam reported that 367 members were in attendance. There were 185 new members elected and 58 advanced to the grade of fellows. Four had died during the year. There had been 3 public lectures and 207 papers presented during the meeting.

The Next Meeting.—The association decided to meet in Buffalo in 1896, and the time appointed for gathering is the fourth Monday in August. The following officers were chosen: President, Edward D. Cope, Philadelphia, Pa. Vice-presidents of sections: A, William E. Story, Worcester, Mass.; B, Carl Leo Mees, Terre Haute, Ind.; C, William A. Noyes, Terre Haute, Ind.; D, Frank O. Marvin, Lawrence, Kan.; E, Benjamin K. Emerson, Amherst, Mass.; F, Theodore N. Gill, Washington, D. C.; G, Nathaniel L. Britton, New York city; H, Alice C. Fletcher, Washington, D. C.; and I, William R. Lazenby, of Columbus, Ohio. Permanent Secretary, Frederick W. Putnam, Cambridge, Mass. General Secretary, Charles R. Barnes, Madison, Wis. Secretary of the Council, Asaph Hall, Jr., Ann Arbor, Mich. Secretaries of the sections: A, Edwin B. Frost, Hanover, N. H.; B, Frank P. Whitman, Cleveland, Ohio; C, Frank P. Venable, Chapel Hill, N. C.; D, John Galbraith, Toronto, Canada; E, A. C. Gill, Ithaca, N. Y.; F, D. S. Kellicott, Columbus, Ohio; G, George F. Atkinson, Ithaca, N. Y.; H, John G. Bourke, U. S. A.; and I, R. T. Colburn, Elizabeth, N. J. Treasurer, Robert S. Woodward, New York.

British.—The sixty-fifth annual meeting of the British Association for the Advancement of Science was held in Ipswich, Sept. 12-18. The officers of the association were: President, Sir Douglas Galton. Section Presidents: A, Mathematics and Physics, W. H. Hicks; B, Chemistry, Raphael Meldola; C, Geology, William Whitaker; D, Zoology, William Herdman; E, Geography, H. J. Mackinder; F, Economic

Science and Statistics, L. L. Price; G, Mechanical Science, J. F. Vernon Harcourt; H, Anthropology, W. M. Flinders Petrie; K, Botany, W. T. Thistleton Dyer. General Secretaries, Sir Douglas Galton and Vernon Harcourt. General Treasurer, Arthur W. Richter.

SIR DOUGLAS GALTON.

General Meeting.—The association began its proceedings with a meeting of the general committee on Sept. 11, when the report of the council was presented by Prof. J. F. Vernon Harcourt, and other business attended to. The meeting was presided over by Sir Frederick Bramwell, a past president. The council at this meeting nominated Prof. E. A. Schäfer for the place of general secretary, made vacant by the advancement of Sir Douglas Galton to the presidency. Twenty-five foreign scientists were elected foreign corresponding members, among whom were Dr. John S. Billings, U. S. A., Philadelphia, Pa.; Prof. D. H. Campbell, Leland Stanford University, Palo Alto, Cal.; Prof. Alfred M. Mayer, Stevens Institute, Hoboken, N. J.; Prof. Henry F. Osborn, Columbia College, New York city; and Gen. Francis A. Walker, Boston, Mass. Various resolutions referred to the council were received, among them being one that was acted on as follows: "The council resolved to express their sympathy with, and approval of the effort which is now being made by the Royal Geographical Society to organize an expedition for the exploration of the Antarctic Sea, but did not consider that any further action could usefully be taken by them at present." Various new members of the committees were chosen, and the re-election of the ordinary members of the council recommended. The treasurer reported that the receipts for 1894-95 were £4,214, and the payments about £977. The investments consisted of £7,337 consols and £3,600 India 3 per cents. On the motion of Dr. Edward Frankland, seconded by Dr. John H. Gladstone, a vote of thanks was adopted for the retiring president, Sir Frederick Bramwell.

In the evening the association met for the purpose of listening to the inaugural address. Owing to the absence of the Marquis of Salisbury, the chair was occupied by Lord Kelvin, one of the vice-presidents, and who introduced the new president by saying: "It was a great disappointment not to have Lord Salisbury with them that evening, but he was sure that every one would rejoice that he was taking such a holiday as it was possible for him to take at this time of the year, and would agree that it was for the public good that he should do so. He had now to yield the chair to Lord Salisbury's successor, Sir Douglas Galton, who for a quarter of a century had been the mainstay of the British Association."

Inaugural Address of the President.—Sir Douglas Galton, in opening his address, called attention to the great loss that science had sustained in the death of Prof. Huxley. He said: "Huxley was pre-eminently qualified to assist in sweeping away the obstruction of dogmatic authority, which in the early days of the association fettered progress in certain branches of science. For, while he was an eminent leader in biological research, his intellectual power, his original and intrepid mind, his vigorous and masculine English, made him a writer who explained the deepest subject with transparent clearness. And as a speaker his lucid and forcible style was adorned with simple and effective illustration in the lecture room; and his energy and wealth of argument in a more public arena largely helped to win the battle of evolution and to secure for us the right to discuss questions of religion and science without fear and without favor." He then said: "About forty-six years ago I began to attend the meetings of the British Association, and I was elected one of your general secretaries about twenty-five years ago. It is not unfitting, therefore, that I should recall to your minds the conditions under which science was pursued at the formation of the association, as well as the very remarkable position which the association has occupied in relation to science. In the absence of railways communication between different parts of the country was slow and difficult. Science was localized, and to overcome this condition the British Association was formed in September, 1831, holding its first meeting in York, with 353 members. The objects of the founders were: 'To give a stronger impulse and a more systematic direction to scientific inquiry; to promote the intercourse of those who cultivated science in different parts of the British Empire with one another and with foreign philosophers; to obtain a more general attention to the objects of science, and a removal of any disadvantage of a public kind which impedes its progress.' At the third meeting, held in Cambridge in 1833, it was already strong enough to induce the Government to grant a sum of £300 for the reduction of the astronomical observations of Bally." Then, taking the condition of certain sciences at the foundation of the British Association, Sir Douglas called attention to the fact that at its first meeting the association initiated a series of reports upon the condition at that time of the various sciences. A glance at some of these reports shows the enormous strides made since 1831 in the investiga-

tion of facts to elucidate the laws of Nature. And many of their reports had brought about very important results. The first cited was on "Tides." No information had been collected prior to 1832 on the tides of the coasts of Scotland and Ireland, but in 1834 the association induced the corporation of Liverpool to establish two tide gauges, and the Government to undertake tidal observations at 500 stations on the coast of Britain. He then made brief allusions to the condition of some of the branches of science in 1831, compared with their present state, drawing his information chiefly from the above-mentioned reports on different sciences made to the association. Under "Geological and Geographical Science," he first contrasted the advances made in geology, and then considered those made in geography. "Chemical, Astronomical, and Physical Science" was his next heading. Of chemistry he said: "The most stupendous advance which we owe to the spectroscopic lies in the celestial direction." Then astronomy was taken up, and he mentioned our own Keeler's verification of "Clerk Maxwell's theory that the rings of Saturn consist of a marvelous company of separate moons." Physics and meteorology were then discussed. The "Biological Sciences" in turn passed under his criticism, including botany, animal physiology, anthropology, and bacteriology. Concerning the last named, he referred to it as a meeting place where the chemist, the physicist, and the statistician unite with the sanitary engineer in the application of the science of preventive medicine." Under "Engineering" he discussed sewerage purification, smoke abatement, mechanical engineering, and metallurgy. The "Influence of Intercommunication afforded by the British Association on Science Progress" he indicated by the opportunities afforded to the young student for making the acquaintance of the leaders in science at the meetings and thereby obtaining the value of this directing influence. The association also gives material aid to many of the investigators whom it brings together by grants of money. The speaker then described the various agencies by means of which science in Germany was fostered by the state and by municipalities, and these he contrasted with the means afforded by way of assistance to scientific research in Great Britain. He said that the British Association had contributed £60,000 to aid research since its foundation. In conclusion, he called attention to the fact that those who nearly half a century ago directed the movement of national education were trained in early life in the universities, in which the value of scientific methods was not at that time fully recognized. Hence the schools neglected for a long time to encourage the spirit of investigation which develops originality. This defect is diminishing rapidly. Another cause is the want of appreciation of science by the Government. It aids it with money; but science is not fashionable, and its students have not received the same measure of recognition which the state accords to services rendered by its own officials, by politicians, and by the army and navy. He closed by expressing full confidence "that the future records of the British Association will chronicle a still greater progress than that already achieved, and that the

British nation will maintain its leading position among the nations of the world, if it will energetically continue its voluntary efforts to promote research, supplemented by that additional help from the Government which ought never to be withheld when a clear case of scientific utility has been established."

Proceedings of the Sections. A. Mathematics and Physics.—This section was presided over by Prof. W. H. Hicks, who is principal of Firth College, in Sheffield. In the beginning of his address he said: "The ultimate aim of pure science is to be able to explain the most complicated phenomena of Nature as flowing by the fewest possible laws from the simplest fundamental data." Then, coming to the immediate topic of his address, he considered certain special theories, or rather two related theories—on the constitution of matter and of ether. They are known as the vortex-atom theory of matter and the vortex-sponge theory of the ether. The opinions of different authorities were then most carefully analyzed, with a view of eliminating their common objections to their acceptance, consequently the strong points in their favor were brought out, and with equal force their inconsistencies were pointed out. In conclusion he said:

The very rapid survey I have attempted to make is no doubt a medley of suppositions and inferences combined with some sound deductions. This is the necessary consequence of a prospecting survey in a region whose surface has been merely scratched by pioneers. My object has been to show that this theory of an ether, based on a primitive perfect fluid, is one which shows very promising signs of being able to explain the various physical phenomena of our national universe. Probably, nay certainly, the explanations suggested are not all the true ones. Some will have to be given up, others modified with further knowledge. We can not proceed to particularize in our second hypotheses until we know more about the properties of such media as we have been considering. Every special problem solved in vortex motion puts us in a position to form clearer ideas of what can and what can not happen. The whole question of vortex aggregates and their interactions is practically untouched, and a rich field is open for mathematical investigation in this portion of the subject. In all cases whether a fluid is an actual fact or not, the results obtained will be of special interest as types of fluid motion. It is at present a subject in which the mathematicians must lead the attack. I shall have attained my object in choosing this subject for my address. If by it I can induce some of our younger mathematicians to take it up and work out its details.

Among the more important papers presented before this section were:

"The Arrangements and Government of the German Reichsanstalt or National Physical Laboratory," by Sir Douglas Galton; "The Teaching of Geometrical Drawing in Schools," by O. Henriet; "On the Electrification and Dielectrification of Air and Other Gases," by Lord Kelvin; "The Equation connecting Difference of Potential Current and Length of the Electric Arc," by Mrs. Ayrton; "Change of Molecular Refraction in Salts and Acids dissolved in Water," by John H. Gladstone; "On the Choice of Magnetic Units," by S. P. Thompson; "Alternate Current Wave Tracer," by J. M. Barr; "The Apparatus for Standardizing High-Temperature Thermometers," by E. H. Griffiths; "On the Back Electromotive Force and True Resistance of the Arc," by Prof. Ayrton and T. Mather; "On the Velocity of Light in a Rarefied Gas through which a Current is Passing," by B. E. Edser and S. G. Starting; and

"On the Hysteresis of Iron in an Alternating Field," by F. G. Baily.

Also the following reports were presented:

"Report on Cosmic Dust," by John Murray; "Report of the Committee on Underground Temperature," by J. D. Everett; and a "Report of the Committee on Electric Standards," by Oliver Lodge.

On the 13th a joint meeting of the section in mathematics and chemistry was held for the purpose of discussing the properties of the new gases argon and helium, as well as for the consideration of some points in spectroscopy. Lord Rayleigh gave an account of the experiments made to determine the index of refraction and the viscosity of argon and helium.

J. H. Gladstone read "Specific Refraction and the Periodic Law"; A. Schuster "The Spectroscopic Separation of Gases"; Prof. Runge "The Spectroscopic Separation of Two Constituents of Helium"; and G. J. Stoney "The Interpretation of Spectra."

On the 14th Section A divided into two departments—one on mathematics, over which Prof. Hicks presided, and before which the following papers were read: "Bicelle Vortex Aggregates" and "Hill's Spherical Vortex," by Prof. W. N. Hicks; "An Ingenious Mechanical Top," by G. T. Walker. The other was on meteorology, over which Prof. Ayrton presided, and before which the following papers were read: "Indian Thunderstorms," by Prof. Miehe Smith; "Some Observations with Lord Kelvin's Portable Electrometer," by Arthur Schuster; and also the following reports: "Report of the Committee on Earth Tremors," by G. J. Symons; "Report of the Committee on the Application of Photography to Meteorology," by G. J. Symons; and "Report of the Committee on Earthquakes in Japan," by Prof. John Milne. On the 16th this section met for consideration of questions connected with the theories of sound and heat. A discussion "On the Objective Character of Combination Tones" was opened by Arthur Rücker, and participated in by S. P. Thompson, Lord Rayleigh, Lord Kelvin, and others. "A New Practical Heat Standard" was described by E. H. Griffiths, and discussed by Prof. Schuster, Lord Kelvin, and others; after which papers on "The Thermal Conductivity of Mixtures of Liquids," by C. H. Lees, and "A Method of comparing the Heats of Evaporation of Different Liquids at their Boiling Points," by William Ramsay and Miss Dorothy Marshall were read.

B. Chemical Science.—The presiding officer of this section was Prof. Raphael Meldola, who fills the chair of Chemistry in Finsbury Technical College, City, and Guilds of London Institute. Prof. Meldola, at the beginning of his address, contrasted the condition of chemistry at the time when the association met last (1851) in Ipswich with our present knowledge of that science. "The so-called new chemistry," he said, "was being evolved about the period when the British association last assembled in Ipswich, but it was not till some years later that the modern views were accepted. It was at that meeting that the nomenclature of organic compounds formed the subject of a report by Dr. Danbury. It was about 1851 that the era of structural or constitutional chemistry based on the

doctrine of the solvency of the atoms began, and thereafter the course of development concentrated itself in two channels. In one we find the result of the labors of those who regarded chemistry from the physical side, and in the other the series of discoveries of those who made a speciality of the valency doctrine and its extension to the structure of chemical molecules. Concerning the present state of structural chemistry, he said:

Pending the rationalization of the doctrine of valency its promulgation must continue in its present form. Its services in the construction of rational formulae have been incalculable. It is the ladder we have climbed to the present brilliant achievements in chemical synthesis, and we are not in a position to perform the ungracious task of kicking it away, and the present position of structural chemistry may be summed up in the statement that we have gained an enormous insight into the anatomy of molecules, while our knowledge of their physiology is as yet in a rudimentary condition. Of the progress of synthetical chemistry he spoke encouragingly. According to a census made by him 180 syntheses of natural compounds had been made since 1828. It is by the combination of our knowledge of structural chemistry applied to chemical synthesis that the great mysteries of vital chemistry will be solved. The decisive settlement of whether a stereo-chemical relationship between the living and dead compounds entering into combination is not an absolutely essential condition of all assimilation will be a step onward toward the solution of the mystery that still surrounds the chemistry of the living organism.

In conclusion, he discussed the recent discoveries of gaseous elements, referring to the discovery of argon and the more recent announcement of helium. With respect to the position of argon and helium in the periodic system of chemical elements, he agreed with Prof. Ramsay that it was still too premature to speculate and could not be decided until it was certain that these gases were homogeneous.

The following-named papers were among those read before this section:

"A New View of the Genesis of Dalton's Atomic Theory," by Sir Henry E. Roscoe and Dr. A. Harden; "The Action of Nitric Oxide on Certain Salts," by H. A. Aulsen and G. J. Fowler; "The Respirability of Air in which a Candle Flame has burned until it is extinguished," by Arthur Clowes; "The Action of Light upon the Soluble Metallic Iodides in Presence of Cellulose," by D. J. P. Berridge.

On the 16th the section met with the section on botany to discuss the relation of agriculture to science, and Prof. Meldola presided over the joint meeting, at which R. Warrington read a paper on "How shall Agriculture best obtain the Help of Science?" A second paper was contributed by T. Hendrick and one by M. J. R. Dunstan, after which much discussion generally participated in took place. On Sept. 17, which was the day set apart for papers on photography and physical and organic chemistry, the following were presented:

"On Orthochromatic Photography," by H. W. Vogel; "The Sensitizing Action of Dyes in Gelatin-bromide Plates," by C. H. Bothamley; "The Formation and Properties of a New Organic Acid," by H. J. H. Fenton; and "The Chemical History of the Barley Plant," by C. F. Ross and C. Smith.

Also the following reports were presented:

"Report of the Committee on the Teaching of Science in Elementary Schools," by Dr. John H. Gladstone; "Report of the Committee on Quantitative Analysis by Means of Electrolysis," by Dr. C. Kohn; "Reports of the Committee appointed to prepare a New Series of Wave-length Tables of the Spectra of the Elements," by Sir Henry E. Roscoe; "Report of the Committee on the Preparation of Pure Haloids"; and the "Report of the Committee on the Bibliography of Spectroscopy."

C. Geology.—This section was presided over by William Whitaker, who is connected with the Geological Survey of Great Britain. He chose as the subject of his address "Underground in Suffolk and its Borders."

The object of this address is to carry you below the surface, and to point out how much our knowledge of the geology of the country in which we meet has been advanced by engineers and others in their search for water. This information has accumulated since 1851, for of the 476 Suffolk wells, of which an account with some geologic information has been published, only 68 were noticed before that year. Of the Drift it may be said that it is only from the wells that we can tell its thickness over most of this plateau. Sometimes the sections seem to point to the existence of channels filled with Drift, such as are also found in Essex and in Norfolk. Less information is available of the Crag, as it is not so widespread; still the evidences show it to be far thicker than was supposed. Below the Crag there is a great gap in the geologic series, and we reach some of the lower Tertiary formations. The important evidence obtained is showing the great underground extent of the older Tertiary beds. The chalk is reached by many wells, yet, owing to its great thickness, but little information is available about it. No case is on record of the chalk being pierced from top to bottom in Suffolk. From the base of the chalk we pass out of the region of facts into the realm of speculation. To the question, "What rocks underlie the Cretaceous beds at great depths?" consideration is asked. From the fact that there is no area of old rocks at the surface in our island south of the Forth in which coal measures are not a constituent formation, and on the principle of reasoning from the known to the unknown, I can not see why we should expect anything but a like occurrence of coal measures in detached basins in our vast underground tract of old rocks. The question of finding and of working coal in various parts of southeastern England is not merely of local interest; it is of national importance. The time must come when the coal fields that we have worked for years will be more or less exhausted, and we ought certainly to look out ahead for others, so as to be ready for the lessening yield of those that have served us so well. It is on our coal that our national prosperity depends, and, as far as we can see, will depend. Let us not neglect any of the bounteous gifts of Nature, but let us show rather that we are ready to search for the treasures that may be hidden under our feet, and the finding of which will result in the common welfare of our native land.

Appended to the address was a list of the chief papers on the old rocks underground in southeastern England since 1889, when the subject was treated of in the memoir on the "Geology of London," etc.

Among the papers read before the section were the following: "On Recent Coast Erosion at Southwold and Covehithe," by John Spiller; "On the Southern Character of the Molluscan Fauna of the Coralline Crag, tested by an Analysis of its Characteristic and Abundant Shells," by F. W. Harmer. On Sept. 15 this

section devoted itself to the consideration of vertebrate palaeontology, and the first paper presented was one by Prof. O. C. Marsh, of Yale University, which was illustrated by a large number of drawings, after the discussion of which Montague Browne presented "A Preliminary Notice and Measurements of an Exposure of Rhatic Beds on the Confines of Leicestershire and Nottinghamshire." On the 16th the proceedings of the section related to Tertiary formations and earthquake phenomena, and possessed more than ordinary interest on account of papers read by the French geologist F. Dollfus and M. K. Van den Broeck, and an address on "Earth Movements observed in Japan," by Prof. John Milne. Papers were also presented

"On Auriferous Conglomerates of the Witwatersrand Transvaal," by F. H. Hatch; "On the Dip of the Underground Palaeozoic Rocks at Ware and at Turnford," by Joseph Francis; "The Importance of extending the Work of the Geological Survey of Great Britain to the Deep-sea Bed Rocks by Means of boring," by F. W. Harmer; and an oral address was given by Prof. Edward W. Claypole, of Akron, Ohio, on "The Cladodonta of the Upper Devonian of Ohio."

D. Zoölogy.—Over this section Prof. William A. Herdman, who fills the chair of Natural History in University College, Liverpool, presided. The speaker called attention to the fact that this year, for the first time in the history of the British Association, Section D meets without including in the range of its subject-matter the science of botany. Of zoölogy he said:

We include also in our subject-matter, besides the adult structure and the embryonic development of animals, their distribution both in space and time, the history and structure of extinct forms, speleography and classification, the study of the habits of animals, and all that mass of lore and philosophy which has gathered around inquiries into instinct, breeding, and heredity. He then briefly reviewed the progress of zoölogy since the meeting of the association in Ipswich in 1881, and called special attention to the recent completion of the reports of the scientific results of the "Challenger" expedition, a magnificent series of 60 quarto volumes, which have left an indelible mark upon science, and will remain through ages, exercising a powerful influence. It is the final volumes of this series that have given definiteness of scope and a tremendous impulse to that branch of science—mainly zoölogical—which is coming to be called oceanography. It is in this laminarian zone probably that, under stress of competition between individuals and allied species, evolution of new forms by means of natural selection has been most active.

Bionomics, which deals with the habits and variations of animals, their modifications and the relations of these modifications to the surrounding conditions of existence, was then taken up. Finally, he discussed aquiculture, or industrial ichthyology, the scientific treatment of fishery investigations, what chemistry is to the aniline, the alkali, and some other manufactures, marine zoölogy is to our fishing industries. In conclusion he said:

But if the zoölogist has great opportunities for usefulness, he ought always to bear in mind that he has also grave responsibilities in connection with fisheries investigations. Much depends upon the results of his work. Private enterprise, public opinion, local regulations, and even imperial legislation, may all be affected by his decision. He ought not lightly to come to conclusions upon weighty matters. I am con-

vinced that of all the varied lines of research in modern zoölogy none contain problems more interesting and intricate than those of bionomics, oceanography, and the fisheries; and of these three series, the problems connected with our fisheries are certainly not the least interesting, not the least intricate, and not the least important in their bearing upon the welfare of mankind.

Among the papers read before this section were the following:

"The Royal Dublin Society's Fishery Survey of the West Coast of Ireland" and "The Fishery School at Ringsend," by A. C. Haddon; "Oyster-cultural Methods, Experiments, and Improvements," by Dr. Bashford Dean of the United States Fish Commission; "Marine Zoölogy, Botany, and Geology of the Irish Sea," by Isaac C. Thompson; "Stereornithes, a Group of Extinct Birds from South America," by C. W. Andrews; "The Presence of Skeletal Elements between the Mandibular and Hyoid Arches of Hexanchus and Lamargus" and "The Presence of a Sternum in Hexanchus Griseus," by Philip White.

On the 15th a sitting of this section was held at sea on board a steamer that had been chartered for a dredging excursion off Harwich. On the 16th an address on "Our Present Knowledge of the Causes and Conditions of Insect Transformation," by L. C. Miall, was presented, and also the following papers:

"On the Conditions affecting Bacteria Life in River Water," by Edward Frankland; "The Marine Fauna of Houtman's Abrolhos Islands, West Australia," read by W. Saville-Kent; "Hereditary Polydactylism" and "Reproduction of the Common Crab," by Gregg Wilson; "Some Observations on Instinct in Young Birds," by Lloyd Morgan; "Notes on the Early Development of the Ganoid Fishes," by Dr. Bashford Dean; "Medusæ captured by the United States Steamer 'Albatross,'" by Otto Maas; "Spermatogenesis in Birds," by J. E. S. Moore; and "Mammalian Hyoid," by Prof. Howes. Also several reports were presented, including one "Upon Oysters and Typhoid" and one on "The Organization of Zoölogical Bibliography"; the last was presented by Dr. H. H. Field, of the United States.

E. Geography.—The presiding officer of this section was H. J. Mackinder, of Christ Church, Oxford, and his address treated chiefly of comparative and philosophical geography in relation to secondary and university education.

The eighteenth century was a transition age of importance to geography because of new problems indicated by the terms lithosphere, hydrosphere, and atmosphere. The first business of the geographer is to define the form or relief of the surface of the solid sphere and the movements or circulation within the two fluid spheres. The land relief conditions the circulation, and this in turn gradually changes the land relief. The circulation differentiates climates, and these together with the relief constitute the environments of plants, animals, and men.

The speaker sketched the lives and work of Humboldt, Ritter, and Peschel, and pointed out that the most modern research tends to show that Chinese civilization was of Western origin.

Since the war between France and Germany in 1870 chairs of geographical science have been multiplied throughout Europe, especially in Germany. The development in original work has been in different directions, but in geomorphology the advance has been most rapid. There are three arts—observation, cartography, and teaching. The observer obtains materials for maps, which are constructed

by the cartographers and interpreted by the teacher. The anthropogeographer is the most typical and complete of all geographers. His special department requires a knowledge of all the other departments. His most study geomorphology without becoming a geologist, physiography without becoming a biologist. The value and possibilities of geography are not generally appreciated in England. Geographers must associate with themselves experts in education if they are to avoid certain rocks which have knocked many a hole into the geographical projects of the past, and if public bodies and private individuals are to be moved to financial generosity. The beginning might be on a relatively small scale, but must not be too small for completeness. Theory, both on the scientific and historic sides, must be represented in the last of the three geographical arts. As regards observation, nothing better could be asked than association with the admirable classes already existing. Cartography would be needed, not only to supply the map trade in Great Britain with an occasional map such as is made by Petermann, but especially that all serious students might learn the way of the geographical workshop.

Among the papers read before this popular section were:

"A Journey in Tarhuna and Gharian in Tripoli," by H. S. Gwyper; "About Rockall," by Miller Christy; "Western Siberia and the Siberian Railway," by Dr. A. Markoff; "A Voyage to the Antarctic Sea," by O. E. Borchgrevink; "Some Recent Physical Work in the North Atlantic, the North Sea, and the Baltic," by H. N. Dickson; "Oceanic Circulation," by John Murray; "Cosmosphere, an Instrument combining the Terrestrial and Celestial Globes for the Purpose of demonstrating Astronomical Geographical Phenomena and Navigation Problems," by W. B. Blaikie; "An Expedition to Ruwenzori, the Highest Peaks of a Mountain Range which are evidently the Blue Mountains of Sir S. Baker, and the Mountains of Usongora," by G. F. Scott-Elliot; "Report on the Climate of Africa," by E. G. Ravenstein; "Three Years' Travelling and War in the Congo Free State," by S. L. Hinde; "The Progress of the Jackson-Harmsworth Polar Expedition," by A. Montefiore; "Life and its Conditions in Arctic Lands," by A. Trevor Battye; "On Formosa," by H. N. Dickson; "On the Russian Possessions in Central Asia" and "On the Towns of Northern Mongolia," by A. Markoff; "On the Topography of Korea," by J. L. Myres; and a "Report of the Committee on the Exploration of Southern Arabia," by J. Theodore Bari.

F. Economic Science and Statistics.—This section was presided over by Mr. L. L. Price, of Oriel College, Oxford. He said in reference to the particular questions of the day:

It is well to determine the general character of the guidance offered by economics in matters of practice. In this connection economists must disclaim a pretension to strict neutrality. Much, no doubt, may be urged in support of the claims and considerable advantages might follow from its successful establishment. The cool examination of heated questions in the clear light of science might seem the appropriate occupation of the academic professor. Economists have been reproached for hardness of heart and dullness of imagination, and the popular account is prone to regard them as dry and unfeeling; but the description is a travesty of the facts, and their errors have probably been due as often to excess as to lack of enthusiasm. The besetting sin of the academic temper is indecision, and few errors are more mischievous in practical affairs. An obstinate regard for neutrality may easily beget indecision, and from that moment the economist becomes ineffectual for practice. The modern economist is inclined to state his

opinion with less assurance, and for that very reason has lost some of his influence on practical affairs. For the practical man has a sneaking affection, and even respect, for dogmatic assertion. . . It was the interest of the employer that the wages earned by the men should be adequate to maintain, and, if possible, to increase their efficiency; and it was the interest of the employed that the profits of the *entrepreneur* should encourage enterprise and induce a sufficient supply of capital. For production—and that was a point which economics alone could duly emphasize—was the ultimate source of wealth distributed. The larger the amount procured the larger was likely to be the share of either party in distribution, and in any event it was certain that a decreased production must issue in effects on distribution, the burden of which would fall, though in varying measure, on either party. The influence thus exerted on distribution by production was one which workmen seemed especially likely to forget, and many of the common arguments in favor of "making work" or "providing employment for the unemployed" proceeded from ignorance or neglect of consideration. One of the most important advances of recent economics consisted in the emphasis given to the influence of distribution in production, and they saw more clearly than their predecessors how the poverty of the poor, by begetting insufficiency, might cause their poverty, and high wages might imply not a high but a low cost of production.

The following were among the principal papers presented before the section:

"A Comparison of the Rate of Increase of Wages in the United States and Great Britain, 1860-1891," by A. L. Bowley; "Bimetallism with a Climbing Ratio," by H. Higgs; "The Currency Question," by W. A. Shaw; "The Gold Standard," by George Peel; "The Menace to English Industry from the Competition of Silver-using Countries," by R. S. Gundry; "The System that prevails in Scotland for the Preservation of the National Parochial Registers," by H. Paton; "On Agriculture in Suffolk from the Landlord's Point of View," by E. G. Pretyman; "The Probability of a Cessation of the Growth of Population in England and Wales before 1961," by Edwin Cannan; "The Correlation of the Rate of Total Pauperism with the Proportion of Outdoor Relief given," by G. U. Yule; "The State and Workers on the Land," by J. Frome Wilkinson; and "The National Value of Organized Labor and Co-operation among Women," by Mrs. Bedford Fenwick.

G. Mechanical Science.—L. F. Vernon Harcourt, of the Institute of Civil Engineers, was the presiding officer of this section, and he delivered an inaugural address on "The Relation of Engineering to Science." At the outset he expressed the belief that it would be best to limit his topic to consideration of the relation that engineering in general, and maritime and hydraulic engineering in particular, bear to pure science, and the means by which progress in engineering science might be best promoted, and its scope and utility increased. After discussing several well-known definitions of engineering he referred to the equipments of an engineer, and said:

Among the branches of science necessary for the engineer, two may be regarded as of the highest importance—namely, mathematics and physics. Other sciences of comparatively minor importance to engineers are chemistry, geology, and meteorology. Pure mathematics in its higher branches appears to have a less direct connection with engineering, but applied mathematics can not be safely neglected by the engineer. Under physics he spoke of the many problems where a knowledge of science was neces-

nary, notably in matters pertaining to compressed air, to illumination, to acoustics, and electrical engineering. Many instances, such as gas making, manufacture of explosives, and even utilization of sewerage, were mentioned as requiring a knowledge of chemistry from the engineer. The whole subject of mining demands an acquaintance of geology on the part of the engineer. Under meteorology he showed the value of a knowledge of the force exerted by the winds on certain structures, also of matters pertaining to rainfall and the like. He then pointed out the many benefits conferred by engineers on pure science, and also referred to the fact that every branch of engineering science is more or less capable of being advanced by experimental investigations. The neglect of scientific considerations was often the cause of failures of works. Thus the Tay bridge disaster, in 1879, was due to underestimating the amount and effect of the wind pressure in an exposed situation. Much of the final portion of his address was devoted to a consideration of the training of engineers. In engineering, as in pure science, it is impossible to stand still; and engineers require to be ever learning, ever seeking to appreciate more fully the laws of Nature and the revelations of science, ever endeavoring to perfect their methods by the light of fresh discoveries, and ever striving to make past experience and a wider knowledge stepping stones to greater achievement. Engineers have a noble vocation, and should aim at attaining a lofty ideal; should regard their profession not so much as an opportunity for gaining a pecuniary reward as a means of advancing knowledge, health, and prosperity.

Among the papers presented before this section were the following:

"Light Railways as an Assistance to Agriculture," by Gen. C. E. Webster; "A Description of the Machinery employed in East Anglian Coal Exploration," by J. Vivian; "The Effect of Wind and Atmospheric Pressure on the Tides," by W. H. Wheeler; "The Gobert Freezing Process for Shaft Sinking and Tunneling under Rivers," by M. A. Gobert; "The Growth of the Port of Harwich," by William Birt; "The New Outlet of the River Maas at the Hook of Holland and the Improvement of the Scheur Branch up to Rotterdam," by L. F. Vernon Harcourt; "Some Notes of Facts and Figures relating to the Autumn Floods of 1894," by G. J. Symons; "The Dredging Operations on the Mersey Bar," by A. G. Lyster; "On Carbonic Anhydride Refrigerating Machinery," by E. Hasketh; "The Hermite Process for Deodorizing Sewerage," by J. Napier; "The Modern Applications of Electricity to Traction Purposes," by Philip Dawson; "An Improved Portable Photometer," by A. P. Trotter and W. H. Preece; "Some Lessons in Telephony," by A. R. Bennett; "The Field Telegraph in the Chitral Campaign," by P. V. Luke; "A Movement designed to attain Astronomical Accuracy in the Motion of Siderostats," by G. J. Stoney; "Modern Flour-milling Machinery," by F. W. Turner; "The Linotype Composing Machine," by J. Southward; "Memorandum on the B. A. Screw Gauge for Small Screws," by T. E. Crompton; "A Uniform Factor of Safety for Boilers and Machinery in Steamships," by F. Key; "Experiments in the Transfer of Heat through Plates with variously Arranged Surfaces," by W. G. Walker; and "A New Principle of Aerial Navigation," by B. Baden Powell.

H. *Anthropology*.—The presiding officer of this section was Prof. W. M. Flinders Petrie, who discussed anthropology more as the study of man in relation to various and often independent subjects than as an organic and self-contained science.

Human nature is greater than all formulae, and we may as soon hope to compact its study into a logical structure as to construct an algebraic equation for

predicting its course of thought. Two of the commonest and most delightfully elastic words in the subject may be looked at once more—"race" and "civilization." The definition of race is the most requisite element for any clear ideas about man. The only meaning that a "race" can have is a group of persons whose type has become unified by their rate of assimilation and affection by their conditions exceeding the rate of change produced by foreign elements. If the rate of mixture exceeded that of assimilation, then the people were a mixed race, or a mere agglomeration, like the population of the United States. The greatest problems awaiting solution were the conditions and rate of assimilation of races: namely, what period and kind of life was needed for climate and other causes to have effect on the constitution and structure, what were the causes of permanence of type, and what relative powers of absorption one race had over another. Until these problems were reduced to something that could be reasonably estimated, they could only grope in the dark as to all racial question. In conclusion the speaker said: "It is the business of anthropology to make a knowledge of all other civilizations a part of all decent education. The origin and utility of the various customs and habits need to be pointed out, and in what way they are reasonable and needful to the well-being of the community. And, above all, we ought to impress on every boy that this civilization in which he grows is only one of innumerable experiments in life that have been tried; that it is by no means the only successful one, or perhaps not the most successful, that there has been; that there are many other solutions of the problems of community and culture which are as good as our own, and that no one solution will fit a different race, climate, or set of conditions. The highest form of this perception of other existences is only reached in the best history writing or fiction which enables the reader to strip himself for the time of his prejudices and views of life and reclothe the naked soul with an entirely different personality and environment."

The more important papers read before this section were the following:

"The Remains of the Native Indian Inhabitants of Jamaica," by Sir William H. Flower; "The Neolithic Invaders of Egypt," by W. M. Flinders Petrie; "Stone Implements from Somaliland," by H. W. Seton-Karr; "On Flint and Metal Working in Egypt," by W. H. Flinders Petrie; "Striated Flint Implements from the North of Ireland," by W. J. Knowles; "The Megaliths of Tripoli," by Swainson Cowper; "On the Kitchen Midden at Hastings," by W. J. Lewis Abbot; "On Cannibalism and the Pygmy Tribes in the Congo Basin," by Capt. S. L. Hinde; "The Habits of Human 'Leopard' Cannibals of the West Coast of Africa," by Scott Elliot; "The Samoyeds of the Arctic Tundra," by Arthur Montefiore; "Horns of Honor, Dishonor, and Safety," by F. T. Elworthy; "The Religious Origin of Dances," by Mrs. Lilly Grove; "Upon Anthropometric Observations in East Aberdeenshire," by J. Gray; "Suffolk Dialect," by C. G. de Bethune; "General Conclusions with regard to Folklore," by Edward Clodd.

On the 18th the section devoted itself to a general discussion of "Interference with the Civilization of Other Races," in which the chairman, Lord Stanmore, Prof. Haddon, Dr. R. N. Cust, Dr. H. O. Forbes, Ling Roth, and others took part. Subsequently the following papers were read:

"On the Neolithic Station of Butmir in Bosnia," by R. Munro; "Primitive European Idols in the Light of Recent Discoveries," by Arthur Evans; "A Paleolithic Skeleton from the Thames Valley," by Dr. Garson; and "The Light thrown on Primitive Warfare by the Languages and Usages of Historic Times," by G. Hartwell Jones.

Also, the following reports were presented:

"Report of the Committee for Investigating the Northwestern Tribes of Canada," "Report of the Committee on the Mental and Physical Deviations of Children," "Report of the Committee on Anthropometric Measurements in Schools," and "Report of the Committee on the Lake Village of Glastonbury."

I. Physiology.—No papers were read before this section.

K. Botany.—This section was presided over by Mr. W. T. Thistleton Dyer, director of the Royal Gardens in Kew. He said:

The establishment of a new section of the association devoted to botany can not but be regarded by English botanists as an event of the greatest importance. This severance of the two great branches of biology is inevitable from force of circumstances, for specialization is inseparable from scientific progress; but it will defeat its own end in biology if the specialist does not constantly keep in touch with those fundamental principles which are common to all organic Nature. In taking a retrospective view the names of Robert Brown, Henslow, Sir Joseph Hooker, Carpenter, and Charles Darwin can not be forgotten. It was Robert Brown who gave the first description of the nucleus of the cell. There are few men in this country who have indirectly more influenced the current of human thought than Henslow. Darwin speaks of his friendship with Henslow "as a circumstance which influenced my whole career more than any other." If, however, the old school of natural history, of which Henslow was a living spirit, is now, as it seems continually, losing its hold upon us, this has certainly not been due to its want of value as an educational discipline, or to its sterility in contributing new ideas to human knowledge. Asa Gray has compared Robert Brown with Darwin as "the two British naturalists" who have "more than any others impressed their influence upon science in the nineteenth century." The Darwinian theory, being the outcome of the natural-history method, rests at every point on a copious basis of fact and observation. Modern speculation is lacking in respect of this basis. Most of the new writers on the Darwinian theory, especially those who have been trained at Cambridge, generally begin by rejecting it as a theory of the origin of species, and then proceed unhesitatingly to reconstruct it. Little interest seems to be taken in systematic and descriptive botany, and geographical distribution is almost in a worse plight; yet Darwin calls it "that grand subject, that almost keystone of the law of creation." The greatest and most fundamental problem of all is that of assimilation. The very existence of life upon the earth depended upon it. The soil was slowly, but he thought surely, being lifted from its secrets. They know that starch, if its first visible product, was not its first result. If capacity and earnestness afforded an augury of success, the prospects of the future of the section possessed every element of promise.

The following were among the more important papers read before this section:

"An Account of a False Bacterium," by Marshall Ward; "Some Remarks on the Archeosporium," by F. O. Bower; "The Occurrence in New Zealand of Two Forms of Peltoid Trentepohliaceae," by A. Vaughan Jennings; "The Variations of Yeast Cells," by E. C. Hansen; "The Results of Williamson's Work on the Carboniferous Plants," by Dr. D. H. Scott; "Experiments on the Pangium Tree," by Dr. T. M. Treub; "A Supposed Case of Symbiosis in Tetraphodon," by Prof. Weiss; "Concerning the Structure of Bacterial Cells," by H. Wager; "The Diurnal Variation in the Amount of Diastase in Foliage Leaves," by Reynolds Green; "The Wealden Flora of England," by A. C. Seward; and "English Amber," by Prof. Conwentz.

Popular Features.—On the evening of Sept. 12 a *soirée* was given in the Ipswich Museum, under the auspices of the Ipswich Scientific Society and the Suffolk Institute of Archaeology. A discourse on "Magnetism in Rotation" was delivered on the evening of Sept. 13 by Prof. Silvanus P. Thompson. Saturday, Sept. 14, was devoted to excursions; these included whole-day excursions to Southwold and Oxford and half-day excursions to Bury St. Edmunds, to Helmingham Hall, and to Wenham Hall and Hadley. The lecture to workmen was on "Color," and was delivered on Saturday evening by Dr. Alfred Fison. "The Work of Pasteur and its Various Developments" was the theme of the second evening discourse, given by Dr. Percy F. Frankland, on the 16th.

Among the foreign scientific men attending the meeting were Frederick Bedell, of Cornell University, Ithaca, N. Y.; C. E. Curry, of Munich; A. P. N. Franchimont, of Leyden; Gustave Gilson, of Louvain; Othniel C. Marsh, of Yale University, New Haven, Conn.; Dr. Otto Maas, of Munich; Prof. Paschen, of Hanover; Ira Remsen, of Johns Hopkins University, Baltimore, Md.; Dr. van Rijkevorsel, of Rotterdam; Prof. Runge, of Hanover; and Dr. T. M. Treub, of Buitenzorg, Java.

Attendance and Grants.—At the meeting of the General Council, held on Sept. 18, the treasurer reported an attendance of 1,324 persons, of whom 31 were new annual members and 493 were associates. The receipts were £1,236, of which £1,160 were distributed among the sections in grants for research as follow: Mathematics and physics, £250; chemistry, £80; geology, £140; zoölogy, £405; geography, £10; mechanical science, £40; anthropology, £180; physiology, £25; and corresponding societies, £30. According to "Nature": "Coming after the Oxford year, the meeting in Ipswich is in numbers comparatively small; but from a scientific point of view everything augurs well."

Next Meeting.—The association will meet in 1896, in Liverpool, beginning on Sept. 16. The invitation to meet in Toronto, Canada, in 1897 was renewed, and was unanimously accepted. An invitation from Bournemouth was received for 1898. Sir Joseph Lister, eminent as the father of antiseptic surgery, who is foreign secretary of the Royal Society, was appointed as president-elect for the meeting in Liverpool in 1896. Besides the election of the vice-presidents named for that meeting, the re-election of the general secretary, the assistant general secretary, the treasurer, and the ordinary members of the council then took place.

Australasian.—The sixth annual meeting of the Australasian Association for the Advancement of Science was held in Brisbane, Queensland, beginning on Jan. 11 and ending on Jan. 18, with excursions on Jan. 19, 21, and 23. The officers of the meeting were as follow: President, A. C. Gregory. Section Presidents: A. Astronomy, Mathematics, and Physics, Alexander McAulay; B. Chemistry, J. H. Maiden; C. Geology and Mineralogy, T. W. Edgeworth David; D. Biology, Arthur Dendy; E. Geography, Baron F. von Mueller; F. Ethnology and Anthropology, Thomas Worsnop; G. Economic Science and Agriculture, W. Scott; H. Engineer-

ing and Architecture, James Fincham; I, Sanitary Science and Hygiene, J. W. Springthorpe; J, Mental Science and Education, Francis Anderson. Permanent Secretary, A. Liversidge. General Treasurer, H. C. Russell. General Secretaries, John Shirley and C. W. De Vis.

Opening Session.—The formal opening of the Brisbane meeting began on Jan. 12 with a meeting of the sectional committee to complete arrangements for work during the session. Almost immediately after the general council convened, and owing to the absence of Prof. Tate,

A. C. GREGORY.

Vice-President Russell occupied the chair. The business before the council included the confirming of the arrangements of the local committee and ratifying the selection of sectional officers. Other business included the naming of Prof. Archibald Liversidge as president for the meeting to be held in Sydney. Minor officers and local secretaries were also chosen. The opinion that, owing to the small number of members and the large extent of territory, yearly meetings were too frequent was presented, and it was proposed that they be held once in two years. The dividing of Section I, Mental Science and Education, was referred to a committee of that section for report, as was also the proposed division of Section G, Economic Science and Agriculture.

President's Address.—Owing to the absence of Ralph Tate, the retiring president, H. C. Russell, Government Astronomer of New South Wales, presided at the meeting on the evening of Jan. 12, held in Centennial Hall. After deploring the absence of Mr. Tate, he said: "No one has done more for the advancement of science in Australia than Mr. Gregory. His work is intimately known by every colonist, and even by those living in remote regions of the Northern Hemisphere." He then introduced Mr. Gregory, who proceeded at once to deliver his inaugural address on "The Geographical History of the Australian Continent during its Successive Phases of Geological De-

velopment." He said: "The earliest indications of the existence of land within the limits of the present Australian continent consist in the fact that many of the more elevated summits are composed of granite, which is certainly the oldest rock formation with which we are acquainted." These were found in Tasmania and in Western Australia. From the granite he passed to the sedimentary deposits, in which were the Laurentian, Cambrian, and Silurian rocks. These were principally developed in Queensland to the north and in Victoria to the south. Then came the Devonian and the first appearance of organic life. More of the land came up from the sea. The principal elevation was on the eastern coast, where the rise must have been several thousand feet, while on the west it was less pronounced, though the area added to the land included nearly the whole of what is now Western Australia. The auriferous deposits in lodes are found in the disrupted strata of this period. As to the sources from which the gold was derived, there were many speculations, but that which best accorded with the actual conditions "is that the metal exists in very minute quantities in the mass of the adjacent rocks from which it has been transferred through the agency of electric currents and the solvent action of alkaline chlorides which dissolve small quantities of the precious metals, and would be subject to decomposition at the places where fissures cause greater resistance to the electric current." The geology of the Queensland gold mines was discussed, those of Gympie cited as instructive examples of fissure lodes. Passing upward, he said that from the middle to the close of the Permo-carboniferous period the dry land teemed with vegetation, of which the lepidodendron was a conspicuous type. The geographical features of this period show a continent somewhat similar in form to that of the present Australia. At about the end of the Palaeozoic or the beginning of the Mesozoic period there was a further elevation, especially in the eastern part. The vegetation that followed this period was well adapted for the formation of coal deposits. As the Cretaceous began, a general subsidence took place and the coal deposits ceased. Soft shales were formed, fresh-water vegetation and various mollusks of the Cretaceous are conspicuously found. The depression during the Cretaceous was gradual and of long duration. On the east coast the ocean rose from 100 to 200 feet above its present level in Queensland. The central and western parts of the continent were almost entirely submerged. At the close of the Mesozoic Australia was reduced to the area of a large island on the east coast and some small islands on the southwest and northwest of the present continent. Early in the Tertiary a new elevation of the land began, but the rise was not attended by any great disturbance of the strata, and the present outline of the continent was assumed by Australia. The valleys and river systems as they now are came into existence chiefly in consequence of volcanic action, and in time came the gigantic marsupials of Australia, whose remains only are found. Abundant rainfalls were conspicuous events during the drift, after which the climate gradually became drier and

the huge marsupials disappeared. In a word, the climate at the time of the last elevation maintained a magnificent system of rivers, which drained the interior into Spencer's Gulf, but the gradual decrease in rainfall has dried up these water-courses, and their channels have been nearly obliterated and the country changed from one of great fertility to a comparatively desert interior, which can only be partially reclaimed by the deep boring of artesian wells.

A. Astronomy, Mathematics, and Physics.—This section was presided over by Alexander McAulay, who fills the place of lecturer on mathematics and physics at the University of Tasmania. His address was "On Some Popular Misconceptions of the Nature of Mathematical Thought," and was essentially a proposition to discontinue the adverse criticisms of metaphysicians by mathematicians and of mathematicians by metaphysicians. He reviewed the relative benefits accruing to mankind and the student and discussed the mental and moral faculties called into play by the study of the more exact and less exact sciences, assigning a high place to logic, mathematics, and physics. In conclusion he summed up the peculiar characteristics of the science of mathematics as follows: "It is unique in the cosmic nature and the universality of the questions it deals with, in the stability of the data on which it rests, on the reliableness of the assistance it renders to every other science which has become sufficiently highly generalized or sufficiently precise. It has been disputed whether mathematics is a branch of logics or logic a branch of mathematics. If we group them together for the moment we may say that they are further unique in the almost inconceivable exactness of their methods and in their being exclusively an intellectual product as opposed to a combined intellectual and observational one. It may be added that, notwithstanding the purely intellectual nature of the subject, notwithstanding the highly general nature of most of its results, the mere volume of these results, as in so many other sciences, is so great that it is impossible now for a single man to be really conversant with any but a small portion of the whole. The prospects opened up to the merely acquisitive mathematician, however great his powers, in that direction are far more than sufficient for his lifetime, whereas the inducements offered to him who would walk where no man walked before are only rendered the more numerous, in that mathematics from its very extension provides more points of contact of the known and unknown than in any former age."

The following papers were read and discussed before the section:

"The Maintenance of Solar Energy," by the Archbishop of Hobart; "Why do we not take a Deeper Interest in Astronomy?" by Rev. Thomas Roseby; "Conjecture as to the Present Stage of the Life History of Mars, from Comparisons of the Earth, Mars, and the Moon," by J. Ewen Davidson; "On the Longitude of the Boundary Line between South Australia and the Eastern Colonies," by Pietro Baracchi; "Advancement of Astronomy in the Southern Hemisphere," by R. T. A. Innes; "Transit of Mercury, Nov. 11, 1894. Scientific Results," by J. P. Thomson; "On a Form of the Differential Equations of Dynamics," by Sir Robert Ball; "Some Notes on the New Royal Observatory, Edinburgh," by Ralph

Copeland; and "The Energy of the Electro-magnetic Field," by Prof. Bragg.

B. Chemistry.—The presiding officer of this section was J. H. Maiden, Superintendent of Technical Education, New South Wales. He spoke on "The Chemistry of the Australian Indigenous Vegetation." His address was divided into two portions. The first included a discussion of the questions "(1) What had been done in the direction of chemically investigating our indigenous plant products? (2) What remains to be done? (3) How can it best be done?" At the outset he took up the workers and deplored the lack of requirement of proper qualifications for analytical chemists, and urged the formation of a pharmaceutical subsection in the association whose influence should correspond to that of the British Pharmaceutical Conference. He then proceeded to deal in detail with the following items: Human food and food adjuncts; fungi; algae; forage plants—(a) grasses, and (b) salt bushes and other fodder plants; plants poisonous to stock; substances reputed medicinal—drugs; narcotics; fish poisons of the aborigines; gums; resins; kinos; eucalyptus oils; other essential oils; fixed oils; perfumes; dyes of tinctorial substances; tans; timbers; and fibers. He said in closing: "Here is a mighty list. Surely no chemist desirous of taking up original research can complain of the variety of work presented to his choice. If any of the suggestions I have made or the pleas for research I have put forward should lead chemists to take up any subject connected with our indigenous vegetation, I shall feel rewarded by the thought that the presidential address to the chemistry section has done something to make our organization true to its name—an Association for the Advancement of Science."

Subsequently the following-named papers were read and discussed before the section:

"Variations in the Amount of Ammonia in Waters on Keeping," "On the Internal Structure of Gold Nuggets," "On the Corrosion of Aluminum," and "Contributions to the Bibliography of Gold," by Prof. Archibald Liversidge; "The Refractory Gold Ores of Queensland: Their Sources and Treatment," by E. A. Weinberg; "Pharmacy as a Science and its Future," by W. Finselbach; "Notes and Analyses of Some of the Artesian Waters of New South Wales," by John C. H. Mingaye; "On the Economic Treatment of Gold Ores," by George H. Irvine; "Queensland Native Astringent Medicines," by Joseph Lauferer; "Portland Cement after Fifty Years," by W. M. Doherty; "Some Remarks on the Teaching of Elementary Chemistry," by A. J. Sach; "Analysis of Eucalyptus Gums," by Dr. Wilton Love; "The Ointments of the British Pharmacopœia," by F. W. Simmonds; "Notes on the Poisonous Constituents of *Stephania Hernandezifolia*," by Edward H. Rennie; "Preliminary Notes on the Bark of *Carissa Ovata* *R. Br.* vel *Stolonifera*, *Bail.*," by H. G. Smith; and "On a Method of Shortening Certain Chemical Calculations," by W. A. Hargreaves.

C. Geology and Mineralogy.—Prof. T. W. Edgeworth David, of Sydney University, presided over this section and chose as the subject of his address "Ice Action in Australasia." That portion of his remarks that had to do with the chosen title was preceded by a brief review of some recent geological discoveries. He referred to the fact that in America the Archæan had been shown to consist of four great systems widely

separated from one another in geological time. The reference of the supposed animal solenopora to the calcareous seaweeds was next discussed, and the reference of oolitic limestone to an organic instead of a chemical origin was mentioned. The geological antiquity of man was discussed and British exploration cited to show that man antedated the close of the great Ice Age, and the great Ice Age was thought by most geologists to have passed away from eight thousand to twelve thousand years ago. Turning to Australasia, there was evidence of at least two glaciations on this continent. The first and most intense was in late Palaeozoic time, when the Bowen river coal measures were being formed and the productive coal measures of New South Wales and of the Mersey coal basin in Tasmania. Quite recently attention had been called to the presence of what were probably ice-borne erratics in the Brisbane sandstone. These belonged to a later epoch, and there were evidences of a newer glaciation at Kosciusko and in several high ranges in Victoria. All the evidence so far collected showed that the ice which produced the great glaciations in late Palaeozoic or early Mesozoic time came from the south and moved toward the north.

The following-named papers were then read and discussed before the section:

"Artesian Water in the Western Interior of Queensland," by Robert L. Jack; "Anticlines and Synclines and their Relation to Mining," by Ernest Lilgley; "On the Nomenclature of Crystals," by Archibald Liveridge; "The Development and Progress of Mining and Geology in Queensland," by William Fryar; "On the Present State of our Knowledge of the Older Tertiaries of Southern Australia," by G. B. Pritchard; "The Antiquity of Man in Victoria," by W. H. Ferguson; "The Glacial Deposits of Victoria," by G. Officer, L. Balfour, and E. G. Hogg; "Notes on Tin Mining at Herberton," by John Munday; and "Notes on the Tin Deposits of the Blue Tier, on the Northeast Coast of Tasmania," by Henry Grant.

D. *Biology*.—The presiding officer of this section was Prof. Arthur Dendy, of Canterbury College, Christ Church, N. Z., who chose as the subject of his address "The Cryptozoic Fauna of Australasia." He said: "The term cryptozoic has been applied to that remarkable condition of small animals that are found hidden away in the daytime beneath stones and fallen logs and in other similar situations." The members of this cryptozoic fauna have been derived from nearly all the principal groups of the animal kingdom, and the only character that they all possess in common is their hatred of exposure. He classed this fauna into four sections, distinguished by their mode of origin. They are: 1. Representatives of typically terrestrial groups of animals which are dominant at the present day. It includes many insects, especially ants, beetles, and cockroaches, many spiders, many centipedes and millipedes and many slugs and snails. 2. Surviving members of extremely ancient groups which are now almost extinct. In this section may perhaps be included the scorpions, which are of extreme antiquity. These primitive types appear to have successfully evaded the struggle for existence by taking refuge in obscure retreats. 3. Immature forms of terrestrial animals which are not cryptozoic in the adult condition. This section includes the larvae of various insects

of which the adults live in the open. 4. Isolated representatives of typically aquatic groups of animals which have as yet become but little modified in accordance with their mode of life. Such species appear to be taking the first steps toward a terrestrial life. The introductory remarks were followed by a short review of the knowledge of the principal cryptozoic animals met with in Australasia, considering them in their proper zoological order.

Afterward the following-named papers were read and discussed before the section:

"Dendrolagus or Tree Kangaroo," by Dudley Le Souef; "On the Eating of Earth by the Larger Macropodidae," by J. Douglas Ogilby; "The Marine Mollusca of Tasmania: A Revised List," by Miss Loder; "Observations and Notes on the Genus *Nephila*," by William Joseph Balgore; "The Marine Biology of Houtman's Abrolhos," by W. Saville Kent; "Nests and Eggs of Australian *Aspilota*, or Diurnal Birds of Prey," by A. J. Campbell; "A Short General Account of the Subterranean Crustacea of New Zealand," by Charles Chilton; "Economic Entomology," by Rev. E. H. Thompson; "Metamorphosis of the First Pair of Legs into a Pair of Physiological Feelers in Certain Species of Arachnids," by Joseph Lauterer; "A Synoptical List of Cecidias reported from Australasia and the Pacific Islands up to December, 1894," by W. M. Maskell; "The Migration of Australian Birds," by J. W. Fawcett; "On the Publication of Museum Catalogues of Types," and "On Scientific Book Illustrations," by Charles T. Mumm; "Peculiarities of the Phanerogamic Flora of Queensland," by F. Manson Bailey; "Australian Mosses," by Richard A. Bawden; "Anatomy of *Duboisia Myrsinoides*, *Alstonia Constricta*, and of the Genus *Kraneria*," by W. Fenzlisch; "The Flora of the Clarendon District, S. A., with Notes on Other Local Flora," by J. G. O. Tepper; "A Statistical Account of Australian Fungi," by D. McAlpine; "The Pyrenocarpon of the Lichen Family," by Dr. Jean Mueller; "Pustiferous Fungi," by Dr. M. C. Cooke; "Some Conjugate Algae of Brisbane and Neighborhood," by Robert Griese; "Some Plants peculiar to the Burnett Basin," by James Kaye; "Micro-chemical Researches respecting the Tissues of the Bark of Eucalypts," by Joseph Lauterer; "Useful Plants of the Australian Aborigines," by J. W. Fawcett; "Who discovered the Eucalypts," by G. R. Barten; "The Fertilization of Some Australian Plants," by A. G. Hamilton; and "Myrica Australis," by Mrs. Martin.

E. *Geography*.—The president of this section was Baron Ferdinand von Mueller, who delivered an address on "The Commerce of Australia with Neighboring Countries in Relation to Geography." Among the interesting items of his long address were the following: "Australia comprises, territorially, about one third of the British Empire, and is well adapted for settlement throughout the greater portion of its area. Artesian water will fertilize areas now more or less a desert, and storage of surface water will play its part. The remaining blanks on the Australian map will most probably be filled before the century closes. Mining explorers are penetrating into unknown regions, particularly in the interior of Western Australia. Certain of these are equipped with dromedaries. An ordinary camel team traveled 800 miles from South Australia to Coolgardie without mishap. Brave men are pushing forward to Central Australia from the east. All this portends vastly increased commerce, new gold fields being constantly discovered, calling into being numerous

other industries. Cities of the first rank will arise with marvelous rapidity. Nothing will conduce to this so much as the discovery of gold fields, because the product is immediately available. In Western Australia, where the gold-yielding area seems to stretch through considerably over 1,000 miles from south to north, with a width as yet not even approximately known, the gold deposits are particularly worthy of attention. As civilization extends in Africa a large trade must necessarily spring up. The impending developments in China, Japan, and adjacent islands must not be lost sight of. This will be hastened by the construction of the great Russian transcontinental line from the Ural to the northern boundary of Corea, a distance of about 3,000 miles.

The following-named papers were then read and discussed before the section:

"A West Indian Island," by Sir Henry W. Norman; "A Visit to Tokelau, Union Group," by Rev. Samuel Ella; "Ocean Currents: Bottle Results," by Clement L. Wrangle; "Corea," by Charles Gardiner; "Johore, Malay Peninsula," by Harry Lake; "Matabeleland," by Dr. Jameson; "British East Africa," by Sir T. Fowell Buxton; "Afghanistan," by John A. Gray; "The Upper Mekong, Siam," by H. Warrington Smyth; "The Welsh Colony of the Chupat, Argentina," by Daniel Jones; "The Bissagos Islands," by Paul Armand; "Borneo," by Edmund Lloyd Owen; "Physiography of the Victorian Gold Fields," by James Stirling; "The Himalayan State of Sikkim," by A. W. Paul; "Rotuma and the Rotumana," by Rev. William Allen; and "Campaigns against Arab Slavers in the Congo Free State," by Baron Dhanis.

F. Ethnology and Anthropology.—This section was presided over by Thomas Worsnop, town clerk of Adelaide, whose address dealt with "The Prehistoric Arts of the Aborigines," and was illustrated with 25 lantern views of aboriginal drawings. From these the author argued that all drawings by the aborigines were the result of a self-tutorship and original; that the aborigines arrived in Australia in some remote period destitute of any knowledge of art, and, being fixed to that condition, remained unprogressive to the present day. In all the handiwork of the Australian aboriginal there was an essential originality which distinguished him from all other savage races. He had made the most of his resources, utilizing them all so completely that civilized man was unable to suggest any improvement. They possessed an intimate knowledge of their flora and fauna, and they had also considerable knowledge in anatomy. It should be remembered that art among civilized races was the result of cumulative instruction, and that it was the duty of civilized races to judge leniently of efforts which were quite equal to those of our forefathers at no very remote period. "The art and skill with which some of the figures are drawn, and the great effect which has been produced by such simple means, render it most probable that many of them must have been executed with the intention of exercising an influence upon the fears and the superstitious feelings of the ignorant and barbarous natives. For such a purpose they are indeed well calculated. I have no doubt that were this subject followed up by intelligent explorers and others who may be brought into

contact with examples of native art much profit and great pleasure would be derived from their reproduction and publication. A family likeness marks all of them; the details are everywhere the same. All are imitative, and are the resultant product of untutored taste."

The following papers were then read and discussed in the section:

"The Ancient Government of Samoa," by Rev. Samuel Ella; "Rotumah," by Rev. Thomas Moore; "Errumanga," by Rev. H. A. Robertson; "Notes on Tokelau, Gilbert, and Ellice Islands," by Rev. J. E. Newell; "A Comparative View of Some Samoan Customs" and "Early Samoan Voyages and Settlements," by Rev. J. B. Stairs; "Gaelic Contributions to Folklore," by Rev. A. C. Sutherland; "Foods of the Early Aborigines," by Thomas Petrie; "Boomerang and Woomera: Evolution, Varieties, and Distribution," by Archibald Meston; "Foods of the Northwest Aborigines," by J. Coghlan; "Memories of an Old Explorer," by John Roper; "Outlines of a Grammar of the Turrabul Dialect between Ipswich and Brisbane on the Sandy Country (Yerongpan)," by Joseph Lauterer; "Superstitions of the West African Tribes," by R. O. Garner; "Customs of the Early Clarence River Aboriginists," by John F. Small; "Aboriginal Drawings in the Wollombi Caves," by W. J. Enright and R. H. Matthews; and "Curious Aboriginal Marriage Custom," by E. Thorne.

G. Economic Science and Agriculture.—Prof. Walter Scott, of Sydney University, presided over this section, and the topic of his address was "Fixing a Minimum Wage." He said: "Whether interference with free contract and free competition will yield a balance of good or harm, varies according to circumstances, and each case must be considered on its merits. We are probably all agreed that the wages of some workers as settled by free bargaining are lower than is desirable. Can governments do anything to raise such wages as we may consider too low? In the first place, governments can (and Australian governments do) pay to their own employees in some cases wages above the lowest rate at which they could get the work done. A government that decides to take this course may meet the cost (1) by retrenching other public services, or (2) by additional taxation. In the first case it is the general public that is the loser, being deprived of certain luxuries or conveniences that its government could otherwise have supplied; and the result may be that we shall have on the one hand, say, fewer ornaments on our public buildings, and on the other hand certain government laborers better provided with the means of a satisfactory life. If we prefer this way of spending our public revenue there is no law of political economy to forbid it. If, on the other hand, the government decides to meet the cost by fresh taxation the result will be that certain taxpayers are deprived of some comforts and indulgences, while certain government laborers get more: a change of distribution which may be an improvement. The practice of the government being to accept the lowest tender, the competition of the tenderers forces wages down, and if sweating exist, it is the government that is the sweater. To forbid subcontracting would raise the cost to the public without benefiting the wage earner. Why should not government fix a minimum wage in these contracts also? It is possible and expedient in the general interest to fix a minimum wage in private employment also? That must be done,

if done at all, either by trades unions or by government. If, then, anything is to be done for the class that needs help most, it must be done by government.

The following-named papers were then read and discussed before the section:

"Factory Laws in New Zealand," by Mrs. Grace Neill; "A Living Wage," by Rev. Reginald Stephen; "Primitive Theories of Political Duty," by W. Jethro Brown; "Some Aspects of the Land Question," by John Quick; "The Social Trend: What is Coming?" by Rev. Horace F. Tucker; "Labor: Its Social Rights and Duties," by Rev. J. McInerney; "Some Factors of Federation," by William McMillan; "Land and Finance," by H. L. E. Ruthning; "International Free Trade as affecting Queensland Agronomy," by Daniel Jones; "The Wealth of a Nation as revealed in Australian Finance," by T. P. Lucas; "Labor, the Social Problem of the Hour," by E. F. Scammell; "A Problem in Federation under the Crown: The Representation of the Crown in Commonwealth and State," by R. R. Garran; "Labor and Capital," by A. J. Ogleby; "Three Systems of Political Economy," by Andrew Garvan; "The Torrens Systems of Real Property Law," by J. B. Gregory; "Privy Council Appeals and the Australian Colonies," by G. B. Burton; "The Taxation of Land Values," by H. B. Higgins; "The Vital Processes of National Life," by Sir S. W. Griffith; and "The Socialism of the New Testament," by Rev. Walter Roberts.

The foregoing papers were on political science and the following were on agriculture:

"Soil Analysis" and "Examinations of Different Varieties of Wheat grown in New South Wales," by T. B. Guthrie; "Possibilities of Chilling and Freezing on Australian Agriculture," by Angus Mackay; "Climate Influences on Contagious Diseases of Live Stock," by P. R. Gordon; "Preparation of Meat for Export," by C. T. Abbott; "The Teaching of Agricultural Botany," by Charles T. Musson; "Raisin Drying," by J. L. Thompson; "Our Defenses against Low Prices of Farm Products," by E. M. Shelton; "How to Grow Fruit," by Albert H. Benson; "Floods and Forests," by Philip MacMahon; "Semitropical Horticulture," by Leslie G. Corrie; "The Science of Stock Breeding," by C. C. Mair; "Forage Plants and Grasses of Australia," by Fred. Turner; "The Agricultural Chemistry of the Sugar Cane," by Joseph Fletcher; and "Saving Depreciation of Hides in Branding," by Alexander Bruce.

II. Engineering and Architecture.—This section was presided over by James Fincham, Engineer-in-chief of Tasmania, who discussed the topics of "Architecture and Engineering" in his address. He said: "The ablest works of the old architects or 'chief builders' are always found in the expression of a high ideal of service in worship, and the modern engineer with a proper appreciation of his work may claim a similar high ideal of service when he removes dangerous rocks from the course of our ships, builds out massive arms of protection for the shelter of life or property from the attacks of the sea in its wild rages, links people to people by the daring bridge or the skillfully burrowed tunnel, and fights disease and suffering with water and sanitary schemes. As prominent among the numerous items in engineering progress we may note the large ship-canal schemes, the problem of rapid transit in large cities, and the ever-increasing boldness in bridge designs, the latest of which, involving the support of 6 lines of railway in a span exceeding 3,100 feet, has been formally approved and certified by a board of the ablest en-

gineers in America. The magnitude of our engineering and architectural public works in Australasia can be fairly gauged from the expenditure upon them of some £200,000,000, out of which £120,000,000 have been spent upon railways, and I make bold to say that a large portion of this latter sum has been prematurely expended in the case of numerous lines through districts with requirements that have been amply served by one or at most two trains a day. The extended construction of new lines to meet the needs of growing populations can not be long delayed, and the construction of good pioneer and feeder lines at a much lower normal cost therefore becomes a question of considerable importance. Because mistakes have been made in the past by constructing as 'light lines' railways that soon became quasi main lines, unequal to the strain of traffic, or because, from some public or political influence, a line that would have served all really useful requirements is ruined by being worked under conditions for which it was never designed, in order to serve a small unproductive passenger traffic.

Subsequently the following-named papers were read and discussed by the section:

"Experiments on the Waterproofing of Bricks and Sandstones with Oil" and "Experiments on the Porosity of Plasters and Concretes," by Prof. A. Liversidge; "Wind Pressure," by Prof. W. C. Kennot; "Architectural Sculpture," by Percy F. Hockings; "Diversion of Flood Waters," by John Rogers; "Domestic Architecture in Semitropical Climates," by J. H. M. Addison; "On Torpedo-resisting Elevator Structures," by Thomas Parker; "A few Notes on the River Fitzroy, Central Queensland," by Thomas Parker; "Descriptive Architecture and Art," by Leslie G. Cowie; and "Earthquakes in Relation to Building Construction," by Thomas Turnbull.

1. Sanitary Science and Hygiene.—This section was presided over by Dr. J. W. Springthorpe, who delivered an address on "the Interrelations of Science and Health." He said that on matters of health, as upon all matters of human interest, three voices had during the ages claimed to speak to man with more or less authority—the voice of the priest, the voice of the philosopher, and the voice of the scientist. Each in turn had dominated the rest, none had ever become perfectly silent, and all had possessed a distinct value. A striking characteristic of modern times had been the rise and crowning of the third adviser, Science—the science that worked through accurate observation, exact experiment, and logical deduction therefrom. Health must, in the first place, be very largely a matter of inheritance. Man, like other organisms, was started upon the way of life with all possibilities conditioned by inherited molecular potentialities, and science would shut its eyes to omnipotent law if it did not recognize the fundamental influence of appropriate marriage upon the health of the offspring. An incalculable amount of disease would be averted and a corresponding amount of health secured if only inheritance could be scientifically regulated. Inheritance, however, did not explain all life, much less all health. Both were also questions of development and environment. It was a commonplace to remind any one how largely health depended upon, for example, such everyday matters as food and drink, exercise, recrea-

tion and rest, and attention to the different functions. Yet how widespread did they find ignorance and neglect in these very points, and how very disastrous were the results that followed therefrom! These separate matters were considered in turn. And in conclusion, he said that the sanitary millennium lay before and not behind them, and that all succeeding years would witness a continuous, if gradual, decrease in the amount and degree of disease.

The following papers were then read and discussed before the section:

"Recent Sanitary Progress in South Australia," by Thomas Hottelwick; "Leprosy," by Alexander Francis; "The Climate of Australia in Relation to Phthisis," by Duncan Turner; "The Sanitation of Country Towns," by James J. McDonnell; "The Effect of the Queensland Government Educational Regulations upon the Physique of the Present and Future North Queenslanders," by Joseph Ahearne; "The Hygiene of Dress, with Special Reference to Queensland," by Lillian Cooper; "The Distributed Center System of Mechanical Sewage Transmission," by Robert Wilson; "Further Notes on Spiroptera and Tuberculosis in Cattle," by C. E. Bernard and Archibald Parkes; "Remarks on Modern Etiological Views of the Maintenance of Leprosy" and "A Review of the Sanitary State of New South Wales in 1894," by J. Ashborton Thompson; "An Inquiry into the Principles of the Treatment of Inebriety and Kindred Conditions," by Patrick Smith; "The Promise of Serum Therapeutics in regard to Tuberculosis," by J. Sidney Hunt; "A Sanitarium for Consumptive Patients in Queensland," by Eugen Hirschfeld; "The Prevalence and Intercommunicability of Human and Animal Tuberculosis," by S. S. Cameron; "Contagiousness of Tuberculosis," by F. H. Vivian Voss; "Compulsory Notification of Infectious Diseases," by Wilton Love; "Leprosy," by C. E. Dumbleton; "Federal Quarantine," by K. J. O'Doherty; and "Notes on Phthisis," by George L. Mullins.

J. Mental Science and Education.—The presiding officer of this section was Prof. Francis Anderson, of Sydney University, whose address was on "Politics and Education." After discussing his subject generally he said in the United States there had been founded in the large cities and in connection with many of the larger universities schools of political science, and he did not see why they could not be established in Australia, not only in towns which had their universities, but in places like Brisbane, which were not the proud possessors of a university. In the American schools of political science it was possible to obtain information with regard to many of the political problems in Australia with greater ease than it could be obtained in Australia itself. The publications which were issued under the auspices of these schools had not only supplied our education in the American States to students, lawyers, business men, and others, but they supplied about the only political education obtained by Australian students, lawyers, and business men. In Australia it was to the organizations such as the schools that they must look—in addition to the work of the press—for the training and education of the body of opinion which was to such a large extent wanting here. We had no training for journalists beyond that which they might pick up by actual experience. We had training for lawyers, but they might be better if they had a training which went beyond the special training they now received. Further,

there were the civil servants. Now, for all they could see, the civil service of Australia, great as it now is, might even become a much larger body. But supposing the Government should extend its operations much beyond its present limits, where were we to look for a body of trained civil servants? If we succeeded in working a land act we knew we did so after a succession of blunders, and, if merely to supply a training and education which might benefit the public servants and the citizens, the establishment of schools of political science would be an experiment well worth trying, perhaps a better experiment than 50 or 100 others that we have already tried.

Subsequently the following named papers were read by their authors and were discussed before the section:

"Science as a Subject in Girl's Schools," by Miss F. E. Hunt; "The Training of Teachers," by Miss Helen E. Downs; "The Development of English Comedy: An Example of Literary Evolution," by W. H. Williams; "The University and the State," by Canon F. Slaney Poole; "The Tendencies of Australian Literature," by Ernest Favenc; "On the Teaching of Languages," by Charles H. Barton; "Walt Whitman," by William Gay; "Some Methods of Studying Languages," by George W. Power; "The Curriculum of Secondary Education," by D. H. Hollidge; "Education of Girls," by Mrs. M. S. Wolstenholme; "Architecture in Relation to Education," by George H. M. Addison; "The Technical Element in a State System of Education," by Anthony St. Ledger; "The Poetry of Robert Buchanan," by W. Edward Graham; "The Music of Speech," by John H. Nicholson; "State Instruction in Drawing" and "Australian Art Development," by John Plummer; "A Contribution toward the Study of the Relation of Ethics and Science," by Rev. J. S. Pollock; "The Tendencies of Australian Literature," by John B. O'Hara; "The Tendencies of Australian Literature," by Sydney Jephcott; "Use and Abuse of Examinations," by Henry Belcher; "The Importance of Mental Science as a Guide in Primary Education," by James Rule; "Religious Instruction in Day Schools," by A. R. Rivers; "Art Education," by R. Godfrey Rivers; "The Educational Chasm, and how to Bridge it," by H. Cecil Wright; "The Schoolmaster of the Future," by Thomas Bradbury; "The White Vedette," by Mrs. Thomas Wade Foot; "To Science," by George E. Evans; and "A Glance at the Art of Sculpture," by J. R. Trantham-Fryar.

Next Meeting.—At a meeting of the General Council held on Jan. 18, it was resolved that the next meeting of the Association be held in Sydney two years hence, also that the meeting next after the Sydney meeting be held at the Melbourne University. The new president chosen is Prof. Archibald Liversidge, of Sydney.

ASTRONOMY, PROGRESS OF, IN 1895.

Though, like the year immediately preceding it, 1895 was not remarkable for any startling astronomical disclosures, save the interesting discovery of the components of the rings of Saturn, yet our knowledge of the visible celestial universe has surely though slowly advanced.

The Solar System.—Since the completion of last year's record the boundaries of the solar system have not been enlarged, nor has its membership been increased, except by the addition of a few asteroids and two short-period comets, and, as no change has been made in the assumed solar parallax, the volumes and distances of its several constituent bodies, both primary and secondary, remain mostly unchanged.

The Sun.—The efforts of several astronomers, notably those of Dr. Common, of England, and of M. Deslandres, of France, and of Prof. G. E. Hale, of the Kenwood Observatory of Chicago, to photograph the solar corona without an eclipse have resulted thus far only in failure. And, though this idea has not been entirely abandoned, yet there is so little promise of success that an attempt to perform this difficult task by other means is being made, but, owing to the difficulties attaching to this problem, its solution seems well-nigh hopeless. At the present the corona can be observed only when the Sun is totally eclipsed, hence, the time for its study amounts to but a few minutes in a century. Considering this fact, the importance of the ability to photograph the corona of the uneclipsed Sun is self-evident.

Wonderful Solar Prominences.—In the "Astronomical Journal," August, 1895, Prof. J. B. Coit writes of a prominence observed by him on June 11, 1895, whose phenomena was on a scale of magnitude and brilliance seldom observed. He says: "At 2^h 17^m, Washington mean time, with the slit of the spectroscope tangential to the Sun's limb, at position angle 243°, a brilliant prominence was discovered resting upon the Sun, having a broad base and widened out at the top. Upon the western side a streamer reached down to the chromosphere and extended upon it some 15". The top of the formation was quite regular, there being no spikes nor sharp tongues of flame. The height was 74' = 33,300 miles. At 2^h 49^m a small, detached cloud was seen floating above the main portion. The ascent of the prominence was gradual. At 3^h 19^m 28^s it had reached to the extraordinary height of 289" = 130,050 miles, a length great enough to five and one half times enwrap the Earth. At 3^h 7^m the ascending column was resolved into detached clouds, the upper one at the enormous height just mentioned.

A prominence of far greater magnitude than that just described, attaining to a greater height than any ever observed, was seen and measured by Father Fenyé, of the Haynald Observatory, Hungary, on Dec. 24, 1894. The maximum velocity of the uprush was nearly 280 miles per second, and, though the prominence reached to the prodigious height of 11' 1" or 297,450 miles, the whole outburst was at an end in three hours. The origin of a force so enormous must lie beneath the chromosphere in the Sun itself.

Temperature of the Sun.—M. M. Wilson and Gray, of the Daromona Observatory, as a result of experiments on the temperature of the carbons of the electric arc, find it necessary to make correction to the hitherto assumed temperature of the Sun, increasing it from 13,352° F. to 14,432° F.

Transit of Mercury.—The transit of Mercury across the disk of the Sun, on Nov. 10, 1894, was visible throughout the Western Continent and the western portion of the Eastern Continent, and where the sky permitted was generally observed. At the Lowe Observatory, Echo mountain, California, the phenomenon was observed in its entirety, as also at the Lick Observatory, Mount Hamilton, California. The transit began about one minute later than the computed time, which delay was noted in Eng-

land also and elsewhere. At the Lowe Observatory no halo encircling the planet was detected, though carefully looked for by the observers, but a starlike point gleamed from the center of its disk several times. This appearance was noted at the Davidson Observatory, San Francisco, also, though not seen by the observers on Mount Hamilton. This central spark of light has been a subject of dispute, some observers averring they had seen it, while its existence has as often been denied by others.

Diameter of Mercury.—On Nov. 10, 1894, during the transit, Dr. Barnard, of the Lick Observatory, succeeded in obtaining an elaborate series of measures of the angular diameter of the planet's disk while transiting the Sun, which will involve a revision of the dimensions adopted by Leverrier in his tables now used in the "Nautical Almanac." Reduced to distance unity, they become equatorial diameter 6.241", and polar diameter 6.178". The weighted mean, depending on the work of 19 different observers extending over a period of fifty-eight years, was 6.415". Leverrier's value was 6.65" at the mean distance of the Earth from the Sun. From the mean of Barnard's measures—i. e., from 6.210"—the linear diameter of Mercury is 2,781½ miles.

Rotation of Mercury.—The theory advocated by Schiaparelli, that the rotation of Mercury on his axis is synchronous with his revolution around the Sun, does not meet with acceptance by astronomers, particularly by those who have made special study of the planet. The generally received opinion is that his rotation period differs but little from those of the inner group of major planets, viz., the Earth and Mars, and from the assumed period of Venus.

Mass of Mercury.—M. Backlund's recent researches on Mercury's mass and the acceleration of the mean movement of Encke's comet are described by M. Callandreau in "Comptes Rendus" of Oct. 1, 1894. Encke's comet has particular interest not only on account of the diminution of its period of revolution (about two and one half hours from one apparition to the next), but also from the fact that its motion is disturbed by Mercury. A discussion of the 7 apparitions of the comet between the years 1871 and 1891 has led M. Backlund to the conclusion that Mercury has a much smaller mass than has hitherto been ascribed to him. The value deduced is (the Sun equaling 1) mass of Mercury = $\frac{1}{177,000}$; hence, nearly 9,700,000 bodies like Mercury would be required to equal the mass or weight of the Sun.

Rotation of Venus.—Important investigations of the period of rotation of Venus have been made by a number of astronomers, among them M. Camille Flammarion, the French astronomer, whose study has extended through a period of eight years, and have resulted in the refutation of the hypothesis that this planet, like our Moon, completes a rotation on her axis simultaneously with her revolution around the Sun, viz., in 24^h 16^m. Late determinations make her rotary period not greatly different from twenty-four hours.

Spectrum of Mars.—Dr. Huggins has recently made some observations of the spectrum of Mars which fully confirm those made by him nearly thirty years ago. These, though difficult

and delicate, showed that, undoubtedly, the atmosphere of Mars was heavily laden with water vapor, for certain bands were seen which corresponded with the bands of water vapor found on the Earth in the spectra of the rising and setting Sun. By a comparison of the spectrum of Mars with that of the Moon, the latter being at a lower altitude than the former, Dr. Huggins proved that these bands were not due to the influence of our own atmosphere. Seeing that we are looking at Mars from a zenithal position, and that the telluric bands of the Earth's atmosphere could be seen only with the Sun at a very low altitude, even the slightest indication of the presence of water vapor in the spectrum of Mars was proof positive of its existence in his atmosphere in considerable quantity.

Inner Satellite of Mars.—Observations of this satellite (Phobos), made by Prof. W. W. Campbell, of the Lick Observatory, between Oct. 25 and Nov. 15, 1894, show that its eastern elongation occurs at a considerably greater distance from the planet than does the western elongation. Prof. Hall's studies at the time of discovery of these satellites of Mars plainly evinced that the western elongation of Phobos was then noticeably greater than its eastern. This variation can be accounted for only by the revolution of the orbit itself.

Polar Regions of Mars.—Between the years 1781 and 1783 Sir William Herschel noticed that the polar snow caps of Mars waxed and waned with the Martian seasons, increasing as the winter advanced, and diminishing with the progress of summer, but, until October, 1894, they have never been known to entirely disappear. Sir William found that while the north cap had its center exactly at the north pole of the planet, that of the southern cap was 6 or 8 degrees from its south pole; hence, when the southern ice cap is very small, which is always the case during summer in the southern hemisphere, it does not centrally cover the pole, but lies to one side of it. During the opposition of Mars in 1894 the white cap was seen very irregular in form, then portions became detached from the main body, and, later, all melted away and disappeared. Prof. Campbell, of the Lick Observatory, who has been a student of Mars, says that on July 19, 1882, an intensely white spot was seen partly detached from the main cap, but projecting beyond it. When, two years later, on July 10, 1894, it was observed the southern summer of Mars was more advanced, the cap, grown smaller, had left the white spot behind, detaching itself entirely by Aug. 15, and disappearing from view a little later. As there are four of these spots at the edge of the cap where the melting of the snow was retarded, both in 1892 and 1894, Prof. Campbell concluded that they are the snow-covered tops of high mountains, on which, of course, the snow would melt and disappear later than at lower altitudes.

Atmosphere of Mars.—Prof. Campbell doubts the existence of an atmosphere on Mars, but the revelations of the spectroscope in the hands of other and equally efficient observers are opposed to him regarding this particular.

Jupiter.—For the ascertainment of his size, his rotational period, the nature and cause of his belts and white and dark spots, the reason of the

dark transits of some of his satellites, and of their sometimes "square-shouldered" appearance and, again, their duplex seeming, like a double star, much study has been evoked; but while some of the mysteries of the giant planet have been solved, yet many secrets are still locked in this massive world.

In the account of his measures of the diameter of Jupiter, Dr. Barnard calls marked attention to the discrepancy between those made by the aid of the filar micrometer and those of the heliometer, the former giving a diameter about 1' greater than the latter. This he attributes to the defective images formed by the divided halves of the object glass, and hence he concludes that for planetary diametrical measurements the heliometer is a defective instrument. The mean of all his measures gives (at distance 5.20, the Earth's distance being taken as unity) $90,190 \pm 56$ miles as the equatorial diameter, and $84,570 \pm 75$ miles as the polar diameter, the polar compression being $\frac{1}{100}$.

Mass of Jupiter.—"Astronomische Nachrichten," No. 3249, has an article by Prof. Simon Newcomb which embodies much valuable information on this subject. He says: "The following table shows the values and the relative weights to which I have judged each one entitled. I do not deem it necessary at the present time to give in all detail the considerations which led to the adoption of these weights. I may remark, however, that Von Haerdtl's excellent result from the perturbations of Winnecke's comet, which has by far the smallest probable error of any determination yet made, has not been assigned a corresponding weight because of a distrust on my part whether observations on a comet can be considered as having always been made in the center of gravity of a well-defined mass moving as if its center were a material point subject to the gravitation of the Sun and planets. This distrust seems to me to be amply justified by our general experience of the failure of comets to move in exact accordance with their ephemerides. The mass of Jupiter, from all observations on the satellites,

Action of Fay's comet	= 1047.82, weight = 1.
" " asteroid Themis	= 1047.79, " = 1.
" " on Saturn	= 1047.54, " = 5.
" " asteroid Polyhymnia	= 1047.88, " = 7.
" " Winnecke's comet	= 1047.84, " = 20.
Weighted mean	= 1047.17, " = 10.

Jupiter's Third Satellite.—As a test of the correctness of Prof. W. H. Pickering's theory of the elongation of the disk of the third satellite of Jupiter, Dr. Barnard, with the 36-inch telescope of the Lick Observatory, has subjected this Moon to a rigid examination, with the result that, with all powers up to 1,000 diameters, the satellite remained perfectly round, even when the eye was put into different position angles. The usual markings were seen, but no distortion of the disk was observed at any time, with any power, and under the best conditions of seeing.

Dark Transit of Satellite III.—On Feb. 8, 1895, as observed at Greenwich, this satellite passed on to the disk of the planet at 7^h 3^m. At 7^h 30^m it was invisible. At 8^h, and until about a half hour before egress, it was seen as a dark,

circular spot. This is a frequently observed phenomenon, but the cause of its blackness, even in direct sunshine, is a profound mystery.

Orbit of the Fifth Satellite of Jupiter.—M. Tisserand reports the results of his researches on the orbit of the minute satellite of Jupiter, discovered Sept. 9, 1892, by Dr. Barnard, of the Lick Observatory. In his investigations he has used a circular orbit, a fixed elliptic orbit, and a variable elliptic orbit, the last method giving greatest satisfaction. The eccentricity of the orbit is very small, equaling about 0.01, making the ellipse almost a circle. Owing to the equatorial protuberance of Jupiter, the major axis makes a complete revolution in the astonishingly short period of five months.

Diameter of the Satellites of Jupiter.—These satellites have been subjected to filar micrometer measures by Dr. Barnard, using the 36-inch glass with a power of 1,000. Unless the night were exquisite enough to permit the employment of this power and give distinctly defined disks, no measures were attempted. In every case the measurements were made by the method of double distances, 3 to 4 settings both before and after the reversal of the wires being employed. The great power and the large scale of the 36-inch equatorial render it very suitable for the determination of very small quantities, as, for instance, the diameters of the larger asteroids, the satellites of Jupiter, etc., always using the full aperture of the telescope:

Satellite I	= 1.048" = 2,450 miles.	8 nights.
" II	= 0.774" = 2,045 "	8 "
" III	= 1.221" = 3,056 "	10 "
" IV	= 1.430" = 3,545 "	9 "

The "Red Spot" of Jupiter.—Between November, 1894, and March, 1895, as observed at Greenwich, this object was carefully examined whenever visible. It was never easily or distinctly seen. No color was noticed in it, it being simply an elliptical outline. Best views of it were usually had before and after it had passed the central meridian.

Saturn.—In 1894, during the opposition of Saturn, Dr. Barnard made a long series of observations, extending from February to July, with the 36-inch refractor of the Lick Observatory, of this planet, its rings, and its satellites. They confirm in a remarkable degree the prior measures of Prof. Asaph Hall with the 26-inch refractor of the Naval Observatory, Washington, D. C., from 1884 to 1887. These harmonizing observations of the two astronomers would indicate that no change has occurred in the Saturnian system since the first systematic measures were taken, and negative the assertion once made by a distinguished astronomer, that the rings were approaching the planet and would, in a few years, coalesce with it. One conclusion arrived at was that, contrary to some former assertion, the center of the planet was in the optical center of the ring.

The black and white spots alleged to have been seen on the planet by small telescopes were never found either with the 12-inch or the 36-inch telescope, though carefully sought for, and he is confident they do not exist. The outer edge of the inner crape ring appeared to unite with the inner edge of the middle bright ring. No spots or markings of any sort were seen on

the crape ring, nor was its inner edge serrated, as some users of small instruments have claimed.

The following are the micrometrical equatorial measurements of the planet, the result of twelve nights of observation, from March 25 to June 25, 1894, reduced to mean distance, equaling 9538861, Earth's distance = 100. Corrected for phase:

Equatorial diameter in arc	= 17.744" = 74,156 miles.
Polar	= 16.907" = 69,906 "
Polar compression	= 6 170 miles,

or, in simplicity, 6,170 miles shorter in diameter from pole to pole than through his equator, while the Earth's polar axis is but 26½ miles shorter than its equatorial diameter.

Saturn's Rings.—The announcement by Prof. J. M. Keeler, of Allegheny Observatory, Pennsylvania, that by the spectroscope he had obtained proof positive that the rings of Saturn are composed of countless millions of minute satellites (a fact long suspected) has awakened renewed and widespread interest in the unique system of this wonderful world. When it became known that its rings were multiple, then arose the question of what are they constituted, and are they solid or liquid, or formed of discrete particles, analogous to the tails of comets or the rings of meteors which surround the Sun? The theory held by many astronomers was that, if solid, they could not remain intact, as the great centrifugal force experienced would tear them asunder, even if of the strength of steel. This spectroscopic evidence, which is indisputable, that they are neither gaseous, liquid, nor solid, must put to rest all speculation, Prof. Keeler having demonstrated the correctness of the conclusions previously reached by many astronomers.

If the spectroscope be pointed to the Sun's center, which has no motion to or from us in the line of sight, the lines will occupy the same positions as those produced in the chemist's laboratory by raising to incandescence the substances producing the solar lines. When, however, it is aimed, say, at the upper limb of the Sun, which by his rotation is approaching us, the lines are moved toward the violet end of the spectrum, but if, on the other hand, it be directed to the Sun's lower limb, which is moving from us, the same lines are deflected toward the red end of the spectrum. Now, if the ring of Saturn be a solid, the outer edge, being larger than the inner, should move the faster, but if it be composed of minute satellites the inner ones, being nearer the planet, will move more swiftly, for the same reason that Mercury's orbital motion is faster than that of Venus, and that of Venus faster than that of the Earth, etc. This simple reasoning explains the nature of Prof. Keeler's discovery, which is, that the inner edge of the ring moves faster than its outer. By well-known spectroscopic processes Prof. Keeler has ascertained that the inner edge must move at the rate of 13.06 miles per second, and its outer edge 10.65 miles.

During the same opposition of Saturn in which Prof. Keeler achieved his wonderful discovery Dr. Barnard made a prolonged series of micrometrical measurements, of which the annexed table is the result:

Outer diameter of outer ring,	40°24' = 172,780 miles.
Inner " " " "	34°44' = 149,630 "
Outer " " middle ring,	38°14' = 144,880 "
Inner " " " "	35°07' = 139,530 "
Outer " " " "	31°03' = 90,360 "
Width of division between outer and middle ring, 4°55'	= 2,395 "

These measures agree so closely with those of Prof. Hall in the years 1884 and 1887 as to inspire much confidence in their accuracy.

The division or space between the outer and middle ring is, from its discoverer, called the Cassini division. The outer ring has occasionally been seen to be divided also, and this separation has been named the Encke division.

Diameter of Titan.—This, the largest of Saturn's satellites, is the only one of his 8 moons which can be subjected to successful micrometrical measurement. Dr. Barnard has given much time to this object, but it seldom happened that the atmosphere was sufficiently steady for it to present a well-defined disk, without which, of course, no measures could be made. When the disk was observable a magnifying power of 1,000 diameters was used, and the subjoined result obtained, it being the mean of the observations of the year 1894, on May 6 and 7, June 18 and 25, and July 2: Diameter, = 0°40' = 2,523 miles. This is a smaller diameter than that usually assigned to Titan, and indicates a density about 5·2 times as great as that of its primary, Saturn's density being equal only to that of ordinary pine wood.

Diameter of Neptune.—In the "Astronomical Journal" (April 9, 1895), Dr. Barnard writes of the diameter of this, the most distant known planet, and of his employment upon it of the 36-inch telescope with, generally, a power of 520, though on one or two occasions using a power of 1,000 diameters. Save in a single case the disk always appeared round, while in the observations of Uranus the disk was ever decidedly elliptical. Following are the results of the work of ten nights reduced to the mean distance from the sun = 30·0551, in terms of the Earth's mean distance = 1:

Diameter in arc	= 2·438''
Diameter in miles	= 32,900

Asteroids.—The exact number of these small planets lying between Mars and Jupiter is not known, but, excluding those only once seen, and therefore without calculated orbits, it is not far from 404. Twenty-one have been found since last year's report, as follows:

898 BA	Mar. 7, 1894	Charlois.
899 BB	" 8, "	"
899 BC	" 24, "	Rigordan.
899 BD	Nov. 1, "	Wolf (orbit unknown).
899 BE	" 1, "	Wolf.
899 BF	" 4, "	"
899 BG	" 4, "	"
899 BH	" 12, "	Borelly.
899 BK	" 20, "	Charlois.
899 BL	Dec. 1, "	"
899 BM	" 19, "	"
899 BN	" 28, "	"
899 BO	Apr. 9, 1895	Roberts (orbit unknown).
899 BP	Feb. 28, "	Wolf.
899 BQ	" 29, "	Wolf (orbit unknown).
899 BR	Mar. 16, "	Charlois.
899 BT	" 15, "	Wolf.
899 BW	" 21, "	Charlois.
899 BX	May 18, "	"
899 BY	July 23, "	"
899 CA	" 23, "	"
899 CB	Aug. 22, "	"

Since the last record names have been given to

818	Magdalena.	844 = M	Desiderata.
819	Leona.	869 = AE	Eria.
881	Etheridgeia.	884 = AV	Burdigala.
884 = L	Chicago.	892 = BF	Wilhelmini.
886 = D	Lacadicera.	401 = BT	Ottilla.

Over one hundred of these tiny planets are nameless.

The planet BE has an interesting orbit, and, in contrast to nearly all the others, may prove of some practical value to astronomers. With the possible exception of 323 (Brucia), its perihelion distance is the smallest of the entire family, being but 1·60. Its least distance from the orbit of Mars is only 21,000,000 miles, and from that of the Earth but 63,000,000. It is therefore well adapted for the determination of the solar parallax, as when in opposition and on the meridian at midnight, being in the telescope but a minute point, it is of far greater accuracy for the ascertainment of the Sun's distance than a transit of Venus.

Encke's Comet, with a period of only 3·3 years, was detected by M. Perrotin on Nov. 1, 1894, at the Nice Observatory, France. This is the most interesting of all the short-period comets, not only because its time of revolution is the shortest, but because of its near approach to the planet Mercury, thus affording the most reliable data known for determining the mass of that planet. In 1891 it came quite near the planet, and gave opportunity for a long series of observations, from which the most trustworthy value for Mercury's mass ever assigned was deduced. Its periodic time at each return is found diminished by about two and a half hours, which fact has caused much speculation and wonder, and is yet an unsolved problem. The theory regarding this retardation which has most adherents is that it is caused by the resistance of the hypothetical, all-pervading ether, and this retardation of its motion shortens its periodic time.

Comet IV 1894 was discovered on Nov. 20 by Edward D. Swift, assistant astronomer at the Lowe Observatory, Echo Mountain, California. It was detected with a 16-inch refractor, and, having passed perihelion, was an exceedingly faint object. A very faint, short tail was perceptible. A computation of its orbit from three positions showed it to be not only an elliptic comet of short period, but, also, that its elements were almost identical with the lost comet of De Vico, discovered in 1844, with a computed period of about five and a half years, which had not again been seen until this finding by Swift. Though possible, it is exceedingly improbable that two comets should possess nearly the same elements, and astronomers are agreed that this new comet is a return of De Vico's to perihelion, which must have happened nine times without detection.

The observations and measurements of this comet by Dr. Barnard, who followed it with the great telescope until Jan. 29, 1895, were of great value in computing a more exact set of elements.

From all observations, Dr. Chandler, of Cambridge, Mass., has computed the following elliptic elements, and for comparison the elements of De Vico's comet, by Brunow, are given:

COMET (c) SWIFT.

Perihelion passage, 1894, Oct. 13-18917, Greenwich mean time.	
Node to perihelion	= $294^{\circ} 51' 35.3''$
Longitude of node	= $49^{\circ} 44' 37.1''$
Inclination	= $3^{\circ} 57' 58.9''$
Log. of perihelion distance	= 0.1436434
Eccentricity	= 0.071495
Period	= 0.6623 years = 241.4 days.

DE VICO'S COMET.

Perihelion passage, 1844, Sept. 2-484.	
Longitude of perihelion	= $541^{\circ} 30' 48''$
Longitude of node	= $63^{\circ} 49' 35''$
Inclination	= $2^{\circ} 54' 46''$
Perihelion distance	= 1.18879
Eccentricity	= 0.61787

In comparing these elements, which agree quite closely, the greatest difference will be found in longitude of node and perihelion distance. Notwithstanding the slight apparent difference of orbit, the following diagram will show their agreement, and that the comet is identical with that of De Vico is almost without doubt. If this be so, then the latter comet during the fifty years it was lost must have been subjected to some greatly perturbing influence besides the Sun, which could not have been other than that of the giant planet Jupiter, near which it passed in 1885, when the approach was so close (see diagram) that both objects, for two years not only moved in the same direction, but also in nearly parallel paths. This long-continued attractive power of Jupiter was sufficient to change the orbit of De Vico's comet into that of Comet Swift.

An inspection of the drawing will show that the long-lost comet's orbit runs also close to that of the planet Mars, and that in the distant future, when the comet itself shall travel thither, it must encounter another disturbing force and be again diverted into a new orbit. Its next near approach to Jupiter will occur in 1897, when it must again be greatly perturbed or, perchance, again lost.

Brorsen's Comet.—This periodic comet, which was discovered in 1846 and has a period of 5.8 years, is now due, but, because of its proximity to the Sun, it has not yet been detected, and very probably it may not be seen at all. As it was not found at its last apparition, though it was favorably situated for visibility, it may have shared the fate of the disintegrated comet of Biela.

Comet 1894 II (Barnard).—This comet, whose period—five and a half years—is just expiring, has not of a surety been detected, though sought for with great assiduity, particularly at the Lick and Lowe Observatories. At its return in 1890, as was expected, it eluded observation also. On the morning of June 30, Dr. Swift, of the Lowe Observatory, observed not very far from the comet's ephemeris place a very faint cometary-looking object which he took for a nebula, as Sir William Herschel had several near. Returning to it on July 4, he found the body missing, and came to the conclusion that it was the much desired Barnard comet of which he had had a view, but which long-continued effort failed to refind. Owing

ORBITS OF VICO'S AND SWIFT'S COMETS.

to the position of its orbit the comet can not be again seen until 1906, its detection in 1901 being improbable. The approximate place of the suspected comet on June 30 was right ascension $1^h 20^m 45^s$; declination north $2^{\circ} 55'$.

Comet 1895 a (Swift).—On the morning of Aug. 20, Dr. Lewis Swift, Director of the Lowe Observatory, discovered a very faint but rather large comet in right ascension $0^h 27^m 40^s$; declination north $5^{\circ} 30'$. It had a very slow motion in a northeasterly direction. Following are its elements computed by Prof. Lewis Boss:

Time of perihelion	= T = Aug. 30 75496
Longitude of perihelion	= ϖ = $335^{\circ} 50' 1''$
Longitude of node	= Ω = $170^{\circ} 19' 09''$
Inclination	= i = $11^{\circ} 11' 1''$
Eccentricity	= e = 0.630608
Mean daily motion	= n = $491.509''$
Semimajor axis	= a = 3.3849
Period	= 7.23 years.

Dr. Herberich's determination of its period is 7.06 years. This comet proves to be another of the Jupiter family of comets, which now numbers 20. They are so called because of the change of original orbit by the attraction of that great planet's mass as they journeyed to the Sun. Save Halley's, all the known periodic comets move direct, and all but that one belong to the Jupiter group.

Fay's Periodic Comet.—This comet was detected on Sept. 26, 1895, at the observatory of Nice, France, in right ascension $21^h 8^m 11.5^s$; declination south $1^{\circ} 54' 11''$. Though it has passed the point nearest to the Earth, it will not arrive at perihelion until March, 1896, and therefore it ought, in strictness, to be included in the list of comets of that year.

Total Eclipses of the Moon.—On March 10, 1895, there occurred a total eclipse of the Moon visible from both continents. During the various stages of its progress it exhibited phenomena of great interest. In coloration, the density of the shadow, and the semiobscuration of the Moon during totality it bore a great resemblance to its last return, also total, in 1877. Several attempts to photograph—with both short and long exposures—the Moon during the total phase, proved abortive. One exposure of an entire minute photographed only one faint, neighboring star. One conspicuous feature of the eclipse was the extraordinary brightness of Aristarchus, for which its general high albedo seemed hardly to account.

Eclipse of Sept. 3 and 4, 1895.—This total eclipse of the Moon was a return of that of Aug. 23, 1877. In general appearance to the naked eye it was very similar to that of March 10, 1895, but with the telescope several marked differences were observable. Aristarchus, which then glowed like a diamond, attracting universal attention, was very faint and inconspicuous. At the Lowe Observatory, a phenomenon never before observed by the writer—but visible to many on this occasion—was seen; the upper portion of the Moon was of a pale but decided blue color, its upper boundary convex, agreeing exactly with the convex arc of the Moon's limb, and the chord perfectly straight—not concave like the new Moon's narrow crescent. The length of the versed sine was about $\frac{1}{4}$ of the Moon's diameter. This feature was nicely observable with field and opera glass and with the $\frac{3}{4}$ -inch finder of the telescope, but was less distinct, though easily seen, in the great telescope itself.

The chief value to astronomy of a total lunar eclipse is the determination of the times of occultation of stars by the lunar disk during totality. Both limbs of the Moon being then similarly illuminated, by observation of disappearances and reappearances of stars occulted the ascertainment of the Moon's diameter freed from the effects of irradiation is made possible. Also, from diminution of the Moon's light, much fainter stars may then be seen near the disk than

at other times. At Greenwich Observatory 137 observations of disappearances or reappearances were recorded by the eleven observers who watched the progress of the eclipse. Of this number of observations 124 were pronounced good. In observing an occultation, the time could be estimated to about the tenth of a second.

The ruddiness of the Moon when totally immersed in the Earth's shadow can, of course, be understood, but no satisfactory reason has yet been given for the great variation in color and brilliancy in different eclipses. Even when happening under similar circumstances, there is still wide difference in the amount of luminosity of the eclipsed Moon.

The faintness of the Moon during totality is much underrated. Prof. W. W. Pickering, in the total eclipse of 1887, estimated the eclipsed Moon to be as much fainter than the un eclipsed as the latter was fainter than the Sun. This must be an extreme view, however, as the best authorities make the Sun 700,000 times as bright as the Moon.

With regard to the Moon's spectrum very little has been accomplished. The atmospheric bands seemed so intense and broad that they practically ran one into another, and observers simply got the two ends of the spectrum cut off.

Variable Stars—Algol.—Dr. S. C. Chandler explains the periodic variations in the intervals between its minima by supposing that the bright star with its eclipsing dark companion revolves around a distant center of gravity, determined by its relation to another dark body, during a period of 130.91 years. M. Tisserand considers that they are caused by changes in the line of apsides due to a polar compression of Algol. This hypothesis requires considerable variation in the duration of the minima; Dr. Chandler's, that there should be a periodic inequality in the proper motion of Algol. In "Astronomical Journal," No. 343, Prof. Lewis Boss, of the Dudley Observatory, at Albany, N. Y., gives a list of observed positions of Algol and of 13 comparison stars for 1895-0, for the determination of the truth or falsity of Chandler's hypothesis. If correct, the apparent orbital motion of Algol is now little less than at its maximum, and it will so continue for nearly twenty-five years, within which time it would be possible to truly determine the question.

The variability of Z Herculis was discovered by Dr. Chandler, in July, 1894, who regarded it as a variable of the Algol type, with a period of $3^d 23^h 50^m$. Its variability was detected by Hartwig also, who assigned it a period of only $1^d 23^h 55^m 40^s$. As, however, a minimum on Sept. 20 did not occur at the time indicated by either of these periods, Prof. Dunér concludes that the star is of the V Cygni type with unequally bright components, and that the faint and very bright alternate in periods of forty-seven and forty-nine hours. The hypothesis demands that Z Herculis consists of 2 stars of equal size, one of which is twice as bright as the other; that they revolve around their center of gravity in an elliptical orbit whose semimajor axis is six times the diameter of the stars; that the plane of the orbit passes through the Sun; that the eccentricity is 0.2475; and that the line of apsides is inclined

at an angle of 4 degrees to the line of sight. In this orbit the stars revolve in $3^{\text{h}} 23^{\text{m}} 45^{\text{s}} 30^{\text{t}}$. Evidently Z Herculis forms the hitherto missing link between stars of the Algol and V Cygni types. The star for 1900-0 is in right ascension $17^{\text{h}} 54^{\text{m}}$; declination $+15^{\circ} 8' 7''$.

S Corona.—When nearing minimum the nebula surrounding this star has again been seen. On Nov. 15 this variable was a stellar point in the center of a faint nebula, but on the 25th the stellar point had vanished and only the nebula remained. Unfortunately the star was then too near the Sun for its reappearance to be observed. The star for 1900-0 is in right ascension $15^{\text{h}} 17^{\text{m}} 10^{\text{s}}$; declination $+31^{\circ} 43' 6''$.

R Cygni.—At minimum, the nebula about this star was well seen. The star was invisible on Dec. 30, 1893. On Jan. 23, 1894, a nebulosity was suspected in its place. On Feb. 13 the very faint, diffuse, bluish nebula was certainly seen, as also on the 21st. The nebula on March 6 was very faint, with a suspicion of a condensed center, suggesting the reappearance of the star, and on March 24 the star was a minute but well-defined point, of the 12.1 magnitude, without any nebulosity. This is the first instance in which these curious changes could be watched in their entirety, and were made by Cuthbert E. Peck at the Rousdon Observatory, England. The star for 1900-0 is in right ascension $19^{\text{h}} 34^{\text{m}} 8^{\text{s}}$; declination $+49^{\circ} 58' 5''$.

An examination of the photographs of stellar spectra taken at Arequipa, Peru, forming part of the Henry Draper Memorial, has resulted in the discovery of 11 new variables with spectra of type III with the hydrogen lines bright.

Gould's "Astronomical Journal" for the current year has much valuable variable-star literature. In No. 347 is a revised supplement to his second catalogue of variables by S. C. Chandler. No. 339 contains an ephemeris of variables of the Algol type by P. S. Yendell. Catalogues, notes, etc., of variable stars of both short and long period, by H. M. Parkhurst, E. F. Sawyer, and others are found in Nos. 338, 346, and 350, to which the reader is referred.

Nova Auriga.—This, says Dr. Barnard, is still visible as a small star without change in physical appearance since 1892. Comparison with 2 neighboring stars shows conclusively that there has been no perceptible motion in the Nova for two years. This fixity is surprising because of the enormous velocity in the line of sight assigned to the star by spectroscopic observation. Its spectrum is that of the nebula. Its place for 1900-0 is right ascension $5^{\text{h}} 25^{\text{m}} 35^{\text{s}}$; declination $+30^{\circ} 21' 27''$. Its present magnitude is 9.7. It has been named T Auriga. In appearance it is a faint stellar point involved in a somewhat dense nebula.

Similar to the Auriga Nova in its spectrum characteristics is Nova Norma; the place of which for 1900-0 is right ascension $16^{\text{h}} 22^{\text{m}} 12^{\text{s}}$; declination $-50^{\circ} 1' 8''$. This too, as also Nova Cygni, gives the nebula spectrum, and all have the same life history.

Photographic Stars.—Prof. J. M. Schaeberle, of the Lick Observatory, has been comparing the magnitudes of the faintest stars visible on Dr. Max Wolf's photographic plates with the faintest visual magnitudes in the 36-inch

telescope at Mount Hamilton. Taking the sky in the region of Algol, and using one of Dr. Wolf's enlarged silver prints in comparison, he was surprised to find that, with an exposure of five hours, the photograph revealed stars down to the 16.5 magnitude. As the photograph was taken at the level of the sea and with a small telescope, and as a star of the seventeenth magnitude is at the limit of vision of the 36-inch glass, Prof. Schaeberle concludes that Dr. Wolf, with his relatively small telescope, can, with an exposure of five hours, photographically chart stars down to the seventeenth magnitude, or those as small as the giant refractor of the Lick Observatory will show visually.

Faint Star near Alpha Centauri.—Mr. Walter F. Gale, of Paddington, New South Wales, has noticed an eleventh-magnitude star, about 70' preceding our nearest stellar neighbor, Alpha Centauri, at position angle 272° . He is not aware of any previous observation of the star, which is not now visible, owing to its proximity to the bright star. If unconnected with the system, its distance twenty years hence, because of the proper motion of Alpha, will be very small. As the angle and distance do not oppose such an hypothesis, the remote possibility of the faint star being connected with Alpha, making it a triple system, renders it of special interest. He thinks that the best investigations of the orbit of Alpha Centauri have been made by Profs. Gill, Elkin, and See, though their determinations fail to satisfy the most recent measures, the companion being a few degrees in advance of the computed place.

Spectra of Stars.—The annual report of Prof. E. C. Pickering, Director of Harvard College Observatory, ending Sept. 30, 1894, contains a digest of much valuable work done with the varied instruments at his command. The Henry Draper Memorial is fruitful in good works, 1,657 spectra having been photographed with the 8-inch Draper telescope, and 1,708 with the 8-inch Bache glass in Peru. All the plates have been examined by Mrs. Fleming, resulting in the discovery of eleven variable stars whose spectra show the hydrogen lines. In addition to the above, 912 photographs have been taken with the 11-inch Draper telescope. Of these, 59 out of the 340 photo-spectrographs of Zeta Ursæ Majoris and 47 out of 65 of Beta Auriga have been found periodically to have double spectral lines. These stars are termed photo-spectroscopic binaries, and the investigation of their duplex character is far beyond the reach of any visual telescope. Their periods of revolution are four and eight days respectively.

Nebulous Region in Orion.—Dr. Roberts's splendid photographs of the great nebula in Orion, so much talked of in late years, have not by any means exhausted the wonders of that remarkable region. Dr. Barnard also has secured not only photographs of the giant nebula itself, but of the space surrounding it, indeed, of the entire constellation, using for the purpose not a telescope, but a camera of his own construction, with the object glass of a magic lantern giving a field 30 degrees in diameter, about one half of which was flat. His negatives portray an enormous curved nebulosity encircling the belt and the great nebula covering a large portion of

the body of the giant. The mass, which seems to be of a spiral nature, starts from a little to the west of Eta, and, involving 29, passes to the north of Kappa, whence it trends nearly due north for a considerable distance, when, turning sharply toward the west, it passes Gamma and involves 28. An outlying section curves around Rigel, making the extreme diameter of the nebulous region 14 or 15 degrees in magnitude and surpassing anything hitherto photographed in the heavens.

Something similar in appearance was previously depicted on a negative taken in southern California by Prof. W. H. Pickering. Hence the thing seen can not be ascribed to fogging of the plates or any accidental cause. Photography only can make apparent to the sense of sight such delicate, almost spiritual, films.

Proper Motion of Nebulæ.—Assuming that no body in the universe is absolutely at rest, the nebula, like the stars, must have their proper motions. Prof. Keeler has determined by the spectroscope that the great nebula in Orion, and doubtless all its appendages, are moving in the line of sight away from the Earth at the rate of 11 miles per second.

It was formerly supposed, and the identity strongly contended for, that the principal nebular line was identical with the magnesium fluting, but Prof. Keeler has proved that this is not the case. He has determined the wave length of the principal line to be $5,007.05 \pm .03$ tenth metres, and that of the second to be $4,959.02 \pm .04$ tenth metres, whence it follows that neither of these lines coincide with any known terrestrial element. The third nebular line is the H β one of hydrogen. From the displacement of this latter line Prof. Keeler deduced the motion of Orion as noted above. In like manner he showed α VI to be approaching us at the rate of about 65 miles a second, and that No. 4373, General Catalogue of Nebula, has the greatest approaching velocity of any nebula known, amounting to 402 miles per second. Also that No. 6790, New General Catalogue, has the greatest velocity of recession, equal to 301 miles a second. Among other noteworthy results of his observations may be mentioned that the spectrum of the bright-line nebula indicates either a high temperature of the gases emitting the light or a state of strong electrical excitement, and that both temperature and pressure are greatly increased at the nucleus.

In "Harvard Observatory Annals," Part I, Prof. E. C. Pickering states that no clear indications of change of shape or of brilliancy have been noted in the nebula within the last ten years by photographing it through a thin perforated sheet of brass placed in contact with the sensitive film.

The image obtained with the prism placed in front of the object glass corresponding to the H γ line is found to resemble most closely the ordinary photographs, and wave length 372 is found very strong in the southeast border of the Huyghenian region. He gives reasons for supposing the parallax of the nebula to be not greater than 0.003", corresponding to a distance that light would require a thousand years to move over.

Prof. Pickering has constructed a chart of the

nebula showing isophotal contours which will be valuable in subsequent researches of the variability of the nebula.

Photographic Nebulæ.—For several years it has been known that the cluster of the Pleiades or the Seven Stars, as it is popularly called, is filled with scattered patches of nebula. The Merope nebula, discovered in 1859 by Prof. Wilhelm Tempel, is the only one conspicuously visible in the telescope, but photography reveals the presence of several others. The entire constellation seems to be a mixture of stars and nebula.

Dr. Barnard, thinking he had observed signs of nebulosities outside of and surrounding the group, subjected his surmise to photographic proof. The exposure lasted for ten hours and fifteen minutes, and the resulting picture showed a number of singular curved and streaked nebulosities extending all around the cluster. Some of these wispy streams extend irregularly on each side of the cluster, especially toward the east, for several degrees. The photographic plate shows that for a considerable distance to the north is a region singularly devoid of small stars, but filled with large masses of very diffuse nebulosity. The discovery is important as showing that the photographic nebula may surpass the telescopic in extent and numbers.

In course of his photographic study of the Milky Way he has discovered a magnificent nebula of vast proportions in Scorpius, connected apparently with many of the bright stars in the neighborhood, including Antares and Sigma Scorpii. The latter has a large, diffused mass of nebulosity reaching northward which can be traced on the photograph to a connection with brighter nebulosity about Rho Ophiuchi.

Variable Nebulæ.—There has been long disputation regarding the variability of nebula. From observations at the Lick Observatory by Profs. Burnham and Barnard it appears that Tau Tauri is involved in nebulosity, that Hind's celebrated variable nebula was only just visible with the 36-inch telescope, and that Struve's nebula close by can not be seen at all.

The history of Hind's nebula is too long for insertion here and too interesting to be entirely foregone. In "Chambers's Handbook of Astronomy" the record of its discovery, its disappearance, and final reappearance may be found. A faint star in close proximity to this nebula varies in brightness also, and adds to the interest already attaching to the nebula.

Photograph of H. I. 84.—This nebula, which is No. 3249 of the General Catalogue, has been photographed by Isaac Roberts with his 20-inch reflector. This is described by Lord Rosse as very large and very bright, its center like an elongated nebula with nucleus, and enveloped in an irregular ring or rings of nebulous light. He thought it spiral in form, but the photograph does not so present it, and shows the nucleus to be a nebulous star of the twelfth magnitude. Surrounding the nucleus at a great distance is a well-defined ring, and in this ring several star-like condensations of nebulosity are involved. Outside this ring, but symmetrical with it, is another and fainter one, and beyond this latter are indications of still another very faint ring.

Mr. Roberts has photographed H. I. 143=

General Catalogue No. 3356, which in shape resembles the letter D, though thought by Lord Rosse to be spiral. Many other nebulae which this astronomer deemed spiral in form are not so depicted upon photographic plates.

Variation in Latitude.—When a very few years ago the suspicion was expressed that terrestrial latitudes undergo cycling variation, the thought was received with incredulity by a large majority of astronomers; but the researches of Dr. S. C. Chandler have raised to the rank of a demonstrated fact that what is known astronomically as the instantaneous pole of the Earth's rotation revolves about that of its axis of principal motion at an angular distance of $0.2''$ from west to east in a period of four hundred and twenty-seven days.

Shortly after Dr. Chandler's announcement of the four hundred and twenty-seven days' period of revolution of the Earth's axes of figure and rotation Prof. Newcomb suggested that if such a phenomenon existed it should cause a synchronous oscillation in the mean sea level, and that possibly it might be detected by a careful study of the tidal observations of the United States Coast Survey. Acting on this suggestion, the superintendent authorized Dr. A. S. Christie, the head of its tidal division, to make such an examination. He chose the observations at two mareograph stations near San Francisco, Cal., and in February, 1892, communicated his results in an official report. He found from a thirty-five years' series a tide with a period of 437.4 days and a semi-amplitude of 17.3 millimetres. Immediately thereafter Dr. Christie undertook the reduction of the Coast Survey tidal observations in Penobscot Bay, Maine, from 1870 to 1888, and found, similarly, a tide with a period of 434.9 days and a semi-amplitude of 12.5 millimetres. Combination of the two series gave a mean period of 431 ± 4 days, and a mean semi-amplitude of 15 millimetres or 0.59 inches.

The phase epochs from these tidal investigations show in a remarkable manner the harmony between the results of tidal and astronomical observation which can hardly be regarded as fortuitous. Dr. Chandler's paper on this subject may be found in "Astronomical Journal" of Aug. 15, 1895.

Simultaneous Visibility of Six Major Planets.—For several evenings during the month of June, 1895, six planets were visible at the same time. On one occasion the director of the Lowe Observatory saw in the evening sky within a single minute of time the planets Jupiter, Mercury, Mars, Venus, Saturn, and Uranus, the latter through the telescope, of course. It was an extraordinary happening, not to be repeated in many years. Mars, which but a few months before shone with such brilliancy, had diminished to the faintness of a third-magnitude star, but its redness was in striking contrast to the white light of Venus.

Unification of Time.—The joint committee of the Astronomical Society of Toronto, Canada, on the unification of astronomical, civil, and nautical days, have communicated with the astronomers of all countries for the ascertainment of opinion regarding the desirability of such change. A majority in the following-named countries declare in its favor: Austria, Aus-

tralia, Belgium, Canada, Columbia, England, France, Greece, Italy, Ireland, Jamaica, Madagascar, Mexico, Roumania, Russia, Scotland, Spain, and the United States.

Opposed to this change were Germany, Holland, Norway, and Portugal. Switzerland was neutral.

The system of changing time by entire hours, first inaugurated in the United States, is being adopted by many other countries. On Feb. 1, 1895, the plan went into effect in Australia, making the relation to Greenwich time, as follows: West Australia, eight hours; South Australia, nine; and all the other provinces ten hours ahead. At Sydney, under the new system of uniform standard time, it was necessary only to set the timepieces back less than five minutes.

Astronomical Publications.—"Astronomical Journal," Nos. 300, 319, and 347, publishes a list by Dr. Chandler of 344 variable stars with magnitudes, both of maxima and minima, the names of their discoverers, and much other important information. It is complete up to June 19, 1895. Both this table and the first and second catalogues of variables should be in the hands of all workers on this class of stars.

Cordoba Durchmusterung, Part II.—This second part of the important undertaking of the Argentine National Observatory at Cordoba, Argentine Republic, during the years 1885 to 1893 has recently been published as Vol. XVII of the "Results of the Observatory." It contains the positions and magnitudes of 160,415 stars, making, with the first part, a total of 340,215, between 22° and 42° of south declination. With this volume is an atlas of 12 maps on the same scale as Argelander's and Schönfeld's. Tables are given of the number of stars observed in each degree of declination and 4 minutes of right ascension. In the zone above mentioned ($30'$ wide) every star down to the tenth magnitude is recorded. The work in all its parts has been prepared with great painstaking by Dr. John M. Thome, director.

Dreyer's Index Catalogue.—This is a supplement to his New General Catalogue of Nebulae, by Dr. J. L. E. Dreyer, Director of the Armagh Observatory, Ireland, in which he adds 1,529 to his previous work, making the entire number of nebulae $(7,840 + 1,529) = 9,369$, all known up to the date of issue, January, 1895.

Astronomical Prizes.—The Watson gold medal was awarded to Dr. Seth C. Chandler for his valuable work on variable stars, and for his researches of the variation of terrestrial latitude.

The Janssen prize, a gold medal, was bestowed upon Prof. George E. Hale, of the University of Chicago, Ill. It is one of the high honors in the gift of the Academy of Sciences of France. This prize was established in 1887, and the medal has each year since been awarded to some worthy astronomer. In this instance it was in recognition of his spectroscopic and spectro-heliographic work on the Sun. Only two other Americans have received this medal, viz.: Prof. C. A. Young, of Princeton, N. J., and Prof. Samuel P. Langley, now secretary of the Smithsonian Institution.

The Astronomical Journal Prizes.—No. 1, with value of \$200, was awarded to Paul S. Yendell for the best series of determinations of

maxima and minima of variable stars by Argeland's method. Prof. Simon Newcomb was the recipient of prize No. 2, of the value of \$400, for the most thorough discussion of the theory of the rotation of the Earth with reference to the recently discovered variation of latitude.

The *Vols prize* was given to M. Coniel for work on the planetoids.

Islande Prize.—For his researches of the nebulae, M. Javelle received this prize.

The *Democritus prize* was awarded to M. Reverel for his methods of calculating perturbations of the planetoids.

The *Royal Astronomical Society's prize* was bestowed on Mr. Isaac Roberts for his excellent and extensive series of photographs of nebulae and clusters.

The *F. A. P. Barnard gold medal*, worth £200, was awarded to Lord Rayleigh for his discovery of argon, the new atmospheric element.

ATLANTA EXPOSITION. (See EXPOSITION.)

AUSTRALASIA, one of the divisions of the globe, consisting of the continent of Australia and the island colonies of Great Britain in the Pacific, with intervening islands. With the exception of the Dutch part of New Guinea, the German protectorates of Bismarck Archipelago and the northern Solomon Islands, the French colony of New Caledonia, and the New Hebrides and smaller groups still under native rule, all the islands of Australasia are British colonies or dependencies. The five colonies of Australia and the colonies of New Zealand and Tasmania are self-governing, having each its representative Legislature and responsible ministry, disposing of its own revenues, and making all its laws under charters granted by the British Parliament, subject to a certain reserved veto power of the Imperial Government and the appellate jurisdiction of the British House of Lords in matters of imperial concern. The Crown is represented by a Governor in each colony, who, as the executive head of the colonial government, acts on the advice of ministers chosen from the party or combination that forms the majority of the Legislative Assembly. Fiji is a Crown colony in which the natives are governed partly by their own chiefs according to their traditional customs.

Area and Population.—The area of the British Australasian colonies, computed from the latest surveys, and their estimated population on Dec. 31, 1893, are as follow:

COLONIES.	Square miles.	Population.
New South Wales.....	810,700	1,228,870
Victoria.....	97,884	*1,172,144
Queensland.....	669,497	492,299
South Australia.....	908,090	241,975
Western Australia.....	975,574	65,064
Tasmania.....	26,890	127,423
New Zealand.....	104,471	672,963
Fiji and Rotuma.....	8,045	122,712
Total.....	3,885,548	4,187,255

* March 31, 1894.

The aborigines numbered, in 1891, in New South Wales 8,280, including 3,183 half castes; in Victoria there were 565; in Queensland, about 12,000; in South Australia, 3,369 in the

settled districts only; in Western Australia there were 5,670 employed by whites. There were 13,000 Chinese in New South Wales in 1891, 9,377 in Victoria, 3,848 in South Australia, 8,574 in Queensland, and 943 in Tasmania. The Chinese are rapidly diminishing since the poll tax on Chinese immigrants was raised in 1888 to £100 in all the colonies excepting Western Australia and the northern territory of South Australia. The arrivals in New South Wales in 1893 were only 34, while 558 left the country. The wages paid to gold miners in Western Australia have attracted Chinese immigrants, and still more natives of India and Afghanistan. The law does not permit people of colored races to mine gold on their own account. The Chinese in Queensland are mainly employed in the gold mines. Those in the older colonies engage largely in market gardening. The number of Polynesian contract laborers in Queensland in 1891 was 9,428. The Polynesian immigration into that colony in 1893 was 1,212, and the emigration 1,343; the Chinese immigration was 548, and the emigration 534. In New Zealand 4,444 Chinamen were resident in 1891. The Maori population was 22,861 males and 10,132 females. The movement of population for the several colonies in 1893 was as follows:

COLONIES.	Marriages.	Births.	Deaths.	Natural increment.	Net immigration.
New South Wales....	7,749	40,342	16,022	24,320	8,059
Victoria.....	7,004	36,532	16,508	20,024	*6,418
Queensland.....	2,524	14,394	5,695	8,699	2,808
South Australia.....	2,110	10,683	4,520	6,163	*226
Western Australia.....	392	2,112	945	1,167	5,223
Tasmania.....	848	5,216	2,071	3,145	*560
New Zealand.....	4,115	18,157	6,767	11,420	10,412
Fiji.....					

* Excess of emigrants.

Finances.—The budgets of the several colonies for 1893, and the state of their debts for the fiscal year ending June 30, 1894, in New South Wales, Victoria, Queensland, and South Australia; March 31, 1893, in Western Australia and Tasmania; and Dec. 31, 1893, in New Zealand and Fiji, are shown in the following table:

COLONIES.	Revenue.	Expenditure.	Debt.
New South Wales....	£9,706,734	£10,250,022	£58,079,083
Victoria.....	6,719,623	7,354,961	46,547,708
Queensland.....	3,848,069	3,851,586	30,639,594
South Australia.....	2,526,705	2,525,666	21,653,250
Western Australia.....	570,451	640,801	2,873,098
Tasmania.....	706,972	836,417	7,645,604
New Zealand.....	4,407,968	4,170,616	88,901,830
Fiji.....	76,774	85,981	239,682

The debts were incurred for railroads, irrigation works, and similar public improvements. The older settled colonies derive a large part of their revenue from railroads, tramways, telegraphs, and another large share from the rental of public lands. These lands are sold only in agricultural homesteads.

Of the revenue of New South Wales, £2,834,479 came from taxation, viz., £2,127,645 customs, £265,554 excise, £311,637 stamp duties, and £129,643 licenses; £2,206,272 was the amount of the land revenue, £4,418,434 the revenue from the railroads and other services, and £247,551 from miscellaneous sources. Of

the expenditure, £1,895,347 went for railways and tramways, £774,502 for posts and telegraphs, £2,687,898 for interest and extinction of the public debt, £3,106 for immigration, £805,330 for public instruction, and £4,122,859 for other public works and services. The average interest on the public debt of this colony is 3·83 per cent. Of the total amounts of the loans, £38,557,903 had been expended for railways and tramways, and the rest for river and harbor improvements, water supply and sewerage, fortifications, military stores, roads, bridges, immigration, etc. The net return from railroads, telegraphs, waterworks, etc., is 8½ per cent.

In Victoria the amount of revenue raised by taxation was £2,522,779, of which £1,739,285 came from customs, £251,254 from excise, £119,216 from the land tax, £183,928 from duties on estates of deceased persons, £23,720 from a duty on bank notes, £170,000 from stamps, £19,869 from business licenses, and £15,507 from tonnage dues, etc. The revenue from railways was £2,912,788; from posts and telegraphs, £546,404; from Crown lands, £482,768; from miscellaneous sources, £494,490. Of the total expenditure, £1,836,185 went for interest and redemption of debt, £1,769,145 for working expenses of railroads, £894,466 for other public works, £716,138 for postal and telegraph service, £243,312 for expenses of Crown lands, £782,676 for public instruction, £290,751 for public charity, £198,935 for courts of law, £330,498 for police and prisons, £110,048 for customs and harbors, £104,498 for mining, £220,785 for defenses, and £492,320 for other purposes. The debt pays an average interest of less than 4 per cent.; £35,805,978 of the total debt was raised to construct railroads, £7,228,483 for waterworks, £1,105,557 for school buildings, and £1,800,969 for other public works.

Of the Queensland revenue, £1,085,638 represented customs duties, £45,804 excise and export duties, £106,752 stamp duties, £33,125 business licenses, £350,021 rents from pastoral leaseholders, £238,592 other land rents and sales, £931,053 the gross receipts of railroads, and £208,474 postal and telegraph receipts. The expenditure for interest on the debt was £1,255,533; for public instruction, £210,245; for working railways, £592,403; for posts and telegraphs, £296,407; £378,077 were expended from new loans.

In South Australia, Western Australia, and Tasmania about half the revenue is derived from customs duties, and the other half mainly from public works and lands, and nearly the whole expenditure is for interest on the debt and the maintenance and operation of public works.

In New Zealand £608,637 of revenue was raised in 1893 by direct taxation, a large part of it from a tax of 1d. in the pound on the actual value of the land and on mortgages, and an additional land tax graduated from ½d. to 2d. in the pound; £1,740,384 were received from indirect taxes, namely, customs duties and an excise tax on domestic beer; £1,169,987 were receipts of railways and £322,906 postal and telegraph receipts; £221,217 came from other ordinary sources; and £344,832 were territorial revenue. Of the total expenditure, the service of the debt absorbed £1,601,890; railways, £724,080; public instruction, £418,610; posts and telegraphs,

£282,478; constabulary, militia, and volunteers, £172,206; other ordinary expenses, £735,423; territorial expenditure, £235,929. The expenditure from new loans was £735,406.

The Australasian colonies differ from most civilized communities in the proportion of public wealth to private property. The railroads, tramways, city waterworks, irrigation works, and all such public services belong to the state, and most of the land, not only the wild lands, but the areas now utilized for sheep and cattle raising, are the property of the Government, which disposes of them gradually as communications are opened and the settlements extend. In New South Wales 44,352,937 acres, out of a total land area of 195,882,160 acres, had been alienated before the close of 1893, while 127,092,070 acres were held under time leases. This leased property is available to agricultural settlers by free selection in lots of from 40 to 640 acres, in the central division up to 2,500 acres, at £1 an acre for residents. A maximum of 820 acres can be acquired without the condition of actual residence for £2 an acre. Under this system most of the cultivated land has come into the hands of farmers with holdings of less than 500 acres. The forests, which are mostly owned by the state cover about one fourth of the total area. In Victoria 2,656,817 acres have been alienated, 15,500,000 acres are leased for pastoral purposes, 4,700,000 acres are state forests and water reserves, 1,046,000 acres are auriferous land, and 1,330,000 acres are roads. In South Australia 9,144,071 acres out of a total of 578,361,000 acres have been alienated, 29,830,971 acres are inclosed, and 87,212,160 acres are held under 895 pastoral leases. In Queensland out of a total area of 414,049,953 acres 11,517,974 had been alienated, 2,270,153 were in process of alienation on Dec. 31, 1893, and 281,316,885 acres were leased to 3,715 squatters. In this colony a maximum of 1,280 acres can be leased for agricultural or 20,000 acres for pastoral purposes, and at the termination of the leases, which run fifty and thirty years respectively, a freehold title may be purchased under certain restrictions of residence and improvement. In New Zealand, where the system of taxing land values has recently been introduced, some large areas have been acquired by speculative individuals and corporations. The total area is 67,000,000 acres, of which 10,000,000 are covered with forests, 9,000,000 are waste and water, 16,000,000 are grass and fern lands not yet disposed of or occupied, 12,500,000 acres are rented from the Government for pastoral purposes, 12,500,000 are occupied by the owners, and 7,000,000 are leased from private owners. The holders of pastoral leases, which are only given in certain localities, can acquire the fee simple to restricted areas. The public lands can be bought for cash or leased in perpetuity.

The total wealth of New South Wales was estimated in 1892 at £593,286,500, of which £46,752,900 represented railroads and other revenue-paying works of the Government, £23,493,400 works and buildings of the state that yield no direct revenue, £13,671,200 the sums due the Government on purchased lands, £98,008,000 the public lands leased but not sold, and £7,213,000 municipal property, making the sum total of the

public wealth £189,138,500, while private wealth amounted to £404,148,000, consisting of land valued at £179,043,000, buildings and other improvements reckoned at £126,896,000, and £98,209,000 worth of personal property. The cost of the Victoria railroads was £37,451,487. The net profits in 1893 were 2.89 per cent. of the capital cost, and 3.14 per cent. of the borrowed capital, on which the Government pays over 4 per cent. interest. The Queensland railroads cost £18,177,388; those of South Australia, which pay a net profit of over 3½ per cent., cost about £12,000,000, the Tasmanian railroads £3,653,000, the Western Australian over £2,000,000, and those of New Zealand £15,942,000.

The total amount of the debts, public and private, owing to Great Britain by the 7 Australasian colonies has been estimated at £315,000,000, on which £12,750,000 of interest was paid in 1894, which was less than the sum paid in the two previous years.

Commerce and Production.—The following table shows the foreign and intercolonial trade of the several colonies for 1893:

COLONIES.	Imports.	Exports.
New South Wales.....	£18,107,085	£22,921,226
Victoria.....	18,288,814	18,998,551
Queensland.....	4,852,788	9,662,662
South Australia.....	7,994,800	8,469,986
Western Australia.....	1,494,438	918,147
Tasmania.....	1,037,689	1,852,184
New Zealand.....	6,911,515	8,985,564
P.V.	276,298	855,692

The product of wool in New South Wales in 1893 was 344,982,876 pounds; the wool export of Victoria was 150,892,425 pounds, about one half being the product of the colony; the export from Queensland was about 107,000,000 pounds; from Tasmania, 9,000,000 pounds; from Western Australia, 7,400,000 pounds; from South Australia, 60,000,000 pounds; from New Zealand, 113,250,000 pounds.

The gold product of New South Wales for 1893 was £651,286 in value; for Victoria, £2,684,504; for Queensland, £2,159,390; for Tasmania, £131,104; for Western Australia, £421,885; for New Zealand, £913,138.

In New South Wales 252,606 tons of sugar cane, 748,929 gallons of wine, and 800,024 cases of oranges were produced in 1894. That colony has had a forest conservation department since 1887 which looks after 5,148,000 acres of forests, from which 196,114,000 square feet of sawed timber was taken in 1893. The value of the silver and silver-lead ore and metal raised in 1893 was £2,963,589; of copper, £73,287; of tin, £126,114; the quantity of coal, 3,278,328 tons.

In Victoria wheat and other cereals and root crops are more extensively cultivated than in New South Wales, and the manufacturing interests are larger. The export of breadstuffs was valued in 1893 at £1,067,583; leather and leather goods, £218,426; refined sugar, £99,897.

Queensland in 1893 exported tin of the value of £106,953, and silver and silver lead of the value of £42,408. The product of raw sugar was 76,146 tons. The export of sugar was valued at £753,983; of preserved and salted meat, £141,513; of frozen meat, £377,039; of

meat extract, £18,825; of hides and skins, £348,219; of pearl shell, £142,454.

In South Australia in 1894 there were 13,618,062 bushels, compared with 15,255,000 bushels in Victoria, 6,507,000 bushels in New South Wales, and 4,892,000 bushels in New Zealand. The wine crop was 712,845 gallons. The copper product was £208,967 in value.

Tasmania exported silver and silver ore of the value of £158,859; tin, £266,156; timber and bark, £57,256; hops, £13,948; fruit, green and preserved, £122,183.

The chief exports of Western Australia in 1893 were, besides gold and wool, pearl shell for £79,259, sandal wood for £32,160, timber for £78,419, and skins for £23,975.

New Zealand has a varied culture, producing, in addition to wheat, large crops of oats, barley, and hay. The export of grain and flour for 1893 was valued at £597,329; of frozen meat, £1,085,167; of Kauri gum, £510,775; of tallow, £183,588; of timber, £101,082; of hides, skins, and leather, £390,640; of butter and cheese, £354,271; of New Zealand hemp or phormium, £219,375; of preserved meat and bacon, £52,803; of grass seed, £57,544.

Communications.—The length of the railroad lines in the Australian colonies at the end of 1893 was as follows: New South Wales, 2,501 miles; Victoria, 2,975; Queensland, 2,379; South Australia, 1,810; Western Australia, 1,184; Tasmania, 475; total, 11,324 miles. In New Zealand there were 2,112 miles open on March 31, 1894, including 164 miles of private lines.

The telegraph system in all the colonies belongs to the Government. The lines of New South Wales in 1893 had 27,326 miles of wire; in Victoria there were 7,105 miles of lines, with 14,220 miles of wire; in Queensland, 10,004 miles, with 17,810 miles of wire; in South Australia, 5,546 miles, with 13,082 miles of wire; in Western Australia, 3,578 miles, with 4,303 miles of wire; in Tasmania, 2,187 miles, with 3,397 miles of wire, besides 366 miles of cable; in New Zealand, 5,513 miles, with 13,515 miles of wire. The number of dispatches sent in 1893 was 2,853,691 in New South Wales, 2,476,178 in Victoria, 1,104,311 in Queensland (1892), 220,717 in Western Australia, 207,591 in Tasmania, and 2,069,691 in New Zealand.

The postal traffic for 1893 was as follows: In New South Wales 77,540,500 letters, 850,420 post cards, 63,702 parcels, 12,060,600 packets, 44,927,900 newspapers, and 530,546 money orders; in Victoria, 62,526,448 letters, 7,491,316 packets, and 22,729,005 newspapers; in Queensland, 16,297,827 letters, 67,487 parcels, 3,925,415 packets, and 10,545,485 newspapers; in South Australia, 16,597,917 letters, 1,402,540 packets, and 8,909,279 newspapers; in Western Australia, 7,002,913 letters, 145,701 registered letters, 1,401,146 packets, and 6,001,946 newspapers; in Tasmania, 5,555,641 letters, 166,323 post cards, 1,399,973 packets, and 4,231,868 newspapers; in New Zealand, 52,085,449 letters, 2,697,110 post cards, 14,478,985 books and parcels, 19,556,030 newspapers, and 210,957 money orders.

Navigation.—The number of vessels and the tonnage entered and cleared at the ports of the several colonies during 1893 are shown in the following table:

COLONIES.	ENTERED.		CLEARED.	
	Number.	Tonnage.	Number.	Tonnage.
New South Wales.....	2,914	2,500,371	2,914	2,002,207
Victoria.....	1,889	2,009,187	1,887	2,000,201
Queensland.....	509	464,561	615	461,047
South Australia.....	948	1,180,288	971	1,212,967
Western Australia.....	298	509,958	398	501,465
Tasmania.....	698	464,312	690	468,137
New Zealand.....	617	615,004	605	642,466

The number of registered vessels and their aggregate tonnage in each colony were: New South Wales, 969 vessels, of 110,195 tons; Victoria, 439 vessels, of 93,913 tons; Queensland, 213 vessels, of 22,700 tons; South Australia, 304 vessels, of 38,902 tons; Western Australia, 157 vessels, of 5,899 tons; Tasmania, 236 vessels, of 19,499 tons; New Zealand, 478 vessels, of 73,753 tons.

Australasian Federation.—The first legal step toward the federal union of the Australasian colonies was the creation of a Federal Council as the result of an intercolonial conference. An enabling act having been obtained from the Imperial Parliament, all the colonies, with the exception of New South Wales, South Australia, and New Zealand, appointed delegates to the Federal Council, which met at Hobart, Tasmania, in January, 1886. At the next session South Australia was represented also. The Council is a purely deliberative body, with no power to legislate, but only to discuss matters of intercolonial interest and suggest subjects for the common legislative action of the colonial parliaments. The Council, which has met five times, has done very little to justify its existence except as a symbol of a more complete federation. A conference of representatives from all the Australasian colonies, held at Melbourne in February, 1890, resolved in favor of a national Australasian convention empowered to consider and report upon an adequate scheme for a federal constitution. This proposition was approved by the colonial legislatures, which elected delegates, 7 from each colony except New Zealand, which sent 3. The convention met at Sydney on March 2, 1891, and drafted a commonwealth bill embodying a plan for the union of the colonies under a governor-general, and a federal parliament, consisting of a senate and a house of representatives, with a responsible ministry and a federal judiciary. This has to be submitted to the colonial legislatures before being presented for the action of the British Parliament. The bill was brought first before the Victorian Parliament and passed the lower house, with some amendments. In New South Wales its main principles received the sanction of both houses, but not before 1893. It was brought up at various times in the other legislatures, and they have delayed forming a decisive resolution. The ardent advocates of federation in Victoria and New South Wales, finding the parliamentary method of procedure unproductive of results, organized in 1893 an Australasian Federation League, which in January, 1894, put forward a new programme. The Victorian branch of the league proposed that the constitution of the federation should be drafted by a popular convention and submitted to the direct vote of the people of the colonies. The New South Wales federationists agreed

in the main point, that the elaboration of the federal constitution should not be intrusted to the parliaments, for its adoption, but that the people should give it their direct sanction. They proposed, however, that conventions should be elected by the people of each colony to pass upon the principles, and that then a federal congress should be convened, its members to be elected by the colonial parliaments, and to this body of legislative experts should be intrusted the task of working out the details of the Constitution to be submitted to the electors of the colonies.

A conference of the premiers of all the Australasian colonies met on Jan. 29, 1895, at Hobart, where the Federal Council was holding its session, to consider the best means to bring about federation. They approved the simpler and more expeditious Victorian plan. Declaring that they regarded federation as the great and pressing question in Australasian politics, they proposed that a convention consisting of 10 representatives of each colony shall be directly chosen by the electors and be charged with the duty of framing a federal constitution; that the constitution so framed be submitted to the electors for acceptance or rejection by direct vote; that such constitution, if accepted by three or more colonies, shall be submitted to the Queen with an address from the parliaments of the colonies, praying for the necessary legislative enactment; and that a bill be submitted to the parliament of each colony for the purpose of giving effect to these resolutions.

When three or more colonies shall have elected their members to the convention, the governors of those colonies shall summon the convention. The members shall be elected under the ordinary elective franchise for members of the Legislative Assembly. When a constitution shall have been framed, the convention shall adjourn for thirty to sixty days to allow its provisions to be criticised, and then reassemble for its final adoption. It shall then be referred to the direct vote of the electors, and if it is accepted by as many as three colonies they shall, on receiving the sanction of the Imperial Government, forthwith establish a federal government. Provision is made for the entrance of New Zealand into the federation.

The Federal Council passed a counter-resolution in favor of proceeding with the consideration of the commonwealth bill by the Australasian parliaments, the method for which Sir John Forrest, Premier of Western Australia, stood out in the conference of premiers. The Council adopted also resolutions recommending official intercolonial supervision of companies, the federal regulation of their loan subscriptions, and the establishment of a federal quarantine.

Womanhood Suffrage.—In New Zealand women were admitted to the parliamentary franchise in 1893. A European of either sex who is twenty-one years of age has the right to vote if qualified by a residence of a year in the colony and three months in the district before registration, or by the possession of a freehold estate of the value of £25. Women, however, can not be members of either branch of the Legislature in this colony. On Jan. 15, 1895, the Legislature of South Australia passed the adult suffrage bill, which not only confers upon

women the right to vote, but permits them to sit in Parliament. In New South Wales a Womanhood Suffrage League was organized by Mrs. George H. Montefiore, Miss Rose Scott, Lady Winkley, and other ladies in 1891. Sir Henry Parkes, the Premier, presided over the public meetings, and to test the sentiment of Parliament in the hope of being able to expunge the word "male" from the electoral reform bill then pending, he offered a motion in favor of female suffrage. There were 57 votes against it and 34 in its favor, while 50 members refrained from voting. In the session of 1894-'95 Dowell O'Reilly moved a resolution that the franchise should be extended to women. This was carried by 68 yeas to 23 nays. Premier Reid promised to give effect to the desire of Parliament in a bill to be brought forward in the next session.

New South Wales.—The members of the Legislative Council, of whom there are 64, are appointed by the Crown for life. The Legislative Assembly, under the electoral law of June 13, 1893, has 125 members, elected by as many constituencies. Every British male subject who has resided a year in the colony and three months in his district is entitled to vote. Alien Europeans can obtain naturalization after a residence of five years. The plural and non-resident suffrage formerly possessed by owners of real estate has been abolished. Members receive a salary of £300. Each Parliament, unless previously dissolved, lasts three years. The Governor in the beginning of 1895 was Sir Robert William Duff, appointed May 29, 1893. After his death Viscount Hampden, son of the former Speaker of the British House of Commons, Sir Henry Brand, was appointed.

The Cabinet constituted Aug. 2, 1894, consisted of the following members: Premier and Treasurer, George Houston Reid; Chief Secretary, James Nixon Brunker; Attorney-General, John Henry Want; Secretary for Lands, Joseph Hector Carruthers; Secretary for Public Works, James Henry Young; Minister of Public Instruction, Jacob Garrard; Postmaster-General, Joseph Cook; Secretary for Mines and Agriculture, Sydney Smith; Minister of Justice, Albert John Gould; Vice-President of the Executive Council and Representative of the Government in the Legislative Council, William Henry Suttor.

Legislation.—The elections of 1894 condemned the protective tariff, of which Sir George Dibbs was the author. After Parliament reassembled in February, 1895, a motion of want of confidence was rejected by 66 to 27. The Labor party, holding the balance of power, sustained the Government. They influenced largely the legislation of the session. A bill reducing the salary of the Governor from £7,000 to £5,000, following the example set by the Victorian Legislature, was carried by their votes. This bill the Legislative Council did not immediately reject, as was expected, but it was laid on the table. Mr. Reid stated that the extra allowance of £2,000 would be abolished in any case. The House further decreed that no agent-general of the colony in London should hold the office longer than five years. An act was passed imposing penalties on both masters and

men if employees work more than eight hours a day. The Government, adopting the recommendations of a commission appointed to inquire into the civil service, proposing that the control over it should be vested in a board free from all ministerial influence. Political patronage would be entirely swept away, and reforms carried out in the departments that would save the treasury £250,000 a year. Some manœuvring took place over a local government bill. After the Government had inserted a provision allowing taxation on unimproved land values, Mr. Reid moved an amendment applying this principle to newly created municipalities only. He was bitterly attacked by his own supporters, and the amendment was defeated by 63 votes to 17. The Opposition joined the Labor party to vote for extending to municipal elections the principle of one man one vote. The Premier demanded that this action should be rescinded, and the Government was defeated by 5 votes, but did not resign, as the bill was dropped. A bill enacted by the Assembly giving drastic powers to a board to deal with labor disputes between masters and men was vetoed by the almost unanimous vote of the Council. The policy of the Government was revealed in the exceedingly democratic budget, which altered entirely the incidence of taxation, exempting the working class from almost every burden. Sir Henry Parkes, though supported by Sir George Dibbs and the Protectionists, objected in vain to making important fiscal changes until federation was an accomplished fact. The old leader of the Free Traders found only three of his followers willing to enter into this unnatural compact, and consequently his motion of want of confidence was defeated by 67 votes to 34. The *ad valorem* and the specific duties of the Dibbs tariff were repealed. To provide the amount of revenue thus sacrificed, amounting to £554,000, a land tax of 1*d.* in the pound was imposed, which was estimated to bring in over £400,000, and an income tax of 6*d.* in the pound, which would yield £108,000. Properties under £475 in value were exempted from the land tax. An extra tax of 20 per cent. was levied on absentee landlords, which would affect about 8,000 of the larger landowners who live in Europe on the revenues of their Australian estates. Incomes under £300 were exempted from the income tax. The only permanent tariff will be duties on spirituous drinks and narcotics, which were fixed at the following rates: Spirits, 14*s.* a gallon; sparkling wines, 10*s.* for 6 quarts; other wines, 5*s.*; beer, 9*d.* a gallon; tobacco for home consumption, 3*s.* a pound; unmanufactured tobacco, 1*s.*; cigars and cigarettes, 6*s.*; opium, 20*s.* The specific duties on kerosene, candles, and other imports that were taxed by the former Free-trade Government were retained for twelve months, after which they will be gradually reduced and finally abolished after seven years. The duty on sugar will be retained for two years, and then gradually removed by annual reductions of 20 per cent. The estimated revenue for 1895-'96 is £9,118,237 and the estimated expenditure £9,062,153. The Premier proposed to amalgamate the two savings banks, which have £7,500,000 of deposits, into a state bank that shall be

the only bank of issue. Mr. Reid changed the date of the termination of the financial year to June 30 to make it correspond with the date adopted by the other colonies. For the six months ending June 30, 1895, he originally estimated that the revenue would be £4,970,843, including £380,133 of accrued interest from the loan fund. The expenditures for the six months were estimated at £4,861,850. Subtracting the surplus to the accumulated deficit, there would still remain on July 1, 1895, a deficiency of £1,350,233, which he hoped eventually to wipe out with the surplus revenue to be obtained by his reformed system of finance. The savings already effected before the conclusion of the six months reduced the deficit to £1,216,233. The estimate of expenditure for 1895-'96 was £1,923,000 less than the expenditure for 1892, £614,000 less than in 1893, and £841,000 less than in 1894. The land-tax bill was passed in the Assembly by 50 votes to 25, and the income-tax bill by 54 votes to 23.

Conflict between the Two Houses.—On June 20, the day after the final passage by the Legislature of the customs duties bill and the land-tax bill, the Legislative Council threw out the bill for assessing the land and income tax, by a majority of 41 to 4. Mr. Reid had declared that the Administration was prepared to stake its existence upon carrying the principle of direct taxation, and had warned the Council if it did not respect the right of the lower house to shape the system of taxation to accord with the will of the electors and taxpayers of the country, then the parliamentary machinery would have to be altered. There was no governor to whom the minister could apply for the creation of new councillors, as Sir R. W. Duff had died and his successor had not yet arrived. Moreover, Mr. Reid was unwilling to employ such a provisional expedient to bridge over the constitutional difficulty, nor could he be sure that the Imperial Government, however anxious for free trade, would approve his radical changes in taxation in the face of the desperate opposition of the wealth and landholding interest unless he were fortified by a new and imperative mandate. He announced the dissolution of the House and at the same time a scheme for the reformation of the Council that would prevent future deadlocks. According to this the Legislative Council will consist of 60 members nominated for five years, one fifth retiring every year. The sole power regarding appropriation bills must rest with the Assembly, but in loan and taxation bills the upper house may propose amendments, which will fail unless they are subsequently accepted by the Assembly. Any bill that has been vetoed by the Council will pass into law if the Assembly approves it again in the next session and the people signify their assent in a referendum taken in the following recess. The tension between the two houses grew sharper. Amendments made by the Council in an appropriation bill and in a bill authorizing a loan of £2,500,000 if it should become necessary were on the motion of the Premier thrown under the table as an invasion of the rights of the Assembly. Sir George Dibbs alone dissenting, and when Mr. Reid's plan for the reform of the Council was submitted to that chamber it re-

fused by 41 votes to 3 to receive the resolution, on the ground that it was an insult.

Parliament was dissolved on July 3 and new elections were fixed for July 24.

The New Parliament.—By replacing the protective duties with a land tax and an income tax levied on the well-to-do classes only, Mr. Reid antagonized not alone the Protectionists, led by Sir George Dibbs, but the Conservative Free-Traders, who followed Sir Henry Parkes. The fiscal scheme was nullified by the refusal of the Legislative Council to pass the measures required to give it effect. In appealing to the country, the Premier announced a programme for the reform of the upper chamber, whereby life membership would be abolished and a suspensive veto substituted for the absolute veto. The Labor party went further, demanding that either the Legislative Council should be abolished or the people should decide by a referendum when the two houses disagreed.

The appeal to the constituencies resulted in a victory for the Government, with the Labor party holding the balance of power. The Ministerialists in the new Assembly number 62, the Opposition, including the followers of Sir George Dibbs and Sir Henry Parkes, no more than 40, and the Labor representatives 23.

The new Parliament was opened on Aug. 13. Mr. Reid introduced in the Legislative Council a bill for reforming that body, and in the other chamber a free-trade budget and a bill for establishing direct taxation. The reformed Council is to consist of 60 members, appointed for five years, with chance of reappointment. The land and income-tax assessment bill passed the Legislative Assembly on Aug. 30 by 62 votes to 25. The Legislative Council rejected the bill by 54 votes against 24, and the bill for its own reform by 39 votes against 13.

Victoria.—The Legislative Council, consisting of 48 members, is an elective body. Members must possess an estate of £100 annual value, and electors, unless they belong to the learned professions, must own real property rated at £10 a year or occupy leased or rented property of £25 ratable value. The Legislative Assembly has 95 members, elected for three years by universal manhood suffrage. Their pay in 1895 was cut down from £300 to £240 a year.

The Governor in the beginning of 1895 was the Earl of Hopetoun, appointed in 1889. He retired in April, and was succeeded by Lord Brassey.

The Cabinet in the beginning of 1895 was composed of the following members: Premier and Treasurer, George Turner; Attorney-General, Isaac Isaacs; Solicitor-General and Minister of Public Health, H. Cuthbert; Commissioner of Trade and Customs, President of the Board of Land and Works, and Commissioner of Crown Lands and Survey, R. W. Best; Minister of Defense, G. Turner; Minister of Mines and Water Supply, H. Foster; Minister of Agriculture, J. W. Taverner; Minister of Railways, H. R. Williams; without portfolios, A. McLean and W. McCulloch.

Legislation.—The Government had to deal with the question of reducing expenditure and increasing revenue so as to escape from the chronic deficit caused here, as in the other colo-

nies, by the falling off of revenue consequent upon the financial crisis of 1892, and especially upon the diminution of net railway receipts, which fell far below the loans raised in Great Britain to build the roads. The Legislature cut down the salaries of ministers and other officials and voted to reduce the Governor's salary from £10,000 to £5,000. After the appointment of Lord Brassey, one of the chief founders of the Imperial Federation League, the ministry had it raised again to £7,000. The Labor party, who were strong in the Assembly, rebelled against the reduction of members' salaries, and when a reduction to £200 had been voted they joined with the Opposition to block the bill and carried an adverse vote against the Government on Jan. 8. As a coalition between the Labor party and the Opposition was not thought of, the Premier did not resign, but arranged a compromise on the question of salaries. A land and income-tax bill was passed by the Assembly. The Council showed its determined opposition to a tax on land by defeating this bill by a large majority. The income tax was revived, with a reduced minimum of exemption, and the bill passed both houses. Parliament was prorogued on Jan. 29, to meet again on May 29. A board appointed to consider the revision of the tariff reported in favor of moderate protection, but condemned high or prohibitive duties, and found that the duties that had been levied to foster industries had become a burden on the community. The board advised making wine free of duty, and proposed reductions in the duties on woollens, wine and spirits, sugar, boots, hats, soap, candles, carriages, biscuits, jewelry, bicycles, farm implements, stationery, and many other articles. Commissioners were appointed to consider the question of establishing a state bank. Another board studied the management of the railroads with the view of lessening the annual deficit. A committee of public accounts was created. Subjects of legislation proposed were the safeguarding of trust funds; the settlement of farmers upon Mallee lands; the amendment of the law regarding companies; an amendment of the Constitution establishing the principle of one man one vote, and another to facilitate the settlement of differences between the two houses of the Legislature; the construction of new railroads on the lines of a report of the standing committee; an amendment of the factories act intended to check the sweating system; encouragement of the establishment of sugar factories for the development of the cultivation of the sugar beet, for which several districts were found to be admirably suited; the encouragement of the production of valuable oil and fiber plants; the promotion of the trade in frozen meat; the removal of defects in the insolvency law; and the better regulation and maintenance of charitable institutions. The chief business of the session was the revision of the tariff. The duty on Australian tobacco was slightly increased; that on cigarettes raised from 6d. to 2s.; the duties on sugar and spirits reduced, but not those on wine and beer; the tariff on machinery was made 30 per cent.; the duty on woollens was fixed at 30 per cent. for the first year and 25 per cent. after that. The revised tariff goes into force on Jan. 1, 1896.

The revenue of the colony for the year ending June 30, 1895, was £6,719,151. The customs receipts showed an increase of £92,456 and the inland revenue one of £126,994, which was chiefly due to the income tax. There was a decline in the land revenue and in fees, and the receipts from public works fell off £124,096. The deficit for the year was about £120,000.

Queensland.—The legislative powers are vested in a Legislative Council of 37 members nominated for life and a Legislative Assembly of 72 members elected by the votes of all adult males qualified by a six months' residence. Owners of real property and leaseholders have plural votes wherever their property is situated. Members of the Assembly are paid £150 a year and their traveling expenses. The Governor in the beginning of 1895 was Sir Henry Wylie Norman, appointed in December, 1888.

The ministry in the beginning of 1895 was composed as follows: Premier, Vice-President of the Executive Council, and Colonial Treasurer, Hugh Muir Nelson; Chief Secretary and Secretary for Railways, Sir Thomas McLlwraith; Minister of Lands and Agriculture, A. H. Barlow; Postmaster-General, A. J. Thynne; Secretary for Mines, Secretary for Public Works, and Secretary for Public Instruction, Robert Philp; Colonial Secretary, H. Tozer; Attorney-General, T. J. Byrne; without portfolio, W. H. Wilson.

Legislation.—In March, Sir Thomas McLlwraith resigned his offices, while remaining in the Cabinet as minister without portfolio. H. M. Nelson, Premier and Colonial Treasurer, became Chief Secretary and Treasurer; Robert Philp became Secretary for Railways as well as Secretary for Mines and Works; and David Day Dalrymple entered the Cabinet as Secretary for Public Instruction. The Government has made arrangements with steamship owners for the carriage of frozen produce to Europe, and also for the bringing of English and German immigrants at about as low a rate as the passage to the United States. Parliament assembled on June 25. The revenue for the year ending June 30 was £3,413,000, showing an increase in customs and railway receipts. The expenditure was £3,308,000. The Government, in view of this decided improvement in the public finances, contemplated a renewal of reproductive public works as far as possible, without having recourse to a new loan.

South Australia.—The Legislative Council has 24 members, who are elected for nine years, by male citizens having freehold property or a leasehold of £20 annual value. The Legislative Assembly is composed of 54 members elected for three years by universal manhood suffrage.

The Earl of Kintore's tenure of office as Governor ceased, and he left the colony on Jan. 17.

The ministry in the beginning of 1895 was composed as follows: Premier and Attorney-General, C. C. Kingston; Chief Secretary, J. H. Gordon; Treasurer, F. W. Holder; Commissioner of Crown Lands, P. P. Gillen; Commissioner of Public Works, J. G. Jenkins; Minister of Education and Agriculture, J. A. Cockburn.

Legislation.—The Parliament met on June 6. It considered bills for consolidating the public debt, granting credit to facilitate advances to producers, and the extension of public works.

Among the economies adopted to balance the budget the Government decided to abolish the militia, thus saving £10,000 a year. The revenue for the year ending June 30 was £2,424,385, a decrease of £102,320, which left a deficit for the year of about £60,000.

A reciprocity treaty has been made with New Zealand, whose barley, oats, horses, and hops are admitted free in exchange for a similar privilege granted to South Australian wine, olive oil, salt, and fruits.

Western Australia.—The Legislative Council has 21 members, elected for six years, by owners of land worth £100, or occupiers of Crown lands or of other property valued at £25 a year. The Legislative Assembly has 33 members, elected for one year by all male citizens.

The Governor is Sir William C. F. Robinson, appointed in 1890.

The Cabinet in 1895 was composed as follows: Premier, Treasurer, and Colonial Secretary, Sir John Forrest; Attorney-General, Septimus Burt; Commissioner of Lands, A. R. Richardson; Minister of Public Works, H. W. Venn; Minister for Mines and Education, E. H. Wittenrow.

Legislation.—Parliament was opened on June 25. The Government presented bills for establishing a mint, amending the gold-mining laws, reducing taxation on the necessities of life, improving the postal and telegraph services, and organizing public sanitation. The revenue for the year ending June 30 was £1,125,940, an increase of £444,695 over the previous year.

Gold Mining.—Discoveries of gold continued to be made in 1895. A party that found an enormous ledge of rich quartz 100 miles beyond Coolgardie came into conflict with the natives and killed a great number, and when they returned they were arrested for manslaughter. Prospectors suffered greatly for lack of water, and many were unable to procure sufficient food at the high prices prevailing. Good rainfalls gave much relief. Immigrants were arriving in May at the rate of 500 a week. The export of gold for the year ending June 30 was 239,594 ounces. The Southern Cross and other mining companies declared large dividends. In order to develop the reefs that have been found in great number in the Coolgardie district, some of which are found to be exceedingly rich, near the surface at least, water will have to be supplied. On some of the properties it is impossible to obtain water for boilers or stamps, and on others, where machinery has been put up, it has to be purchased at the price of 6 shillings and upward per 100 gallons. Surface storage reservoirs have proved useless by reason of the scanty and uncertain rainfall and the porous soil and rapid evaporation. The Government has set apart a sum of money to be devoted to boring artesian wells in various parts of the gold field, though the geological experts advised against making the experiment, as the formation is granite, which never has been known to contain water. If this plan fails, water will have to be pumped 346 miles from Swan river, which can give, however, but a limited supply, or the ore must be collected and carried by railroad to this river, or sea water must be brought in pipes a distance of 220 miles from Esperance Bay and pumped to an elevation of 1,500 feet.

Tasmania.—The members of the Legislative Assembly, of whom there are 37, are elected under a property or income limitation which is lower than that required of electors to the Legislative Council, which has 18 members.

The Governor is Viscount Gormanstown, appointed in August, 1893.

The ministry in the beginning of 1895 was composed as follows: Premier, Sir E. N. O. Braddon; Chief Secretary, W. Moore; Treasurer, P. O. Fysh; Attorney-General, A. J. Clark; Minister of Lands and Works, A. J. Pillinger; without portfolio, Thomas Reilly.

Legislation.—Parliament, which was opened on June 25, had little to consider except financial matters. The Treasurer expected to avoid the necessity of fresh taxation by curtailing expenses in various departments. The year's account showed a surplus of over £8,000, leaving a deficiency entailed from previous years of £442,000. A domestic loan of £500,000 at 3½ per cent. was proposed, repayable in five years. The metal production of 1894 was £830,000, a large increase over the previous year. The Premier desired to arrange a treaty of complete reciprocity with Victoria.

New Zealand.—The General Assembly consists of two chambers. The Legislative Council consists of 47 members, holding their seats for seven years, except those who were appointed before Sept. 17, 1891, when the term was for life. The House of Representatives has 74 members, including 4 Maoris elected by their nation.

The Governor is the Earl of Glasgow, appointed June 7, 1892.

The ministry in the beginning of 1895 was composed of the following members: Premier, Minister of Public Works, and Minister of Native Affairs and Defense, R. J. Seddon; Attorney-General and Colonial Secretary, Sir P. A. Buckley; Minister of Education, Minister of Labor, and Commissioner of Stamps, W. P. Reeves; Minister of Lands and Immigration, Minister of Agriculture, and Commissioner of Forests, J. Mackenzie; Colonial Treasurer, Postmaster-General, Telegraph Commissioner, Commissioner of Customs, and Minister of Marine and of Industries and Commerce, J. G. Ward; representative of the native race, without portfolio, J. Carroll; without portfolio, W. Montgomery; Speaker of the House of Representatives, Sir George Maurice O'Rorke.

Legislation.—Parliament was convened on June 20. Reciprocity treaties with South Australia and Canada were ratified. The Legislature approved a scheme of village settlements as a means of making people out of work self-supporting. The military forces were all armed with the Martini-Henry rifle before the end of the year, as Parliament had authorized. The Midland Railway Company having failed to complete its contract, the Government took possession of the line. The legislative projects submitted to the General Assembly were measures for rating the unimproved value of land, for reforming local government and charitable aid, for readjusting the tariff, for protecting family homes by restricting the influx of aliens, and for making provision for a living wage in all public contracts, besides several other labor bills. The House of Representatives has a standing

order, adopted in 1894, which limits the duration of speeches to half an hour.

The collapse of credit and financial depression having happened to New Zealand some years earlier than to the Australian colonies, the recovery also came earlier. The development of the trade in frozen meat, the improved market for Kauri gum, the buoyancy of the quartz-mining industry and increased output of gold, the improved prices of wheat, and successful shipments of live cattle and refrigerated beef operated to restore the confidence of the English public in New Zealand as a field for investments and tempted the colonial ministry, though it had taken office on a nonborrowing policy, to seek loans on favorable terms in the glutted money market of London, not, however, for public works, which were being extended at a moderate rate out of the ordinary revenue, in which is included the proceeds of sales of public lands. The New Zealand Government had not borrowed in the London market since 1887. Meanwhile the expenditure on public works had been £3,226,000. In the opinion of its public men, what the colony most needed to increase its resources was a good class of settlers on the land, such as the emigrant farmers who have developed the West of the United States. To promote the settlement of the land the Legislature had authorized advances of money to settlers at a low rate of interest. Applications under this act soon reached £500,000, and the Government decided to raise £1,500,000 in the London market to be loaned out in this way. In the summer of 1895 colonial Treasurer Ward went to England to negotiate this loan and to borrow in addition £250,000 for the purchase of private lands suitable for settlement, some of which had already been acquired by condemnation proceedings not always satisfactory to the expropriated owners. He desired further to obtain £250,000 for surveys and roads, and £250,000 to be spent on native lands, and to place £1,000,000 of consols. In pursuance of its policy the administration had increased the public debt during 1894-'95 by £730,421, besides having incurred a liability of £2,000,000 by guaranteeing the debts of the Bank of New Zealand. Mr. Ward concluded these financial arrangements.

Fiji.—The Legislative Council, which makes laws for the colony, is composed of the Chief Justice, the Attorney-General, the Receiver-General, the Commissioner of Lands, and the medical officer, with the Governor as president. The Governor, who is also High Commissioner for the Western Pacific, is Sir John B. Thurston.

Complaints were made in 1894 that the Government was arbitrary and oppressive, especially in its dealings with the natives. The attention of the Colonial Office was called to the high death rate among the islanders, which was 50.12 *per mille* in 1893. The Governor in his reply attributed this abnormal mortality to the prevalence of European epidemics, the ignorant superstition of the natives, the want of nutritious food for nursing mothers, and the unsanitary condition of the houses. In January, 1895, the islands were visited by a hurricane that destroyed buildings and shipping, and did serious and lasting damage to the coconut and banana plantations. The Government appropriated a sum

of money to meet the pressing wants of the native population, whose food supplies were destroyed. The Methodist missions took steps to afford more permanent relief.

British New Guinea.—The southeastern part of the island of New Guinea, or Papua, was annexed to the British Empire in 1888, under an arrangement between the Imperial Government and Queensland, New South Wales, and Victoria, whereby these colonies pay £15,000 a year toward the expenses of administration for the first ten years. The area is 88,460 square miles. The population is about 350,000, of whom not more than 300 are Europeans. The natives can not be deported as contract laborers. White men are allowed to acquire land under restrictions safeguarding the interests of the native race. With a view of encouraging settlers taxation has been made light, and the settlement of land-claims and the acquisition of land is rendered easy, with but few and simple restrictions upon the employment of native labor. Land is offered at 2s. 6d. an acre. The Administrator since the first proclamation of British sovereignty has been Sir William Macgregor. The local revenue in 1894 was £6,000. The value of imports was £28,501. The exports are trepang, copra, pearl shell, gold, pearls, and sandalwood. About 60 white miners are engaged in digging gold in the Louisiade Islands. The forests contain ebony and other valuable timber. Gums are plentiful. Rattan grows luxuriantly, and the coconut and sago palms are abundant. The exports in 1894 were about £25,000 in value, including pearls worth nearly £10,000.

AUSTRIA-HUNGARY, a dual monarchy in central Europe, composed, under the fundamental law of Dec. 21, 1867, of the Empire of Austria and the Kingdom of Hungary, two inseparable constitutional monarchies that are declared to be hereditary in the male line of the house of Hapsburg-Lorraine, and in case of its extinction in the female line. The legislative power in regard to common affairs, which are confined to diplomatic relations, the army, common finances, and the administration of Bosnia and Herzegovina, is exercised by committees of the legislative bodies of the two halves of the empire, which meet alternately in the two capitals, Vienna and Buda-Pesth. These committees, called the Delegations, are composed of 20 of its members elected every year by the Austrian House of Lords and the same number from the Hungarian Table of Magnates, and 40 from each of the lower houses, the Hungarian Table of Representatives and the Austrian House of Deputies. The two Delegations meet and vote separately, except when there is a disagreement, in which case the matter is decided by joint ballot. The common ministers are responsible to the Delegations, and for any dereliction of duty they may be impeached.

The Emperor of Austria and King of Hungary is Franz Josef I, born Aug. 18, 1830, who was proclaimed Emperor of Austria when his uncle Ferdinand I abdicated on Dec. 2, 1848, in consequence of a popular uprising, and was crowned King of Hungary and took his oath on the Constitution on June 8, 1867. The heir presumptive is the Archduke Karl Ludwig, the Emperor's brother; the next in succession, the latter's eld-

est son, the Archduke Franz Ferdinand, born Dec. 18, 1863.

The ministers for common affairs at the beginning of the year were: Minister of Foreign Affairs and of the Imperial House, Graf G. Kalnoky de Korospatak; Minister of War for the Whole Monarchy, Edmund, Edler von Krieghammer, General of Cavalry; Minister of Finance, Benjamin de Kallay. On May 15, in consequence of demands made by the Hungarian Prime Minister for diplomatic action regarding what the Hungarian Government considered to be illegitimate interference of the papal nuncio in Hungarian affairs, which demands, in the opinion of the common Minister of Foreign Affairs, tended to restrict the sphere of his official activity and prevent him from maintaining the independence and continuity of policy that form the main basis of the confidence of foreign cabinets, Count Kalnoky, who had been Foreign Minister for nearly fourteen years, retired from his post. He was succeeded by Count Goluchowski, who took the oath of office on May 18. Count Agenor Goluchowski, born in 1849, the son of a well-known Polish nobleman who was Governor of Galicia, studied in Austrian universities, and, entering the diplomatic career, was appointed *attaché* at Berlin in 1872, and subsequently secretary of the legation. Later he went to Paris as counsellor of the embassy, marrying there the daughter of Prince Joachim Murat, which stood in the way of his succeeding Count Hoyos as ambassador. From 1887 till 1893 he was Austrian minister at Bucharest.

The Common Budget.—The budget for common affairs for the year 1895, approved Oct. 8, 1894, makes the total expenditures 152,058,203 florins or gulden (1 florin = 41 cents), distributed as follow: Ministry for Foreign Affairs, 3,751,000 florins for ordinary and 49,400 for extraordinary purposes; Ministry of War, 118,501,466 florins for ordinary and 14,525,872 for extraordinary expenses of the army, and 10,227,060 florins for ordinary and 2,854,200 for extraordinary expenses of the navy; Ministry of Finance, 700,020 florins for central administration and 1,320,000 for military pensions; Board of Control, 128,585 florins.

The receipts are as follow: From the departments of administration, 2,678,290 florins; net receipts from common customs, 47,529,720 florins; payment of 2 per cent. of the remainder from the Hungarian treasury, 2,036,804 florins; matricular quotas, 99,803,389 florins, of which Austria pays 70 per cent. or 69,862,372 florins and Hungary 30 per cent. or 29,941,017 florins.

The extraordinary expenses for the army occupying Bosnia and Herzegovina are 3,632,000 florins.

Public Debt.—The general debt of the empire on Jan. 1, 1894, consisted of 2,732,823,356 florins of interest-bearing stock and 27,106,977 florins bearing no interest; total, 2,759,930,333 florins. This does not include the common floating debt, which amounted to 411,993,735 florins on July 1, 1893, consisting of 99,459,630 florins of interest-bearing bills and 312,534,085 florins of paper money.

Austria's special debt amounted on July 1, 1894, to 1,226,783,926 florins, having grown from

408,616,000 florins in 1880. The special debt of Hungary, contracted mainly for the purchase and construction of railroads, increased from 1,093,834 florins in 1880 to 2,228,744,358 florins in 1893. The productive public wealth is estimated to be about as much.

The Austrian Government in February, 1895, arranged with a group of financiers for a gold loan of 50,000,000 florins bearing 4 per cent. interest, which was taken at par. With the proceeds the Government expected to have enough gold to cover the state notes that were in circulation. The Hungarian Government was already in a position to restore specie payments on a gold basis, and was waiting till Austria was able to begin the operation. A Hungarian 3-per-cent. gold loan of 45,000,000 crowns, or 22,500,000 florins, was contracted for the regulation of the Danube at the Iron Gate. A Bosnian loan of 12,000,000 florins was authorized, of which 4,200,000 florins are to repay advances obtained from the Austrian and Hungarian governments for the construction of railroads, 4,900,000 florins to be used in improving and extending the railroads, and the remainder to be expended mainly for military purposes.

The Army.—The army is organized in 15 army corps, most of them containing 2 divisions of infantry, each of 2 brigades, with 1 brigade of cavalry, 1 brigade of artillery, and 1 section of railway troops. There are altogether 31 divisions or 63 brigades of infantry troops, 6 brigades of mounted artillery, 4 divisions of cavalry troops, 18 brigades of cavalry, and 14 brigades of artillery. The infantry brigade consists of 1 or 2 regiments, and has usually attached to it a battalion of yagers or of pioneers. A brigade of cavalry contains 2 or 3 regiments. A brigade of artillery consists of 1 regiment of corps artillery, with 2 separate divisions of heavy artillery, and from 1 to 3 battalions of fortress artillery. Each infantry regiment contains 4 battalions, each of 4 companies, the company consisting of 92 men and 3 officers. The infantry arm is the Mannlicher rifle of 8 millimetres caliber, with a fixed magazine holding 5 cartridges. The field artillery consists of 14 regiments attached to corps and 42 regiments of divisional artillery, each of 4 batteries of 4 pieces. The guns, of tempered bronze, have for the field artillery a caliber of 87 centimetres; for the mounted batteries, 66 centimetres. Each cavalry regiment consists of 2 divisions of 3 squadrons, the squadron having 5 officers and 166 men, with a platoon of pioneers. The peace effective of the army for 1895 is as follows:

TROOPS.	Officers.	Men.	Horses.
Staff	2,008	4,301	
Sanitary corps	51	5,861	
Military establishments	2,202	7,213	170
Regular infantry	8,376	186,566	622
Yagers	877	18,229	104
Cavalry	1,992	68,864	89,428
Field artillery	1,823	54,911	12,112
Fortress artillery	428	7,746	124
Pioneers	693	8,370	18
Railroad and telegraph troops	91	1,679	4
Trains	265	8,446	2,664
Austrian Landwehr	2,006	18,625	1,204
Hungarian Honved	2,570	17,608	8,101
Total	28,445	890,897	20,916

The war strength of the army is computed to be 45,235 officers and 1,826,940 men, with 281,886 horses.

The Navy.—The Austrian navy, designed for the defense of the coasts, has but 2 modern battle ships, the "Erzherzog Rudolf" and the "Erzherzogin Stephanie," launched in 1887, which have 12 and 9 inches of armor respectively on the water line, and carry one 13- and the other 2 12-inch guns in barbettes, and each a secondary armament of 8 guns. There are 7 casemated ironclads that were built between 1871 and 1878, an old ironclad frigate, 7 corvettes, 6 gunboats, 4 river monitors, and 3 new ram cruisers, the largest of which is the "Maria Theresa," launched in 1893, of 5,250 tons displacement, an armament of 2 9½-inch, 6 6-inch, and 11 quick-firing guns, and a nominal speed of 19 knots. Three coast-defense armor clads, of 3,350 tons displacement, are being constructed, and an addition to the large torpedo flotilla is provided for. There are now 24 first-class, 31 second-class, and 7 third-class torpedo boats and 13 torpedo cruisers. The navy is recruited by conscription, like the army, and has also its Landwehr. It had in 1894 620 officers, and crews numbering 11,684 men.

Navigation.—The number of vessels entered at the Austrian seaports during 1892 was 77,635, of 9,094,863 tons; cleared, 77,457, of 9,082,491 tons. Of the total tonnage 87 per cent. was Austrian, the Italian tonnage ranking next, and British third. At the Hungarian port of Fiume 6,287 vessels, of 987,000 tons, were entered in 1893, and 6,256, of 982,500 tons, were cleared.

Commerce and Production.—The total value of the merchandise imports into the Austro-Hungarian customs union in 1893 was 683,200,000 florins; the values of the exports, 799,200,000 florins. The values of the principal imports were: Cotton, 55,400,000 florins; coffee, 43,100,000 florins; wool, 35,200,000 florins; coal, 29,000,000 florins; silk, 24,300,000 florins; skins and peltry, 23,400,000 florins; leaf tobacco, 21,800,000 florins; machinery, 19,400,000 florins; woolen yarn, 17,100,000 florins; leather, 17,100,000 florins; books, etc., 15,800,000 florins; cotton yarn, 12,900,000 florins; silk manufactures, 12,600,000 florins; hardware and timepieces, 12,500,000 florins; woolen goods, 12,200,000 florins; grain, 10,800,000 florins; cattle, 9,800,000 florins; colors and tanning materials, 9,700,000 florins; manufactured tobacco, 4,300,000 florins.

The values of the principal exports were: Sugar, 97,100,000 florins; grain, 86,700,000 florins; timber, 59,000,000 florins; cattle, 31,200,000 florins; coal, 30,400,000 florins; eggs, 24,700,000 florins; hardware, 22,200,000 florins; gloves, 21,100,000 florins; woolen goods, 20,200,000 florins; wood manufactures, 18,900,000 florins; glass and glassware, 17,700,000 florins; paper and paper manufactures, 17,600,000 florins; iron manufactures and iron, 12,600,000 florins; feathers, 12,200,000 florins; minerals, 12,100,000 florins; wool, 11,100,000 florins; leather goods, 10,600,000 florins; linen yarn, 8,600,000 florins; silk goods, 7,500,000 florins; wine, 6,200,000 florins; flour, 5,600,000 florins.

The imports of gold and silver coin and bullion in 1893 were 150,878,210 florins, and the exports 20,979,832 florins in value.

The import and export trade with the principal foreign countries in 1893 was in florins, as follows:

COUNTRIES.	Imports.	Exports.
Germany.....	252,122,000	444,856,000
Great Britain.....	66,955,000	51,948,000
Italy.....	43,775,000	60,133,000
Switzerland.....	28,094,000	34,856,000
British India.....	51,241,000	5,590,000
Russia.....	27,328,000	26,878,000
France.....	25,229,000	27,972,000
United States.....	27,328,000	13,185,000

About half the population of the Austrian provinces and a much larger proportion in Hungary are dependent on agriculture. In Austria 36·7 per cent. of the land area and in Hungary 42·58 per cent. is occupied with farms and gardens, nearly 24 per cent. in both countries is meadow and pasture land, 32·6 and 26·8 per cent. respectively is under forests, 0·8 per cent. and 1·32 per cent. is covered with vineyards, and 0·4 and 0·32 per cent. consists of lakes and fish ponds. The product of wheat in Austria in 1893 was 15,386,000 hectolitres; of barley, 18,502,000; of oats, 31,503,000; of rye, 27,814,000. The Hungarian crops for 1892 were: Wheat, 50,239,000; barley, 18,317,000; oats, 22,007,000; rye, 16,414,000; Indian corn, 41,075,000. Austria produced 83,428,000 centners of potatoes, 49,234,000 of sugar beets, and 23,202,000 of other beets in 1893 while Hungary in the preceding year raised 40,100,000 centners of potatoes, 13,368,000 of sugar beets, and 30,058,000 of other beets. The wine crop was 4,535,000 hectolitres in Austria and 796,000 in Hungary. The value of the mining produce of Austrian mines, chiefly iron and coal, was 78,750,410 florins in 1893; the value of furnace products, 32,690,524 florins. The industrial establishments of Austria gave employment in 1890 to 2,880,897 workers, engaged in the metal and textile industries and in making earthen and glass wares, machinery, chemicals, alimentary preparations, and various special manufactures requiring skill and taste.

Communications.—At the end of 1893 the Austrian Government owned 4,380 miles of railroads, and operated 2,477 miles more that had not yet been acquired by the state, while the companies still had 3,577 miles under their private management. In Hungary there were 2,744 miles owned outright, and 3,663 miles of companies' lines worked by the Government, while 1,199 miles remained under the direction of companies.

The telegraph lines of Austria in 1892 had a total length of 17,609 miles, with 50,154 miles of wire; those of Hungary had a length of 12,473 miles, and 35,320 miles of wire; in Bosnia and Herzegovina there were 111 miles of line, and 1,780 miles of wire. The number of messages during the year was 12,068,084 in Austria, 9,969,844 in Hungary, and 425,696 in the occupied provinces.

The Austrian post office during 1893 handled 568,008,120 letters, 78,620,870 samples and books, and 70,898,600 journals. The receipts for both

the postal and telegraph services were 37,182,850 florins, and expenses 34,103,045 florins. In Hungary 129,813,000 letters, 25,900,000 packets, and 78,565,000 newspapers passed through the post office in 1892. Receipts were 14,176,000 florins, and expenses 9,802,000 florins.

The Delegations.—The Delegations met in Vienna on June 9. The report of the Committee on Foreign Affairs stated that it was recognized on all sides that the triple alliance was pacific and free from aggressive intentions, and that nobody has cause to take up a defensive attitude against it; if other powers, then, also effect a *rapprochement* among themselves with a view to the substantial protection of their own legitimate interests, it ought not to disturb the general tranquillity that was the object which the triple alliance had in view.

Austria.—The provinces composing the Austrian Empire are represented in the national Legislature or Reichsrath, and at the same time possess a large degree of legislative and administrative autonomy, each having its provincial diet or Landtag. The Reichsrath consists of the Herrenhaus or House of Lords and the Abgeordnetenhaus or House of Deputies. The Herrenhaus is composed of the princes of the blood royal, 68 large feudal proprietors, who are hereditary members, 8 prince bishops, and 131 life members. The Abgeordnetenhaus has 353 members, elected for six years by 4 classes of electors, viz., the large proprietors, the cities, the chambers of commerce and industry, and the rural communes.

The ministry constituted on Nov. 11, 1893, was composed as follows: Minister-President, Prince Alfred Windischgrätz; Minister of the Interior, Marquis Bacquehem; Minister of Public Instruction and Ecclesiastical Affairs, Stanislaus, Ritter von Madeyski; Minister of Finance, Dr. Ernst von Plener; Minister of Agriculture, Count Julius Falkenhayn; Minister of Commerce and National Economy, Graf Wurmbrand; Minister of National Defense, Graf Zeno von Welsersheimb; Minister of Justice, Graf Friedrich von Schönborn; without portfolio, Appollinar, Ritter von Jaworski.

Finances.—The revenue of the Government for 1893 was 743,232,000 florins, and the expenditure 736,201,000 florins. For 1894 the total revenue, including 17,200,754 florins from extraordinary sources, was estimated in the budget at 623,157,030 florins and the total expenditure at 620,834,011 florins, including 37,700,065 florins of extraordinary expenditures. Of the ordinary revenue 110,295,000 florins were derived from direct taxes, viz., 35,690,000 florins from the land tax, 30,813,000 florins from the house tax, 11,659,000 florins from the industry tax, 28,978,000 florins from the income tax, and 3,185,000 florins from other taxes; 296,539,875 florins were obtained by indirect taxation, viz., 110,815,080 florins from excise, 21,497,875 florins from salt, 86,616,450 florins from tobacco, 20,542,000 florins from stamps, 37,819,000 florins from judicial fees, 16,678,000 florins from the public lottery, and 2,571,500 florins from various taxes; 5,178,830 florins were received from state properties; 36,825,000 florins came from the postal and telegraph services, 83,554,750 florins from railroads, and 3,635,380 florins from other

services in charge of the Ministry of Commerce; 5,001,960 florins came from forests and domains, 7,910,921 florins from mines, and 643,238 florins from other departments of the Ministry of Agriculture; 1,077,000 florins were receipts of the Ministry of Justice, 742,600 florins were turned in by the Council of Ministers, 1,071,352 florins by the Ministry of the Interior, 314,405 florins by the Ministry of Defense, 6,157,204 florins by the Ministry of Education and Worship, 3,294,849 florins by the Ministry of Finance, and 300,015 florins were miscellaneous receipts.

The ordinary expenditures were allocated as follow: Imperial household, 4,650,000 florins; imperial chancery, 74,027 florins; Reichsrath, 746,939 florins; Supreme Court, 22,400 florins; Council of Ministers, 1,095,243 florins; Ministry of the Interior, 18,458,896 florins; Ministry of National Defense, 17,989,840 florins; Ministry of Education and Ecclesiastical Affairs, 1,738,145 florins for central establishments, 7,282,450 florins for worship, and 14,196,609 florins for education; Ministry of Agriculture, 14,108,253 florins; Ministry of Finance, 88,422,168 florins; Ministry of Justice, 21,207,820 florins; Ministry of Commerce, 101,248,120 florins; Board of Control, 177,600 florins; interest and sinking fund of the public debt, 158,488,038 florins; administrative expenses connected with the debt, 606,400 florins; pensions and dotations, 18,694,750 florins; subventions, 5,930,040 florins; Cisleithan quota of the common expenditure, 107,875,608 florins.

Cabinet Crisis.—The Windischgrätz ministry depended on the incongruous coalition of Conservatives, Poles, and German Liberals, which defeated Count Taaffe's electoral reform bill in 1893 and thus forced him to retire. These parties united against the extension of the suffrage because it would reduce their parliamentary representation. They had no principles in common in regard to electoral reform, which they did not expect to defeat permanently, nor to other political questions. The Government was likely to fall as soon as the franchise or any question involving principles arose. The Clericals, whose influence in the Government was predominant, made use of the opportunities that the situation afforded for the advantage of their party and the Church. The Anti-Semites and the Christian Socialists were at first favored by the Government, while repressive measures were applied to check the spread of social democracy. The Christian Socialists, led by Prince Alois Liechtenstein, with whom were associated other young aristocrats, encouraged by the Vatican, aimed to upset the capitalistic system and restore the predominance of the clergy and the feudal nobility in the political and social life of the country. When Prince Liechtenstein went to Linz in January to extend the Christian Socialistic agitation to upper Austria, he applied to the papal Secretary of State for the Pope's benediction upon his movement, which he said would realize the principles of the papal encyclical "*rerum novarum*," and the benediction was communicated to him in a telegram from Cardinal Rampolla. The Anti-Semites, led by Dr. Lüger, of Vienna, held out an ideal of social organization not very different from that of the Christian Socialists, and were to some extent

identified with them. They assailed the Jews because they are the chief organizers of modern industry and finance, and were equally hostile to all capitalists. This party, composed in Vienna of small tradespeople and latterly petty officials, was the rival of the German Liberals, from whose ranks it gained recruits constantly, some of them of the Jewish faith, especially since the coalition of the Liberals with the Clericals. The municipal council was composed of Liberals and Anti-Semites in equal numbers, the balance of power being held by independents, mostly re-volted Liberals, who wavered between the 2 parties but inclined more and more to the Anti-Semites. Dr. Läger was elected Vice-Burgomaster, whereupon Dr. Gröbel, the Burgomaster, resigned. When the election for the office took place on May 29 Dr. Läger was elected, but by so scant a majority that he declined to accept. Popular excitement ran so high that Anti-Semites invaded the council hall to make a demonstration and mobbed Liberal members of the council on the street. The election was postponed, and before the date set the Government dissolved the council.

An electoral reform bill was worked out by a committee of the Reichsrath and accepted by the Government, though it satisfied no party, not even the Clericals, who had the chief hand in its composition. The Prime Minister, who had promised to the working classes that were clamoring for universal suffrage a liberal extension of the franchise, said that it did not go far enough. The Young Czechs, the Poles, and the German Liberals repudiated it altogether. Agricultural laborers were excluded from the benefits of the reform, and of the workingmen of the town only those were admitted to the franchise who have steady employment the year round and had belonged to a mutual-aid society two years, nor could they vote directly, but elect delegates who meet to choose the member of the Reichsrath. Small taxpayers who have paid direct taxes one year would vote directly. The Socialistic celebration in Vienna on May 1, in which 250,000 persons took part, assumed the form of a demonstration for universal, equal, and direct suffrage, with the eight hours' day.

A project of tax reform was elaborated which had better chances of succeeding. It was proposed to exempt from the income tax earned incomes of 630 florins and incomes from investments of 600 florins, and to graduate the tax from $\frac{1}{2}$ per cent. up to 5 per cent. Persons carrying on a trade or business are subject to an additional impost, as also all joint-stock companies. From this tax small traders were exempted or taxed lighter than before, whereas large traders and manufacturers and corporations were to pay higher taxes. Foreigners were made liable to taxation equally with citizens, and the method of assessment was very stringent and inquisitorial. The official lists of the incomes of taxpayers were to be open to public inspection, and in cases of disputed returns witnesses could be summoned.

This reform was not welcome to the German Liberals, though they did not denounce it on political grounds as they did the electoral bill. They were chagrined at the treatment of nationality questions by the Government at the

dictation of the Clericals. The Italians of Istria were so incensed in January at the action of the authorities in posting official notices in two languages that the session of the Diet was broken up in disorder and the Government dissolved the House, which had passed a resolution establishing Italian as the only language in which proceedings could be conducted. A similar situation arose in Styria, where the Slovenian members in February withdrew from the Diet in consequence of a motion carried by the German majority condemning the concurrent use of their language with German in the gymnasium at Cilli. The Conservatives and Clericals, led by Count Hohenwart, approved the position taken by the Slovenians, and the Minister of Education upheld the project of teaching in the Slovenian language when the matter was discussed by the budget committee of the Reichsrath in June. The committee sustained the view of Herr von Madeyski, and after its decision in favor of the Slovenian demand the German Liberals notified the Prime Minister of their withdrawal from the coalition. The Reichsrath subsequently voted the grant for teaching Slovenian in the school at Cilli by 173 votes to 143.

The resignations of the members of the Cabinet were presented to the Emperor by Prince Windischgrätz on June 18 and were accepted. Count Kielmannsegg, Stadtholder of Lower Austria, undertook to form a Cabinet to conduct business until a definitive ministry should be formed. The provisional Cabinet was constituted on June 20 as follows: President of the Council and Minister of the Interior, Count Erich Kielmannsegg; Minister of Finance, Ritter Böhm von Bawerk; Minister of National Defense, Count Zeno von Welsersheimb; Minister for Polish Affairs, Ritter von Jaworski. The other departments were placed in charge of administrators not holding ministerial rank. The new Prime Minister, who was the author of the scheme for a greater Vienna and attendant public improvements, such as the metropolitan railroad and the regulation of the river Wien, was a Hanoverian by birth and a Protestant in religion, born in 1847, the son of an officer of King Georg. Dr. Ernst von Plener, the late Minister of Finance and the leader of the German Liberals in the Reichsrath, on July 2 resigned his seat in consequence of the failure of the efforts to maintain a permanent coalition of the moderate elements. When the Reichsrath met again in the autumn a definitive ministry was formed, Sept. 14, by Graf Badeni, Governor of Galicia, composed as follows: President of the Council and Minister of the Interior, Graf K. Badeni; Minister of Finance, Belinski; Minister of Justice, Gleispach; Minister of Agriculture, Ledebur-Wichel; Minister of Commerce, Glanz; Minister of Education, Gautsch; Minister of National Defense, Graf Welsersheimb.

Hungary.—The Hungarian Parliament is composed of the Table of Magnates and the House of Representatives. The upper house contains 20 archdukes, 286 hereditary peers paying 3,000 florins of taxes, 40 prelates of the Roman and Greek Catholic Churches, 11 representatives of Protestant confessions, 17 civil dignitaries, 82 life members, and 3 delegates

from Croatia-Slavonia. The lower house has 453 members, including 40 delegates of Croatia-Slavonia. The representatives are elected for five years by all adult male citizens who pay a certain small amount of land or income tax. The ministry in the beginning of 1895 was composed of the following members: President of the Council and Minister of Finance, Dr. Alexander Wekerle; Minister of National Defense, Baron Geza Fejervary; Minister of Justice, Dr. Desiderius von Szilagyi; Minister for Croatia-Slavonia, Emerich von Josipovich; Minister of Commerce, Bela de Lukacs; Minister of the Interior, C. de Hieronymi; Minister of the Royal Court, Count Julius Andrássy; Minister of Worship and Public Instruction, Baron L. von Keotvoss; Minister of Agriculture, Count Andor Festetics.

Finances.—The budget for 1895 makes the ordinary revenue 445,375,831 florins, and the transitory revenue 22,435,226 florins, giving a total revenue of 467,811,057 florins. The ordinary revenue was expected to be obtained as follows: State debts, 3,600,391 florins; Ministry of the Interior, 1,351,230 florins; Ministry of Finance, 303,024,837 florins; Ministry of Commerce, 118,859,277 florins; Ministry of Agriculture, 16,054,799 florins; Ministry of Education and Worship, 1,307,124 florins; Ministry of Justice, 742,964 florins; Ministry of Defense, 374,419 florins. The ordinary expenditure was estimated at 421,053,098 florins; transitory expenditure 20,046,853 florins; investments, 20,005,195 florins; and extraordinary common expenditure, 6,597,602 florins; making a total of 467,792,748 florins. The ordinary expenditure was apportioned as follows: Civil list, 4,650,000 florins; chancery, 77,065; Legislature, 1,763,958 florins; Hungary's quota of common expenditure, 26,504,967 florins; imperial pensions, 34,554 florins; Hungarian pensions, 7,902,431 florins; national debt, 126,945,391 florins; debts of guaranteed railroads acquired by the state, 13,671,747 florins; guaranteed interest of railroads, 378,928 florins; administration of Croatia, 7,843,640 florins; accountant-general, 4,000 florins; Minister-President, 411,420 florins; Ministry of the Royal Court, 60,112 florins; Ministry for Croatia, 42,760 florins; Ministry of the Interior, 14,575,314 florins; Ministry of Finance, 76,839,220 florins; Ministry of Commerce, 83,559,891 florins; Ministry of Agriculture, 16,564,716 florins; Ministry of Public Instruction and Worship, 9,589,288 florins; Ministry of Justice, 15,216,024 florins; Ministry of National Defense, 14,071,988 florins.

Ministerial Crisis.—The year opened with a crisis of an unusual sort in a country accustomed to smoothly working parliamentary institutions. All the influence of the Catholic Church and of the Conservatives dominating both the Austrian and the Imperial Government was brought to bear upon the King, who was offended with the Hungarian Cabinet on account of the insinuations made against him and his court, in regard to the first rejection of the ecclesiastico-political bills by the House of Magnates. The Clericals hoped to nullify the bills that had been passed by having their application confided to friendly hands. The King was persuaded not only that Dr. Wekerle and

Minister Szilagyi were allied with the party of Hungarian independence, because the Kossuth faction had voted with the Government on the question of civil marriage, but that the seceders, led by Count Szapary, and the party of Count Albert Apponyi could be fused with the moderate Liberals and a conciliatory ministry formed that would temper the most obnoxious of the ecclesiastico-political measures in their execution. The King delayed giving his sanction to the bills that had been passed until the Liberals were exasperated, and finally he intimated that he lacked confidence in the Wekerle ministry, forcing Dr. Wekerle and his colleagues to resign in the beginning of January, 1895. Without consulting with Dr. Wekerle, he sent for Count Khuen-Hedervary, the Ban of Croatia, whom he expected to form a fusion Cabinet. Count Khuen accepted the Liberal programme, but proposed that the two remaining ecclesiastico-political bills should be postponed till the autumn, and that the fusion of parties should be the declared aim of his policy. To this the Liberals would not agree, considering it a renunciation of their standpoint, equivalent to the acceptance of a different régime. After Count Khuen had given up the task on Jan. 9, Koloman Szell, another advocate of the immediate fusion of parties, was asked to attempt it, but he declined. Baron Banffy, President of the Chamber of Deputies, was then summoned to the King, who had at length discovered the error into which he had been led regarding the temper of the Hungarian Parliament and people. Baron Banffy was a thoroughgoing Liberal, who insisted on carrying out the whole party programme. As a Protestant, Banffy was even more obnoxious to the Clericals than Wekerle. He had established a reputation for energy and determination by his centralizing and Magyarizing course as an administrator in Transylvania, about which the Roumanians and Saxons complained bitterly, and as President of the House of Deputies he gave offense often by his stringent application of the rules; but now Saxons, Radicals, and Separatists were willing to follow him as the mandatory of the Liberal party.

The new Cabinet was constituted on Jan. 13, 1895, as follows: President of the Council, Baron Desiderius Banffy, born Oct. 28, 1843, in Klausenburg, son of a provincial prefect belonging to the ancient nobility of Transylvania, studied in Leipzig and Berlin and traveled extensively, twice an unsuccessful candidate of the Left Center for the House of Deputies, prefect of the county of Szolnok-Dobka (1875-'91), and commissary of Borszcz-Naszod County (1883-'91), member of the House of Magnates, and elected a life member after the reform, supervising curator of the Reformed Church of Transylvania, elected as a Liberal to the Chamber in 1892, and immediately chosen its president; Minister of the Interior, Desiderius Perczel; Minister of Finance, Dr. Ladislas Lukacs; Minister of Industry and Commerce, Ernest Daniel; Minister of Agriculture, Count Andor Festetics; Minister of Education and Worship, Dr. Julius Wlassics; Minister of Justice, Alexander Erdelyi; Minister of National Defense and *ad interim* Minister of the Royal Court, Baron Geza Fejervary; Minister for Croatia-Slavonia, Emerich de Josi-

ovich. Baron Samuel Josika was appointed minister at the Austrian court on Jan. 18.

The Ecclesiastico-political Bills.—Though the issue of the crisis was a blow to those who brought about the overthrow of the Wekerle Cabinet, the Ultramontanes were not disposed to give up the struggle, although Cardinal Vaszary, the primate, and the great majority of the Hungarian bishops were now willing to accept the secularizing laws, recognizing the fact that they were approved by the bulk of the Catholic population. Count Ferdinand Zichy and Count Moritz Esterhazy had organized a Catholic People's party, which already had wrested a seat from the Liberals in a Slovak district. In social politics the new party was closely affiliated to the Anti-Semites and the Christian Socialists of Austria, and, like the latter, it was encouraged by the politicians of the Vatican, whose aim was not only to preserve the prerogatives of the Church in Austria-Hungary, but to undermine the triple alliance and restore the temporal power of the Pope. The programme of the Hungarian Ultramontane Democrats declared that their object was to preserve the Christian character of the social order, to heal the wounds inflicted upon the Catholic Church in Hungary as well as elsewhere, and to watch over the economic and political interests of the people and the country. Taking their stand on the Hungarian Constitution and the compromise of 1867, they demanded a revision of the laws; the inviolability of the rights and liberties of the Catholic Church; freedom of education throughout the whole course of public instruction for Catholics and for other creeds; consideration of the interests of agriculturists, particularly of small proprietors, in matters relating to customs and communications; legislation to secure the welfare of the agricultural population; state-supported associations to provide for the requirements in the way of credit of small agriculturists and traders and facilities for the more favorable disposal of agricultural produce; the creation of a more just system of taxation, the fixing by law of a minimum income required for existence according to the Hungarian conditions of life, which shall be free from all taxation, and a tax on transactions in the stock exchange; simplification of the system of taxation, such as will enable every taxpayer to estimate exactly the amount of his contributions; protection of small tradesmen and laborers against the competition of large manufacturers and capitalists; regulation of the relations existing between the employer and his work people, particularly the protection of the family and of the moral and physical interests of the laborers, together with an extension of working-class insurance and more stringent regulations regarding periods of rest; administrative reform that is not calculated to increase the power of the state and exclude the co-operation of the people; friendly consideration of the claims of the nationalities as far as is consistent with the unity and national character of the Hungarian state; the reform of electoral abuses and the establishment of an adequate system of identification.

The People's party put forward candidates in the six districts where the newly appointed ministers were seeking re-election. The priests, es-

pecially in the districts having a large Slav population, took an active part, threatening the ignorant peasantry with the vengeance of Heaven if they opposed the Ultramontane candidates, and administering oaths at mass binding the members of their congregations to give their votes as the Church desired. The public authorities on their part resorted to coercion and intimidation, sending troops into the doubtful districts and making many arrests. The elections were very tumultuous. All the ministers were re-elected. In a subsequent by-election the Government candidate was counted in only by annulling a number of votes that were declared illegal. The Liberal candidate thus irregularly elected declined to take the seat, and another election was necessary. While the ministers deprecated the formation of a political party on religious lines as a great danger to the country, the Vatican gave public support to the movement in the form of a letter from Leo XIII to Count Zichy, approving the new union of Catholics that had been formed for the defense of the rights of the Church and the religious dignity of Hungary in the Parliament. In March a papal allocution was issued containing a protest against the civil-marriage law, which had been promulgated and would go into force on Dec. 1, 1895.

The interference of the priests in the elections provoked the Liberals to propose a law in Parliament to punish members of the clergy who thus abuse their office and to disqualify a candidate who makes use of religious services or church edifices for electioneering, who promises voters religious benefactions or threatens them with ecclesiastical penance, or who exhibits at electoral meetings objects of religious veneration or such as are used in church ceremonies.

The resolute attitude of the Liberals was shown in the election of ex-Minister Szilagyi to the presidency of the Chamber on Jan. 21 by a majority of 66. The two remaining ecclesiastico-political bills were submitted to the Chamber of Magnates when it met on March 20. At the suggestion of Count Emerich Szechenyi the bill for freedom of worship was amended by striking out a provision that the legal position of persons belonging to no received or recognized religion should be regulated by a special ordinance, which could not be revoked or amended without the approval of the Legislature. The bill for the reception of the Jewish faith among the state religions was rejected on March 24, but it was passed by the casting vote of the President on May 15, when the bills were returned from the lower house. A clause providing for the adoption by Christians of the Jewish creed was, however, suppressed. The religious freedom bill was again mutilated by the striking out of the clauses relating to persons having no religious profession.

Of the ecclesiastical reforms that had already become law the state registration of civil marriages and the law relating to the religion of the children of mixed marriages went into operation on Oct. 1, 1895. In the ceremony of civil marriage the official is bound to inform the contracting parties that the fact of having gone through the civil form of marriage does not absolve them from the fulfillment of their religious obligations.

The prescribed questions and the words declaring the parties legally married must be uttered in the Hungarian language. No fee may be charged for civil marriage. When the new law regulating the religious training of the children of parents professing different faiths went into force the decree issued by Count Cskay, Minister of Education, on Feb. 26, 1890, which threatened priests with punishment who acted contrary to the laws, and brought on the whole politico-religious conflict, was withdrawn.

Conflict with the Vatican.—In April, while Baron Banffy, in communication with the King, was considering what course to pursue regarding the ecclesiastical bills that had just been rejected by the House of Magnates, the papal nuncio, Mgr. Agliardi, went to Hungary on a visit to the primate. It was a scarcely disguised political mission, for in public utterances as well as in published conversation he took occasion to promote and encourage resistance to the ecclesiastical measures that had already become law and to excite the people against the Government. Baron Banffy drew up a protest against Mgr. Agliardi's proceedings, which he sent to Count Kalnoky with the request that it be forwarded to the Vatican. In his note, dated April 26, the Hungarian Premier informed the imperial Minister of Foreign Affairs that he would have to reply to an interpellation in the Chamber, and should say that the papal nuncio had exceeded his functions as a foreign representative, which were not different from those of an ordinary ambassador, and that representations had been made at the Vatican. Count Kalnoky, in his answer, expressed the opinion that the conduct of the nuncio showed a reprehensible want of tact, and that if he had really acted in the manner described he considered that representations were desirable. In Austria, where the Clericals were not in opposition, but dominated the Government, the intervention of the Vatican in domestic politics was not resented as jealously as in Hungary. Therefore the protest of the Hungarian Government was not forwarded at once, but was kept back in order that it might be couched in diplomatic phrases that would harmonize with the divergent policies of the two governments. Baron Banffy, in replying to the interpellation on May 1, took the ground that the influence of the Holy See in ecclesiastical matters could not be exercised by the nuncio, but solely by the Prince Primate of Hungary, and said that this view of the Hungarian Constitution was shared by the Common Austro-Hungarian Government. On the day following an official *communiqué* was published in the "Politische Correspondenz" of

Vienna expressing surprise at the statements of Baron Banffy, which were declared to be in many respects inaccurate, and consequently did not correspond with Count Kalnoky's views; it was not known how Baron Banffy was authorized to declare that Count Kalnoky shared the views of the Hungarian Government or that explanations had been demanded of the Vatican in the absence of data proving that the papal nuncio had really interfered in the internal affairs of Hungary. Baron Banffy went at once to Vienna to seek explanations. He let it be understood that he would not remain at his post if his views as to the purely diplomatic standing of the nuncio were not accepted, and if the Foreign Office refused to represent faithfully the views of the Hungarian Government in regard to foreign intermeddling in the domestic affairs of Hungary. Count Kalnoky held that the papal nuncio, while theoretically a diplomatic representative, held a different position in fact from the representatives of secular powers, because he was also the supreme chief of the Catholic Church in a Catholic state. Count Kalnoky, in his correspondence with the Hungarian Premier, had insisted upon a formal assurance that in future no parliamentary communication should be made concerning the Ministry of Foreign Affairs before its contents and form have been approved by the latter. The Hungarian Chamber, on hearing the correspondence, in which the Minister of Foreign Affairs on April 27 said that he was ready to complain at the Vatican of the tactless proceedings of the nuncio, voted that Baron Banffy's inference that representations would at once be made was justified. Count Kalnoky had placed his resignation in the hands of the Emperor-King on May 2. Franz Josef I, in view of the critical political situation in Austria as well as in Hungary, was unwilling to part with either the Foreign Minister or the Hungarian Premier, and therefore wished to treat their differences as a personal question that mutual explanations and temporary concessions would accommodate, leaving in abeyance the fundamental disagreement in policy. He consequently wrote to Count Kalnoky on May 6 declining to accept his proffered resignation. The proposed solution did not satisfy the Hungarian parliamentarians, who in interpellations in which Ministerialists and Opposition members concurred, called upon the Cabinet to vindicate the constitutional position of Hungary. As the result of a second visit of Baron Banffy to Vienna, Count Kalnoky, on May 15, again tendered his resignation, and it was accepted by the Emperor.

B

BAPTISTS. Statistics.—The "American Baptist Yearbook" for 1895 gives the following totals of the statistics for 1894 of the Baptist churches in the United States: Number of churches, 37,910; of ministers, 27,091; of members, 3,637,421; of baptisms during the year, 205,857; net increase of members for the year, 140,433. The Sunday schools returned 1,500,834 pupils.

Amount of contributions: For salaries and expenses, \$8,046,668; for missions, \$1,138,039; for education, \$174,865; for miscellaneous objects, \$2,313,008; aggregate of contributions, \$11,672,691, against \$12,500,714 in 1893.

The educational institutions comprise 7 theological schools, with 67 instructors, 937 students, and property valued at \$3,514,103; 35 universities and colleges, with 722 instructors, 9,385 pu-

pils, 946 of whom were preparing for the ministry, and \$19,370,888 of property; 27 seminaries for the education of young women, with 3,433 pupils and \$3,780,949 of property; 56 institutions for both young men and young women, with 12,774 pupils and \$3,845,146 of property; and 34 institutions for the colored people and Indians, with 4,808 pupils and \$1,417,438 of property; making, in all, 139 institutions, with 1,846 instructors, 31,337 pupils, 2,715 of whom are preparing for the ministry, and \$31,927,624 of property. Of the property of these institutions, \$14,500,782 is in the form of grounds and buildings and \$15,513,579 in endowments. The schools having the most valuable property are the University of Chicago, \$5,034,000; Brown University, \$2,791,527; Colgate University, \$2,352,000; the University of Rochester, \$1,904,078; and Columbia University, \$1,062,000. In North America, outside of the United States, including the British provinces, Mexico, Cuba, Hayti, Jamaica, other West India islands, and Central America, are returned 1,086 churches, 675 ministers, 131,316 members, and 8,451 baptisms during the year; in South America (Argentine Republic, Brazil, and Patagonia), 16 churches, 12 ministers, 648 members, and 159 baptisms; in Europe (Austria-Hungary, Denmark, Finland, France, Germany, Great Britain and Ireland, Holland, Italy, Norway, Roumania and Bulgaria, Russia and Poland, Spain, Sweden, and Switzerland), 3,855 churches, 3,121 ministers, 445,020 members, and 24,756 baptisms; in Asia (Assam, Burmah, Ceylon, China, India including the Telugus, Japan, Orissa, and Palestine), 895 churches, 562 ministers, 111,010 members, and 5,705 baptisms; in Africa, 65 churches, 86 ministers, 5,511 members, and 469 baptisms; in Australasia, 209 churches, 153 ministers, 17,928 members, and 1,304 baptisms; total for the world, 44,036 churches, 31,700 ministers, 4,348,854 members, and 276,701 baptisms; showing an increase from the previous year of 1,829 ministers, 164,347 members, and 24,977 baptisms during the year.

American Baptists. *Southern Baptist Convention.*—The Southern Baptist Convention met in Washington, D. C., May 10. The Rev. Jonathan Haralson was unanimously re-elected president. The Foreign Mission Board reported that its total receipts had been \$125,417, of which amount the churches had contributed \$123,262, a larger sum than ever before, and that the debt had been reduced to \$20,000. Six missionaries had been sent out during the year, but the number was not sufficient to replace those who had returned or were resting at home. Several persons had offered themselves as missionaries, but they could not be accepted for want of money to support them. The reports from the mission fields showed that in China there were 16 churches, 50 out stations, 41 missionaries, 25 native helpers, and 1,131 members, and 118 persons had been baptized during the year; in Japan, 1 church, 8 out stations, 6 missionaries, 5 native workers, 40 members, and 9 baptisms; in Africa, 4 churches, 7 missionaries, 6 native workers, 239 members, and 67 baptisms; in Mexico, 32 churches, 20 missionaries, 1,120 members, and 226 baptisms; in Brazil, 14 churches, 14 missionaries, 610 members, and 133 baptisms; and

in Italy, with principal stations in Rome and Florence, 18 churches, 46 out stations, 3 missionaries, 29 Italian helpers, 353 members, and 28 baptisms. Sunday schools and day schools are connected with all these missions. The contributions of the native churches amounted to \$6,458, an average of nearly \$1.90 per member. The Home Mission Board had received during the year \$215,852, or \$15,319 more than in the previous year. It had begun the year with a debt of \$6,763, and had met all its expenses, had paid \$9,476 on a house of worship in New Orleans, had reduced the debt to \$1,100, and had a small balance in the treasury. It had employed 425 missionaries, an increase of 44, under whose labors 178 churches had been constituted, 52 houses of worship built, 7,392 Bibles and Testaments and 584,938 tracts distributed, and 5,921 persons baptized. Seventy-five missionaries had been at work in the Indian Territory and Oklahoma. Institutes had been held in Georgia and Alabama at which colored pastors had been given instruction. Progress was reported of work among the Germans. The reports from Cuba were meager and not definite. The report of the board contained the reflection that "notwithstanding all that has been done by our churches and mission boards since 1845, and the great success that has attended our efforts, the Baptists having increased from 450,000 to 2,748,171 (including the colored churches) in this Southern land, there are more unregenerate persons within the limits of this convention than there were fifty years ago." The Sunday-school Board had received \$53,034, as against \$48,539 the year before. Its benevolent work included gifts in money to organizations in 9 States and to the Foreign Mission Board for Bible schools in foreign fields, amounting in all to \$4,375; gifts of literature amounting to \$1,190 to needy schools, and full sets of publications to all the missionaries of the Foreign Board and some of the Home Board; and gifts of Bibles to the needy, for which \$351 were expended. A report urging the introduction by the churches of the tithing system for raising money was adopted. The report of a conference held at Fortress Monroe with the American Baptist Home Missionary Society with reference to co-operation in the work among the colored people was adopted. A committee was appointed to devise plans for reaching the masses of the Southern Baptists in the interest of missions. A report respecting young people's meetings recommends that such churches as wish to have young people's meetings should do so, but that each church should keep entire control of the meeting, and pastors should keep the societies in close sympathy with the Southern Baptist Convention. Mr. Alberto J. Diaz, the missionary of the convention in Cuba, has under his charge, in different parts of the island, 27 churches and stations, 23 ordained ministers (besides many unordained laborers), 26 Sunday schools with 2,228 teachers and pupils, and 2,600 church members.

The Woman's Missionary Union returned resources amounting to \$24,933, including \$5,000 raised to pay off the debt.

A conference in the interest of the Young People's Societies was held in Washington pre-

vious to the meeting of the convention. Propositions were made for a general organization auxiliary to the convention, and others in favor of affiliation with the Baptist Young People's Union of America; while a considerable party opposed any general organization. A motion, called a "compromise report," for the formation of a general union auxiliary to the Southern Baptist Convention was voted down, 164 to 215.

Home Mission Society.—The sixty-third annual meeting of the American Baptist Home Mission Society was held in Saratoga, N. Y., May 30. The receipts of the society for the year had been \$515,447, and the expenditures \$455,034. The year had been begun with a debt exceeding \$101,000, with a prospect, at the usual rate of expenditure, of adding from \$30,000 to \$40,000 to it; but by careful management the amount added had not been more than \$7,000.

Eleven hundred missionaries, teachers, and other laborers had been supported wholly or in part by the society, distributed as follows: In the New England States, 41; in the Middle and Central States, 55; in the Southern States, 201; in the Western States and Territories, including 76 in Indian Territory, 771; in the Canadian Dominion, 7; in Mexico, 23. French missionaries have wrought in 8 States; Scandinavian missionaries in 23 States; German missionaries in 19 States, Manitoba, and British Columbia; colored missionaries in 19 States and Territories. Of these agents, 247 had labored among the foreign populations, 43 among the colored people, 24 among the Indians, 17 among the Mexicans, and 512 among Americans. They represented 16 nationalities, or peoples—viz., Americans, Germans, French, Portuguese, Swedes, Danes, Norwegians, Finns, Welsh, Bohemians, Poles, Indians, negroes, Chinese, Mexicans, and Italians. They had supplied 1,933 churches and out stations, and returned 50,132 church members, 6,192 received by baptism during the year, 150 churches organized, 1,242 Sunday schools with an attendance of 72,115 pupils, and \$91,152 of benevolent contributions. The society aided in the maintenance of 35 established schools for the colored people, the Indians, and the Mexicans, 16 day schools for the Chinese, and 2 day schools in Utah and 1 in New Mexico. Of the 28 schools for the colored people, 15—including 3 of the higher schools and 12 of the secondary or academic schools—were under the entire control of colored trustees, but are subject to visitation by the superintendent of education, and made the same reports to the office in New York as the schools controlled directly by the society or by boards of white trustees. In all the schools for the colored people, 232 teachers were employed. The whole number of pupils was 4,558, of whom 373 were studying for the ministry, 1,379 were preparing to teach, 20 were in the teachers' professional course, 35 in the missionary training course, 32 in the nurses' training course, and 1,128 had received systematic training in some line of industrial work. Two hundred and ten pupils were enrolled in the schools for Indians, 9 of whom were studying for the ministry and 30 preparing to teach. Of the 15 missionaries employed by the society in Mexico during the year, 10 were Mexicans. Besides these, the two Women's Home Missionary Soci-

ties, at Chicago and Boston, had supported 3 women missionaries and 9 teachers.

In the church edifice department, 89 churches had been aided by gifts and loans during the year, in the sum of \$33,493.

The report contained some observations regarding the relations of the society with the people of the South, which were called out by discussions in the report of the previous year concerning the origin of the fires by which 3 of the society's school buildings had been burned, which fires were supposed to be of incendiary origin, and were attributed, as was also the beating of one of the teachers, to Southern hostility to negro education. These allegations were denied by Southern Baptists; the facts concerning the fires were again inquired into, and it was found that one of them was accidental; another was probably instigated by personal malice; and with respect to the burning of Benedict College, Columbia, S. C., positive proof was wanting. "That," however, "there is, unfortunately, extensive though not universal prejudice in the South against higher education for the negroes, as provided for them in the society's schools, and that this prejudice has seriously hindered our work, is capable of overwhelming proof. The most serious event alluded to in the last report—the brutal beating of Prof. Reddick by white men for the offense of teaching and preaching to negroes—has never been called in question. During the past year, however, there has been not only no violence exhibited toward our work, but there has been manifested a growing spirit of appreciation of its importance, its urgency, and its wisdom. We believe there is a greatly improved public sentiment, among a large body of Southern people, certainly, regarding this whole matter." Illustrations were given of this improving condition. The belief was expressed that the plan of co-operation between Northern and Southern Baptists would be productive of results of a high order, especially in improved methods of conducting missionary work by the negro evangelists.

The original charter of this society was granted in 1832, and contemplated simply "the preaching of the Gospel in North America." In 1849 it was found desirable to amend the charter, and in 1877 it was still further amended so as to provide for the establishment and maintenance of schools for freedmen in the South. Now it has been found desirable still further to broaden the scope of the society, so as to enable it to establish, maintain, and aid Baptist churches and missions, acquire sites for buildings, and establish and care for schools in connection with its missionary work. It was already authorized to take and hold necessary real estate and receive, accumulate, and hold in trust endowment funds for the support of its freedmen's schools, provided the income from the whole did not exceed \$50,000 a year, and to hold real estate and endowment funds for its general work, provided the income did not exceed \$10,000 a year. By amendments to the charter recently obtained in the State of New York, these restrictions are removed.

Publication Society.—The seventy-first annual meeting of the American Baptist Publication Society was held at Saratoga, N. Y., June 1,

The receipts from sales had been \$532,763, against \$497,807 in 1894, and from other sources \$19,950. The sum of \$6,766 had been transferred from the profits of the publishing department to the missionary department. The whole amount received for Bible work had been \$15,243, and the amount received for missionary work \$112,609. Sixty-three new publications had been issued, of which 362,250 had been printed. Eighty-five missionaries and workers had been employed, in connection with whose labors 648 persons had been baptized, 62 churches constituted, 244 Sunday schools organized, 500 Sunday schools aided by gifts of the Scriptures, books, etc., and 233 ministers aided in grants for their libraries. Three chapel cars had been in operation along lines of railroad, visiting destitute places, with the result of many conversions. A resolution was unanimously adopted protesting against the arrest and punishment of persons who, having conscientiously observed the seventh day as a day for religious rest and worship, have on the first day of the week conscientiously engaged in labor which in no wise disturbed other citizens, as a violation of the rights of religious liberty. A conference was directed with the American Bible Society respecting the circulation of the Scriptures in languages other than English, that its co-operation may be secured for publishing and distributing the versions made by Baptist missionaries and approved by Baptist missionary societies.

Missionary Union.—The eightieth annual meeting of the American Baptist Missionary Union was held at Saratoga Springs, N. Y., beginning May 27. The society had begun the year with a debt of \$203,596, in view of which it had been obliged to reduce its appropriations by \$109,000. On this basis it had met the year's appropriations and reduced the debt by the amount of \$13,639. The total income of the society had been \$661,255. The appropriation had amounted to \$564,200, and \$83,416 had been added to the permanent fund and bond account. A noteworthy feature of the work abroad was the increase of the number of self-supporting churches in heathen lands from 377 to 458, and of self-supporting schools from 247 to 369. Other items of increase were: Missionaries, 8; native preachers, 82; churches, 41; church members, 5,770; pupils in Sunday schools, 1,330. Connected with missions to "nominally Christian" lands were 1,167 preachers; with missions to the heathen, 1,053; making in all 2,220; churches in the former missions, 866; in the latter, 787; making a total of 1,653. The baptisms during the year numbered 11,791. The present membership in the churches was 190,998, and the number of pupils in Sunday schools 92,326. Amount of contributions spent on the field, \$289,532. An amended constitution for the Union was adopted, among the features of which are the requirement that at least one fifth of the board of managers shall be women, and the constitution of the presidents of the women's foreign missionary societies *ex-officio* members of the board of managers. An application on behalf of the mission of the Rev. A. Ben Oriel to the Jews in Jerusalem to be taken under the care of the Union was referred to the Executive Committee. A committee on self-support on foreign

fields reported, recommending steps to promote this object. The true aim, the report said, being the planting of native churches that will be self-supporting and reproductive, involves a modification of the excessive and sentimental pity which many feel with regard to the hardships that the natives must undergo. Proportionate giving should be urged; so, also, native churches should be plain in architecture and cheaply constructed; the congregation rather than the missionary should make the choice of the pastor, and the practice in some churches of sending money to support native preachers should be discouraged. Some form of industrial education also should be maintained in connection with the mission. A resolution was adopted favoring the formation of home-mission societies in all missions, so that lessons of self-support may be taught to the converts.

Other Societies.—The total receipts of the Baptist Education Society for the year had been \$20,211, of which Mr. John D. Rockefeller had contributed \$19,091. Payments of \$16,289 had been made to 13 colleges which had collected altogether \$76,907 of endowment pledges; making a total addition to their endowment funds of \$93,196.

The Woman's Baptist Home Missionary Society, Chicago, had had in its employ during the whole or part of the year 114 missionaries, at 82 stations, among native Americans, European populations, Jews, Indians, negroes, Chinese, Mormons, and Mexicans. It and its auxiliaries co-operate with the American Baptist Home Mission Society and with State and Territorial conventions on the frontier in the support of certain teachers and beneficiaries, for which it had contributed \$5,062 during the year. At the thirteenth annual commencement of its training school, June 29, 1894, 12 American, 4 Swedish, 3 German, and 1 Icelandic pupils were graduated; all but 2 of whom entered the mission service in some form. A movement has made considerable progress for the establishment of a training school for colored women. The total receipts of the society for the year were \$64,129, and the disbursements \$62,710.

The work of the Woman's Baptist Home Mission Society, centered at Boston, Mass., is chiefly educational. Sixty teachers were under appointment in 1894, for whose work \$27,000 had been expended. Their field embraced Alaska, China, Mexico, the Indians of the United States, etc.

The twenty-fourth annual meeting of the Woman's Baptist Foreign Missionary Society of the West was held at Fort Wayne, Ind., April 16 to 18. The financial report showed a deficiency for the year on general account of \$9,530, the receipts having been \$43,278, and the expenditures \$52,808. The receipts for the Home for Missionaries' Children were \$1,516, and the expenses \$1,669, but a deficiency was averted by the aid of a cash balance from the previous year. The society had 47 missionaries in the field, with 2 under appointment, 110 Bible women, and 37 schools, with 2,050 pupils and 100 native teachers. During the year 4 new missionaries were sent out and 2 returned to their fields, and 110 baptisms were reported. Ten candidates were under appointment or in preparation.

The fifth international delegate convention of the Baptist Young People's Union of America (United States and Canada) was held in Baltimore, Md., July 18 to 21, and was attended by 6,550 enrolled delegates. The board of managers reported that \$14,358 had been raised during the year toward a proposed founding fund of \$50,000, making the whole amount secured so far \$32,851. The Union furnishes three courses of religious study for its members—the Bible Readers' Course, the Conquest Missionary Course, and the Sacred Literature Course—in which examinations are conducted each year. The meetings of the convention were devoted to addresses, educational discussions, conferences, and religious exercises.

German Baptist General Conference.—The German Baptist Triennial Conference met at Dayton, Ohio, Sept. 24. The Rev. J. Grimmel was re-elected moderator. Although the past year had not been as fruitful of converts as the preceding one, 1,400 baptisms were reported in 230 churches numbering about 20,000 members. The discussions of the conference concerned chiefly the Theological Seminary at Rochester, N. Y., home missions, foreign missions in Germany and other countries, and publication. A probability was announced that the aid hitherto afforded to the Theological Seminary would be withdrawn on account of financial stringency. An effort was determined upon to raise the sum of \$100,000 for the support of the German professors, and subscriptions of \$10,000 toward this amount were taken up in the conference. Demands for home missionaries were reported coming in from every quarter. A question as to the policy of continuing German churches arose during the discussion of this subject, when the Rev. J. Grimmel, moderator, said that such churches would be necessary as long as immigration continued. It would be no gain for Christ's kingdom or for America if these churches should too soon become English-speaking. To most of the 10,000,000 Germans in the United States the Gospel must be preached in German if they are to understand it. The process of assimilation, however, was constantly going on. Ten thousand German members had already taken out their letters and joined English-speaking churches—"a proof to the Home Mission Society that their work had not been in vain." Arrangements were making for the co-operation of the publication house with the American Baptist Publication Society, and the subject of making the concern a part of that society was referred to a committee, to report to the next triennial conference. Reports of the orphan asylum at Louisville, Ky., and of the Mutual Aid Society were considered.

Baptist Congress.—The thirteenth meeting of the Baptist Congress was held in Providence, R. I., Nov. 12 to 14. The Rev. E. B. Andrews, D. D., LL. D., President of Brown University, presided. The first theme discussed was that of "Monism," which was considered in papers on its philosophical basis, by Prof. F. C. French, of Vassar College; its relation to theology, by the Rev. Dr. A. Hovey; and its ethical bearing, by Prof. Gordon B. Moore, D. D., of Furman University, South Carolina. "The Centralization of Baptist Policy" was discussed

by the Rev. J. D. Christian, D. D.; the Rev. Cephas B. Crane, D. D.; and the Rev. D. W. Faunce, D. D. Each of the appointed speakers conceded imperfections in the working of Baptist polity, but none suggested increase of centralization as a remedy. Papers referring to the New Testament were on the "Canonicity of its Books in the Light of Modern Research," by the Rev. D. D. Hahn, and "Types of New Testament Theology," by the Rev. P. A. Nordell, D. D. "The Relation of the State to Semipublic Corporations and their Employed" was presented in a paper sent by the Hon. T. E. Barkmerth in reference to railroads, and a paper by Prof. Albion W. Small in reference to trusts and monopolies. On the subject of "The Physiological Basis of Morality," the appointed speakers were Prof. W. I. Potat, the Rev. S. B. Meerer, and Smith Baker, M. D. The closing addresses were on "The Baptism of the Holy Spirit," by the Rev. F. L. Chapell and the Rev. H. M. Sanders, D. D. The reading of the papers by appointed speakers on each topic presented was followed by volunteered addresses from other members of the congress.

British Baptist Union.—The annual meeting of the Baptist Union of Great Britain and Ireland was held in London, beginning April 23. The Rev. J. G. Greenhough, of Leicester, presided. The report of the council showed that £147,026 had been spent during the year on new chapels, £30,576 on improvements, new schools, etc., and £50,166 in paying debts. Six associations, 1 college, 49 churches, and 18 personal members had joined the Union during the year. A question had been raised, at the autumnal meeting in 1894, on the admission of a woman who had been appointed as a delegate. While the council regarded this appointment as a "revolutionary innovation," it had decided that the constitution admitted of the appointment of women as delegates. A resolution was adopted with reference to making an effort, in connection with the centenary of the Home Mission fund in 1897, to secure it an adequate permanent increase. It was represented in the discussion that the average income of the mission pastors was about £90. In some cases it was only £60 or £70. Resolutions were passed that the meeting "views with the greatest distress the growth of gambling among all classes of the community, and would earnestly call upon the Legislature to turn their serious attention to enforce the laws already existing, and to enact such other measures as will bring about the object desired"; protesting against the atrocities that had been perpetrated in Armenia, and calling upon the Government, "in accordance with treaty obligations, to take immediate steps to prevent the continuance of such barbarous persecution"; authorizing an appeal to Parliament to appoint a national board of conciliation to which disputes between employers and employed may be referred, with a view to settlement with promptitude and justice; approving the Welsh disestablishment bill, hoping that in its main provisions it would become a law, and expressing the belief that all State establishment of religion is opposed to the progress of Christ's kingdom on earth, and consequently to the best interests of the nation;

approving the local veto bill (of the sale of intoxicating liquors). The officers of the union were requested to prepare and submit to the autumnal assembly a letter to his Holiness the Pope, in reply to his recent invitation to English Christians to return to the Church of Rome.

The autumnal assembly of the Union was held at Portsmouth, beginning Oct. 8. The address of the president, Mr. Greenhough, concerned the question of Catholicism and reunion which had been much discussed. A reply, in the form of an address to the English people, was adopted to the encyclical which had been promulgated from the papal court inviting a return to the Catholic fold. In it the society declared that it could not adopt the position "that complete unity of opinion is an indispensable condition of Christian fellowship or intercommunion, but reunion with the Roman Church is rendered impossible by the maintenance of beliefs and practices which we deem subversive of the first principles of Christ. We, in common with a vast majority of English Christians, are under the solemnly pronounced 'anathema' of the Roman Church because we deny the following propositions:

"1. 'That it is a dogma divinely revealed that the Roman pontiff, when he speaks *ex cathedra*, is possessed of infallibility, and that therefore such definitions of the Roman pontiff are irreformable.'—*Decrees of the Vatican Council.*

"2. That the Apostle Peter was 'appointed the prince of all the apostles and the visible head of the whole Church militant'; and 'that the Roman pontiff is the successor of blessed Peter in this primacy.'—*Ibid.*

"3. That the Virgin Mary and other saints are our intercessors in heaven, and that 'it is good and useful suppliantly to invoke them.'—*Decrees of the Council of Trent.*

"4. That 'honor and veneration' are to be given to 'images of Christ, of the Virgin, and of the other saints,' also to 'relics of saints.'—*Ibid.*

"5. That there is a purgatory, and that the souls there detained are helped by the suffrages of the faithful.'—*Ibid.*

"6. That Christ instituted an order of sacrificing priests to 'offer his own body and blood.'—*Ibid.*

"7. That the Lord's Supper is a propitiatory sacrifice in which bread and wine become the very body of Christ, and as such are offered to God.—*Ibid.*

"8. That sacramental confession and penance were instituted by Christ.—*Ibid.*

"9. That in 'absolution' sentence is pronounced by the priest as a judge.—*Ibid.*

"10. That 'the power of granting indulgences was granted to the Church.'—*Ibid.*

"11. That baptism is necessary to salvation, and that by it we are made entirely new creatures.—*Ibid.*"

Reference was made in this address to the pastoral letter of the Archbishop of Canterbury, and renewed assurance of brotherly love was made to all reformed Churches in English-speaking lands. The address then directed itself to those Englishmen "who do not glory in the Christian name, confessing the faults and deploring the divisions of the Church and its failure to reach the divine ideal, which was, however, "sought more ardently and with more definite conceptions of its worth and world-wide significance than at any other time"; and, continued, "we invite men to judge and condemn our defects, but we entreat them not to spurn

the ideal because too sublime for present attainment, or because it has been travestied by unworthy institutions in the past. In the greater matters of belief all Christians, including the Romanists, are agreed; we differ in things supplementary." The assembly approved the work accomplished by school boards since 1870, and demanded that the school board system be extended to every part of the country, and a board school be placed within easy and reasonable distance of every family; renewed its protest against denominational teaching and preferences; demanded that all public elementary schools be placed under the management of boards elected by the people; and instructed the council of the Union to co-operate with other representative unions and conferences in the formation of a national vigilance committee for the maintenance of the rights of nonconformists. The assembly's protest against all establishments of religion by the state was renewed. The system of local option for the control of the traffic in intoxicating drinks was approved. An appeal was made at the meeting of the Missionary Society for an additional income of £10,000, simply to maintain present operations in foreign missions, leaving re-enforcements out of the question.

Baptist Missionary Society.—The one hundred and third annual meeting of the Baptist Missionary Society was held in London, May 18. The report showed that the total receipts on general account had been £60,000, or £3,219 more than in 1893, and the expenditures had been £68,753, showing a decrease of £1,868. The society's debt had risen from £14,183 to £22,860. The unappropriated balance of the Centenary fund would reduce this figure to £7,056, that fund having now produced £118,717. The churches were reminded that without an increase of £9,000 in the ordinary income a further heavy debt would be incurred. From the mission fields were returned: India, 77 European and native missionaries at 178 stations, 6,115 children in the day schools under 221 native Christian teachers, and 5,313 pupils and 313 teachers in Sunday schools; China, 21 missionaries and 53 native evangelists at 188 stations in Shantung, Shensi, and Shansi, with 21,926 patients treated by the medical missionaries at Taing-Choo-Foo and Chou-Ping; Congo Free State, 27 missionaries, with the native churches entirely supporting native evangelists; West Indies (Bahamas, San Domingo, Turks and Calcas Islands, and Trinidad), 3 missionaries and 136 evangelists, besides 3 missionaries at the Calabar College, Jamaica; Brittany, 1 missionary and 3 evangelists; Italy, 6 missionaries and 14 evangelists; and Nablous, Palestine, 1 missionary.

Other English Societies.—The Baptist Tract and Book Society had made grants of 300,000 tracts for use in England and the colonies during the year. A new departure had been made in the publication of the works of eminent American writers. A new set of rules was adopted at the annual meeting, in order, without disregarding the views of the founders, who were Calvinistic and strict communion Baptists, to secure the support of all Baptists. The income of the original capital of £700, and such other moneys as may be expressly given for the purpose, are to be devoted to the promotion of

the stricter views, and strict communion Baptists to the number of 10 are to be made life members of the committee.

The report of the Baptist Building fund showed that 41 churches had been aided with loans amounting in all to £10,915. The capital of the fund stood now at £57,442. All the installments due on loans had been received.

The Bible Translation Society returned £1,309 as the amount of the Legacy fund.

The Zenana Missionary Society held its first annual members' meeting April 28. Though it had been at work for twenty-eight years, it had hitherto been without a proper constitutional existence, and an organization was now for the first time completed. The year's receipts, £9,005, had been insufficient by £250 to meet the expenditure. Missionary work was carried on in India at 24 stations, by a staff of 54 missionaries, 200 native Bible women and teachers, with 80 schools with 3,240 children. Regular instruction was given in 1,300 zenanas, and 1,707 houses were visited for Bible teaching alone. Medical work was carried on at Delhi, Palnal, and Bhi-nani. In China, 4 missionaries were at work in the Shan-Tung province.

The annual meeting of the Baptist Building fund was held April 18. The report showed that the capital of the fund was £51,442, showing an increase of £50. The congregational collections amounted to only £51. During the year, £10,915 had been lent to 41 churches, in sums varying from £25 to £500, and for periods varying from two to ten years. Applications for loans to the extent of £8,920 were awaiting the committee's decision, and these would absorb the ordinary income of the fund for the next nine months. It was remarked that in 1865 the loans amounted to £3,340; in 1875, to £4,385; in 1885, to £8,450; and now, in 1895, to £10,915.

Baptists in Sweden.—The Baptist churches in Sweden returned an increase of 1,310 members during 1894, the total membership at the beginning of 1895 being 37,601, with 552 churches distributed among 19 district associations. The number of preachers was 644, and of houses of worship 301, valued at 2,380,730 kronor, against which the indebtedness was 771,651 kronor. The Sunday schools included 40,353 pupils and 3,175 teachers. The sum raised for different branches of work was about 420,000 kronor. The theological school was favorably reported upon.

Baptists in Holland.—A jubilee celebration of the beginning of the Baptist churches in Holland was held May 22 and 23, at Stadskanal, near the field water trench in the neighborhood of Groningen, where the first seven believers were baptized fifty years ago by the late Pastor Kobner. Two of these persons are still living, seventy-four and ninety-two years old, respectively. The seven, with three others, were formed into the first Baptist church by Pastor Oncken, of Hamburg. From this beginning have grown 19 Baptist churches.

BELGIUM, a constitutional monarchy in western Europe. The Senate has half as many members as the House of Representatives, elected for eight years, one half being renewed every four years, 26 by the provincial councils, and the rest by citizens paying 1,200 francs in direct

taxes or possessing real property yielding 12,000 francs rent. The Chamber has one member to 40,000 of population, elected directly for four years, one half retiring every two years, by all resident male citizens twenty-five years of age, who have an additional vote for each of the following conditions: Being thirty-five years old and married or widowed with legitimate offspring, and paying a personal tax of at least 5 francs; possessing real estate worth 2,000 francs or renting for 100 francs a year. Citizens having diplomas of superior instruction, or who have filled a public office, or have attained a position that presumes a liberal education, have, moreover, 2 additional votes. The revised Constitution of Sept. 7, 1893, which extended the franchise, sanctions the acquisition by Belgium of colonies or protectorates beyond seas. In default of a male heir to the throne, the King is authorized to nominate his successor with the approval of the Chambers, given by a majority of two thirds of their members. The reigning sovereign is Leopold II, born April 9, 1835, who succeeded his father, Leopold I, the first King of the Belgians, on Dec. 10, 1835. The heir presumptive is Prince Albert, second son of Philippe, Count of Flanders, the King's brother.

The ministry in the beginning of 1895 was composed as follows: President of the Council and Minister of Public Instruction, J. de Burlet; Minister of Justice, V. Bégère; Minister of Finance, P. de Sinet de Nayer; Minister of Agriculture, Industry, and Public Works, L. de Bruyn; Minister of Railroads, Posts, and Telegraphs, J. H. P. Vandenspeereboom; Minister of Foreign Affairs, Comte de Mérode-Westerloo; Minister of War, Lieut.-Gen. J. J. Bressine.

Area and Population.—The kingdom has an area of 11,373 square miles, and on Dec. 31, 1893, had a population of 6,262,272, or 531 to the square mile. There were 3,124,068 males and 3,138,204 females. The vital statistics for 1893 were: Living births, 183,062; deaths, 125,530; marriages, 47,065. The number of immigrants in 1893 was 21,686 and of emigrants 22,117, showing a net emigration of 431. Every commune must maintain at least one elementary school, of the expense of which it bears two thirds, the other third being shared by the state and the province. In 1890 only 77 per cent. of the adult population could read and write.

Finances.—In the revised budget for 1895 the revenue is computed to be 357,727,028 francs, of which 144,000,000 francs come from railroads, 42,247,409 francs from excise duties, 25,840,570 francs from customs, 34,965,000 francs from the direct property tax, 20,000,000 francs from registration duties, 19,525,000 francs from succession duties, 19,250,000 francs from personal taxes, 16,115,700 francs from funds and securities, 11,687,300 francs from the postal service, 6,900,000 francs from trade licenses, 6,050,000 francs from stamp duties, 6,000,000 francs from telegraphs, 5,803,000 francs from various indirect taxes, and 9,353,049 francs from other sources. The total ordinary expenditure is estimated at 356,193,486 francs, applied as follows: Interest and amortization of debt, 109,790,484 francs; Ministry of Railroads, Posts, and Telegraphs, 106,525,589 francs; Ministry of War, 47,229,652 francs; Ministry of the Interior and Public Instruction, 25,-

925,684 francs; Ministry of Justice, 20,025,684 francs; Ministry of Public Works, Commerce, and Agriculture, 17,670,003 francs; Ministry of Finance, 16,282,495 francs; civil list and dotations, 4,830,760 francs; gendarmerie, 4,484,650 francs; Ministry of Foreign Affairs, 2,552,682 francs; repayments, 1,545,000 francs.

The public debt, which was contracted for useful works, consisted in 1893 of 34-per-cent. loans amounting to 1,299,935,457 francs, and 3 per cents amounting to 643,292,735 francs, besides 219,959,632 francs paying 24 per cent., forming Belgium's share of the old debt of the United Netherlands, and 20,000,000 francs of treasury warrants; total, 2,183,187,824 francs.

A bill for the conversion of 34-per-cent. *rente* into 3-per-cent. stock was adopted by the Chamber on Feb. 13, 1895.

Communications.—On Jan. 1, 1894, there were 2,018 miles of railroads in the Government system, while 792 miles were worked by companies. The receipts of the Government lines were 145,608,902 francs, and the expenses 81,969,346 francs. The capital cost of the state lines was 1,941,283,473 francs.

The Government telegraphs in 1892 had a total length of 4,617 miles, with 22,739 miles of wire. The number of messages in 1893 was 8,311,900; receipts were 3,450,770 and expenses 5,136,385 francs.

The post office in 1893 handled 102,307,722 private and 19,103,155 official letters, 40,195,766 postal cards, 80,579,743 printed inclosures, and 108,221,087 journals; receipts were 18,276,628, and expenses 10,178,073 francs.

Commerce and Industry.—In the general commerce the imports in 1893 were valued at 2,810,709,742 francs, and the exports at 2,590,261,736 francs. The imports for domestic consumption were 1,575,100,000 francs, and the exports of articles of Belgian produce and manufacture were 1,234,300,000 francs in value.

The principal special imports and their values were: Grain, 254,276,000 francs; textile materials, 175,845,000 francs; chemicals, drugs, and dyes, 88,921,000 francs; timber, 67,693,000 francs; gums, resins, etc., 67,128,000 francs; oil seeds, 64,283,000 francs; minerals, 61,630,000 francs; tissues, 58,166,000 francs; coffee, 53,616,000 francs; hides, 52,166,000 francs; live animals, 50,877,000 francs; animal products, 41,848,000 francs; metals, 40,797,000 francs; yarns, 29,078,000 francs; fertilizers, 23,243,000 francs; wines, 22,218,000 francs; fish, 21,139,000 francs; flour, 20,306,000 francs; coal, 18,477,000 francs; machinery, 15,333,000 francs; butter, 15,298,000 francs; tobacco, 12,781,000 francs.

The values of the leading domestic exports were: Yarns, 101,403,000 francs; coal and coke, 96,555,000 francs; grain, 89,547,000 francs; textile materials, 82,737,000 francs; machinery and vehicles, 70,715,000 francs; tissues, 61,403,000 francs; chemicals and drugs, 54,334,000 francs; leather and hides, 51,015,000 francs; glass, 49,438,000 francs; iron, 46,131,000 francs; steel, 38,168,000 francs; animal products, 34,312,000 francs; zinc, 32,606,000 francs; minerals, 30,629,000 francs; meat, 28,268,000 francs; fertilizers, 27,817,000 francs; horses, 18,873,000 francs; resins and bitumen, 18,313,000 francs;

dyes and colors, 16,680,000 francs; flour, 12,517,000 francs.

The values of the special imports from and exports to the principal commercial countries were, in francs, as follow:

COUNTRIES.	Imports.	Exports.
France.....	278,423,000	310,256,000
Great Britain.....	197,986,000	241,912,000
Germany.....	180,180,000	800,970,000
Netherlands.....	200,601,000	177,114,000
United States.....	184,950,000	50,844,000
Russia.....	97,642,000	17,182,000
Argentine Republic.....	83,631,000	14,980,000
British India.....	71,312,000	14,940,000
Roumania.....	65,146,000	8,874,000
Sweden and Norway.....	50,145,000	15,826,000
Brazil.....	37,771,000	17,995,000
Italy.....	20,896,000	24,642,000
Spain.....	18,575,000	18,758,000
Switzerland.....	8,504,000	28,299,000
Peru.....	26,419,000	717,000
Chili.....	18,216,000	8,838,000
Australia.....	18,209,000	8,571,000
Egypt.....	4,879,000	14,259,000

About two thirds of the surface of the kingdom is arable. This land is divided into small farms and is kept in a high state of cultivation. The yield of winter wheat is 26 bushels an acre; of sugar beets, 35,182 kilos. The coal produced in 1893 was 19,411,000 tons, valued at 181,406,000 francs. The iron and steel product was 745,264 tons of pig iron, valued at 26,052,000 francs; 485,021 tons of manufactured iron, valued at 61,873,000 francs; 273,113 tons of steel ingots, valued at 22,929,000 francs; and 224,922 tons of steel rails, valued at 28,868,000 francs. The value of the zinc produced was 39,602,000 francs. The product of sugar, 190,312,000 kilos.

Navigation.—During 1893 there were 7,022 vessels, of 6,001,968 tons, entered, and 6,977, of 5,939,502 tons, cleared at the seaports of Belgium. More than one third of the arrivals were from British ports, and more than one half of the departing vessels cleared for England. From the United States 273 vessels arrived, of 567,721 tons, while 233, of 540,093 tons, were destined for the United States.

The merchant navy in 1893 consisted of 6 sailing vessels, of 1,039 tons, and 50 steamers, of 74,499 tons.

Legislation.—The outcome of the elections held under the new Constitution granting universal suffrage was a strong Catholic majority pledged to restore the system of religious education in the elementary schools, to introduce a protective tariff for the benefit, in particular, of the agriculturists, and to legislate for the amelioration of the condition of the working classes. The Liberals, who represented the principles of secular education, free trade, and economic *laissez passer*, were reduced to a small and impotent minority. The workingmen, represented for the first time, had sent a strong band of ardent Socialists, who agreed with the Liberals on the school question and whose views of social reform, on the other hand, were making progress among the Catholic population, which made the ministry sensitive to their criticisms of its policy toward workingmen. On Jan. 25, the Socialist leader, Anseele, denounced the manufacturers of Ghent for their treatment of their work people, and accused the Government of having one law

for the rich and another for the poor. M. Eeman, in reply, described his invective as the speech of a madman, and was called to order by the President, M. de Lantsheere. The Left rose in approval of this ruling, while the Right remained seated, whereupon M. de Lantsheere resigned the office which he had filled for more than ten years. M. Beernaert, the Liberal leader and ex-Premier, was elected to the vacant post on Jan. 30 by 92 votes against 46 given by the Socialists to M. de Lantsheere.

The Socialists and all the groups of the Opposition were roused to hostility by a new communal electoral law, submitted on Feb. 26, that was the first step of the Conservative Government toward a policy of reaction. It fixed the limit of age at thirty years, the same as for senatorial elections. The plural vote was maintained, with added restrictions in favor of the property-holding class. Instead of giving an additional vote to every householder assessed at 5 francs a year, the limitation was made to vary from 5 to 20 francs in the various communes. This provision was afterward modified, but one was maintained that gives a supplementary vote to the owner of land yielding a revenue of 150 francs or over, provided he has not 4 votes under the other qualifications. In cases where candidates for all the seats to be filled do not receive an absolute majority of votes it was proposed to apply the principle of proportional representation instead of holding a second ballot. A residence of three years in the commune is required. The Christian Democrats held monster meetings to protest against the undemocratic law, and the Labor Congress passed a resolution in favor of a general strike. The miners of the Liège district, who had already begun to strike for a rise of 15 or 20 per cent. in their day's wages, varying from 44 to 2½ francs, went into the political strike, which became so bitter that strikers shot at the police with revolvers, and the police fired into the mob, wounding many people and killing some. The strike would have become general had not the Socialist party in the Chambers disapproved and the Socialist Congress at Antwerp condemned political strikes altogether. The Government accepted an amendment to the electoral bill, offered by M. Helleputte, leader of the Christian Democrats, by which the taxpaying qualification was made 5, 10, and 15 francs for communes containing respectively under 2,000, from that to 10,000, and over 10,000 inhabitants, and that additional communal councilors should be chosen among masters and workmen by the electors of the councils of industry. At the close of the debate on the bill the leader of the Liberals, M. Ans-pach-Puissant, declaring that he shared the convictions neither of the Right nor the Left, nor even those of his own party, felt bound to surrender his mandate. The bill was passed on April 3 by 92 votes to 8, the Left having withdrawn before the vote was taken.

The Government was seriously embarrassed in dealing with the question of the annexation of the Congo Free State by the opposition roused throughout the country by the Radicals and Socialists. The Progressists and a part of the Clericals, who were averse to the project, urged that the country should de-

cide by means of the referendum. The Labor Congress, which met in Brussels on Feb. 24, passed a resolution condemning annexation. The question was referred to a committee of Parliament and was there shelved. Owing to this timid procedure the Comte de Merode resigned the Ministry of Foreign Affairs. M. de Burlet on May 25 assumed the portfolio of Foreign Affairs, while M. Schollaert, a Deputy, became Minister of the Interior and M. Nysens Minister of Industry and Labor. The debate on the Government tariff bill was begun on May 9. It placed a duty of 2 francs per 100 kilos on flour and on malt, one of 50 francs on chocolate, 25 francs on biscuits containing over 15 per cent. of sugar, 15 per cent. *ad valorem* on cutlery, heavy duties on butter and margarine, a duty on cotton, and one on silks, etc. The Liberals arranged demonstrations in Antwerp and other towns against the new duties, especially against those on flour and margarine. The Socialists, led by M. Vandervelde, resisted the taxation of these articles of food; otherwise they took the attitude of indifferent spectators of a struggle between industrial and agricultural capitalists. The bill was passed in the Chamber on June 25 by 78 votes to 64.

M. Lejeune, late Minister of Justice, brought up the question of the alarming increase in the consumption of spirits, which had risen from 12 litres for each adult in 1851 to 48 litres, the revenue from the excise having mounted from 4,000,000 to 33,000,000 francs and the number of drink shops from 53,000 to 175,000. He declared that the country was reverting through alcohol into barbarism, criminality having increased 200 per cent. and insanity 138 per cent., and that 80 per cent. of the deaths of adults were connected with the abuse of alcohol and were due to the insufficiency of the food procurable by the working classes and to the poisonous quality of the spirits that were sold. The establishment of the licensing system and the suppression of 38,000 drinking places had done nothing to stay the increase in the consumption of liquor, for as many illicit establishments had sprung up in the place of those that were suppressed. A commission, of which M. Lejeune was made president, was appointed by the Government to inquire into the causes and the extent of the ravages produced by the abuse of alcohol, and to report on the means of checking the evil.

After the protective duties were adopted the Government brought forward its school bill making religious education compulsory. All the Liberal elements of the country protested against reverting to the educational system of 1842, and the votes on the various clauses were accompanied by scenes of tumultuous disorder. Under the system of education introduced by M. Frère-Orban in 1879 education was made free and undenominational, although religious instruction might be imparted to particular pupils by the desire of their parents. When the Clericals returned to power in 1884 they allowed communes to substitute Church schools for the state schools or to maintain them alongside of the latter. The purpose of the new school bill was declared by M. Schollaert to restore to religion in all primary schools the place of honor

that belongs to it by right. It provided for the teaching of religion and the principles of morality in every public school, and placed such teaching under the control of the ministers of the different faiths. Parents who object to the form of religious instruction in any communal school have the right to have their children exempted from attendance during the hours when religious instruction is imparted.

The Liberals, Radicals, and Socialists arranged popular demonstrations against the bill that were almost as fervent as those that compelled the adoption of universal suffrage. The change in the school law was denounced as a violation of the clause in the Constitution that forbids the Legislature to seek to penetrate into the consciences of citizens with a view to appreciate their conduct by their adherence to one or another religious faith or by their profession of none at all.

The law, as finally enacted, provides that the local authorities in each parish shall determine the number of schools and teachers necessary; but no school can be closed or vacancy left unfilled without the consent of the Minister of Education. Instruction is obligatory in religion and morals; reading, writing, and arithmetic, including weights and measures; the elements of the language of the district, French, Flemish, or German; geography and Belgian history; rules for the preservation of health; and drawing, singing, and gymnastics. In addition to these branches girls must be taught to sew and boys in rural districts must receive instruction in agriculture. The parish clergy must either personally impart the religious instruction that is given in the first or last school hours of each day or superintend it, and the bishop appoint inspectors who visit the schools and supervise the instruction in religion and morals. Parents have a right to free their children from religious instruction. Clerical and private schools receive the same subvention from the state that is given to the communal schools if they have a sufficient number of pupils and classes conforming to the standard.

BICYCLES. From the earliest ages one of man's greatest desires has been to rival the swiftest animals in their progress over the ground or the flight of birds in the air. This is seen first in his conquest of the horse, and next in the efforts to fly, which last attempts have brought misery on foolhardy inventors from time immemorial. A machine to go on wheels and be propelled by the feet was devised by Baron Drais early in this century, and was called a *draisine* (see "Annual Cyclopædia" for 1884, page 80). Ten years ago bicyclists were content to ride on what was called the "Ordinary," a bicycle that had one high front wheel and one little, almost tiny, rear wheel. This permitted one to travel at a wonderful rate compared with anything that had so far been achieved, but it was fraught with danger. The invention of the "Safety," a machine that has two wheels of equal or nearly equal size, depending for power on a chain gearing, was what practically conquered space so far as the bicycle-riding world is concerned, and gave even ladies and children an instrument on which many of them can develop a speed surpassing that of

thoroughbred horses. There were two factors of almost equal importance in the wonderful speed records attained by the new Safety bicycle that has occasioned such a *furor* in this sport. The one that played almost as important a part as the chain gearing and the low wheels was the introduction of the pneumatic tire. This was invented in England half a century ago. It was tried there for wagons and carriages, but was a failure. On the introduction here of the pneumatic tire, the popularity of the bicycle was established at once. It has become a feature of common life in all civilized countries. Not only do all classes of society use it for pleasure and exercise, but it has been made useful to deliver the mails, in the army, on the police force, for the delivery work of messenger boys, even in such a crowded city as New York; and, with the application of power that is now being tried for the doing away with the working of the pedals by the feet, it is believed that its usefulness has practically no limit. The riding-academy business in New York has been changed into a bicycle-school business, and the letting of horses and light wagons has been as much diminished by the popularity of the bicycle as the sale of horses in New York for the horse-car lines has been hurt by the advent of the cable roads. On the other hand, sporting-goods establishments that barely existed have, through the demand for the bicycle, become important mercantile houses; and while hundreds of new factories and stores have been started, the importance of the trade is perhaps better shown by the entrance into it of some of the largest sewing-machine and rifle-manufacturing establishments in the country. There are in America 130 large bicycle manufactories, while counting the concerns that turn out only 50 to 100 machines a day the number rises to nearly 300.

During 1895 these 300 factories turned out 500,000 machines of all sorts, from the light and graceful ladies' bicycles to the heaviest ones for large men seeking to reduce their weight. The astonishing thing about these latter bicycles is that now a heavy machine only weighs about 22 or 24 pounds, while a few years ago the best racing bicycle made scaled over 60 pounds. A fine racing machine now will not weigh over 16 pounds. The cost of bicycles has come down in the last few years, till the average cost of these 500,000 machines to the user is about \$75, or a total of \$37,500,000. And with all this enormous production, the supply is unequal to the demand. Although a bicycle is guaranteed for the first year, like a watch, each purchaser spends, on an average, half as much as his machine cost him in the first six months on all sorts of improvements, and twice as much more for extras. A bicycle is almost as good a thing for business and the promotion of industry in a country as horse-and-carriage keeping. Rubber tires wear out. Spokes get twisted in accidents, new air pumps are wanted, there are always a hundred little nothings for the machine, all of which means so much more money to the maker, for all the makers manufacture the accessories. Then the rider has need of a list of extras long enough to frighten any but a prodigal. It is estimated that in a factory that can turn out 30,000 bicycles a year, over 800 persons, mostly full

grown men, are employed. A recent estimate of the machines likely to be made in the United States during 1896 puts the number at 800,000. These bicycles will, as a general thing, be a little heavier, as regards the wheels, as the manufacturers in the past two years have done more to secure lightness than strength, and customers are now asking for a somewhat stronger wheel, even at the expense of a little weight. The bicycle has been made to a great extent on the plan of the sewing-machine and the typewriter—that is, on an agreed-upon basis of sale price; but now the competition is so great that the price of a good wheel will soon come down from \$100 to about \$45.

To describe the modern bicycle is to try to follow a bullet in its flight. No such perfection of strength and lightness combined has appeared before. The principal departure in the Safety bicycle is the changing of the application of the motive power from the front to the rear wheel. Until the Safety was brought out the power was applied direct by means of pedals on the front wheel. The Safety type depends for its power on pedals connected by a chain with the rear wheel. When the Safety was first introduced, the racing officials required the riders to pass the winning line with the rear wheel in front of the fore wheel of an Ordinary, to score a victory. Soon it was discovered that much more of a handicap than this would have to be accorded the Ordinary if it was to be raced against the Safety. A Safety bicycle is a velocipede with front and rear wheels of the same size. These wheels are each about 28 inches in diameter generally, and the favorite "base line," as it is called, for the modern bicycle is 44 inches. The base line of a bicycle is the distance from the outside circumference of the forward wheel to the farthest point on the rear wheel. These wheels are made with wooden tire rims, to which are fitted the pneumatic tires. The spokes are of fine and wonderfully strong steel wire. Each of these wires is secured in the wooden tire with a small nut at the axle, where it goes through a steel frame, and is then run to another point in the wooden tire, crossing another steel-wire spoke on the way. One of the most interesting points to notice in the construction of the bicycle is the ball bearings, of which there are 12. These ball bearings make a bicycle as near frictionless as is possible. A ball bearing is a cup fitted for an axle to run through and provided with a half dozen or more solid steel balls. For some bearings these balls are not larger than small shot, for others they are as large as buck-shot, while now and then for the heavier bearings even larger balls are used. A line of these tiny balls is fixed in the outer edge of the bearing cup, and they are well oiled. The axle runs directly on these little balls, each of which revolves freely, and the friction is so slight that a wheel held up and set running by a quick motion of the hand will sometimes run several minutes before coming to a complete standstill. There are ball bearings in both front- and rear-wheel axles, and in the handles and steering gear, as well as in the

pedals. The power is applied by means of a chain connected with the axle of the rear wheel. This chain runs over a sprocket wheel on which are hung the pedals, and is strung at a high or a low tension, according as the rider wishes to go rapidly or have the power of climbing hills. To go rapidly on a level surface the chain may be tightened up to the last notch, but to climb a hill it must be hung loosely. There are two devices for effecting the change in the chain from high to low, and vice versa. One of these is a bar or lever throwing the chain off from one axle wheel and upon another; the second is a change in the wheels themselves. The objection to the first-mentioned plan is that it leaves too much space for the dirt and dust to gather between the wheels at the axle. The trouble with the second plan is that it is not convenient to carry a spare wheel always with one on a tour, much less on a short pleasure ride. The frame of a bicycle is made of the best hollow steel tubes. Aluminum is now much used, as it gives greater strength with the same weight. Over the framework in front are the handles or steering gear. These are of various shapes and designs, according to the class of the bicycle or the purpose for which it is intended. The handles are provided always with a brake and a rubber alarm. Not long ago there was a crusade against bicyclists riding at night without lights. A small oil lamp is sold with every bicycle, and its use is as much to the advantage of the rider as to the foot passenger or the driver he encounters. The best weight for the bicycle at present is considered to be about 24 pounds. The frame of a ladies' bicycle is bent in and down at the upper bar or tube. This enables women to ride without using bloomers or other special costume; but many ladies prefer the man's bicycle, and have adopted costumes in keeping with the idea. The saddle of the bicycle is considered to be a long way from perfection. The most favored idea at present is the pneumatic saddle. Ladies, in particular, have found much fault with the ordinary saddle, complaining of fatigue from the use of the saddle more than from the long ride or other causes. Several experiments that have been tried in the way of saddles have been unsuccessful. Riders and physicians have complained loudly of the injurious effects caused by riding

FRONT HUB AXLE AND BEARINGS, SHOWING THE BALLS.

upon the ordinary leather saddles. These saddles rely solely upon the lateral tension of the leather of which the seats are constructed to retain their shape. The teaching of experience has been that while the saddle is being ridden the weight of the body so alters its shape as to render it highly injurious to the rider. The bony prominences of the pelvis, which must support the weight of the body while it is in a sitting posture, are about 4 inches apart, and

they, as to speak, straddle the leather, and this leather yields and forms a ridge. The latest saddles to a certain extent overcome this difficulty, being modelled in anatomical conformity with the lower parts of the human body. The frame of one of the best saddles is made entirely of metal and weighs about 16 ounces.

THE LATEST IMPROVED SADDLE.

The cushions rest upon a perforated base, insuring a circulation of air through the horn of the saddle, and as cool a seat as possible under the circumstances. The pads of these saddles are removable.

After the chain gearing the prominent feature of the modern bicycle is its tire. The present pneumatic tire was just coming into use as an experiment in 1890, and in 1891 it had started fairly on its way. The pneumatic tire is the result of experiments to obviate the jar to which the rider was subjected, which sometimes had seriously injurious effects in case of long rides. Many physicians even advised against the riding of the bicycle, if this vibration could not be done away with, particularly in bicycles for ladies. It was admitted that the principal cause of fatigue after a bicycle ride was this jar or vibration experienced during the journey. The earliest effort to meet this difficulty was spent upon the fork to the forewheel axle. Coiled springs were fitted to the bottoms of these forks in the machines at the exhibition held in London in 1889. Other steel springs were placed in the steering post, to prevent the vibration of the handle bars. The most successful of the devices tried was a spring fork on which the two front forks were curved. This was very springy, giving a comparatively pleasant motion to the wheel and greatly reducing the vibration. But the best authorities were beginning to see that the place to get at this vibration and minimize it was at the point of contact of the bicycle with the ground, and this led to the search for a new tire that should be more springy than the solid rubber ones already in use. Up to 1890 the ordinary size of a solid rubber bicycle tire was $\frac{3}{4}$ inch, but hollow rubber tires as large as $1\frac{1}{2}$ inch were already making their appearance. The pneumatic tire, like many great inventions, was at first looked upon as a clumsy, stupid thing, of little or no practical value. It was a stout rubber tube 3 inches in diameter, fitted on the tire of a bicycle and inflated with air. It was an

Irish invention, and the first wheels that were equipped with it had to make, so their detractors said, frequent excursions to Dublin. The new pneumatic tires had to be inflated with compressed air, which was in itself a great inconvenience; but the chief difficulty was in their likelihood to injury from contact with all sorts of hitherto unconsidered foreign surfaces, such, for instance, as bits of broken bottles and sharp stones. The rubber of which the tires was composed was porous, and this added another difficulty, for the air gradually filtered through the tiny holes and the tire had to be refilled from time to time. This was done with a small pump constructed for the purpose. But soon it was found that the newly equipped machines were much faster than the old style and withal went with a smoothness of movement hitherto almost un hoped for. The breaking of the records began anew with the invention of the pneumatic tire for bicycles, for a Safety thus equipped was as superior to the old style as the first Safety had been to the Ordinary. The pneumatic tire began to be looked upon as the nucleus of a grand idea. Early in 1892 the pneumatic was an accomplished fact; it had come into vogue, and soon no bicycle was complete without it. In the last months of 1892 there was as little use for an ordinary solid tire on a Safety bicycle as there was sale for an Ordinary, big-and-little-wheel bicycle of a few years before. At this time Ordinary bicycles, such as had been sold for \$150 to \$300, were a drag at \$10.

A perfect pneumatic tire is the harnessing of compressed air by such means and in such a manner as will least affect its perfect resiliency and at the same time maintain that rigid connection between the rim of the wheel and the surface over which it travels, without which the power can not be transmitted without loss and the highest working efficiency attained. The method of constructing such a tire is briefly as follows: Upon a pure gum tube are wound spirally 2 layers of thread, each thread imbedded in rubber and out of contact with its neighbors, the 2 layers separated from each other by a wall of pure rubber and wound at an angle of 45° to each other. A seamless, endless, spirally laid tube is thus made, meeting all the required conditions and giving a tire unequalled in strength, speed, and durability, in combination with, and at no expense to resiliency. The most difficult of the many problems connected with the bicycle is the construction of the pneumatic-tube tire. There are over 100 threads spirally wound in an ideal tire; they extend the whole length of the tire, and, as they are imbedded in an elastic body, any inequality in tension adjusts itself. The threads must be non-stretching and laid at a tangent to the rim of the wheel for speed and power, and they must be free to move over each other without friction for perfect resiliency. Resiliency in a tire is defined as the property of returning to the original shape with the same force that was used in depressing it. By this property the momentum lost by a rider in striking a stone is given out again as the obstacle is passed. It has been found that easy riding or absence of vibration is obtained in the greatest degree by such construction as admits of the tread of the tire

stretching in the direction of its length with the least resistance possible. A recent improvement in the pneumatic tire is in the manner of attaching the valve through which the air is pumped. A thick washer of soft rubber is interposed between the metal base of the valve and the inner tube of the tire. This improvement precludes the possibility of the inner tube being cut by the base of the valve, and as the slightest pressure only is necessary to secure an air-tight joint, there is no danger of the fabric's being torn by the outer plate.

The best idea of what the Safety and the pneumatic tire have done for bicycling speed may be obtained from a glance at some of the records. In 1881 the best record for 1 mile was that held by Frye, three minutes twelve and a half seconds. In 1895 Lawson rode a 5-mile race at Chicago, making the distance in eleven minutes thirty-three and two fifths seconds. Lawson's fastest mile was his second, which he covered in two minutes fifteen and one fifth seconds, while his slowest mile, his fourth, was finished in two minutes twenty-two and one-fifth seconds. Since this race the 5 miles have been done in ten minutes eighteen seconds, 10 miles inside of twenty-three minutes, and longer distances at similar rates. It is difficult to quote records accurately, for in one week may come reports from England, France, or the West, surpassing all previous performances. Then, too, these records are not always allowed by the governing boards of the wheelmen, and such a number of conditions are considered in the performances—such as the wind at the back, paced or unpaced, and standing or flying start—as well as the authenticity of the track measurements, that it is well into the following year when a correct table of records may be compiled for the year preceding. One of the most sensational records, which proves what a wonderful machine the bicycle as lately improved is, is the comparison that may be made between the steel horse and the one of flesh and blood. The fastest record of the running turf is that of great Salvator, who ran a mile against time to beat the time made by Ten Broeck, also a record made against time on a specially prepared track. Ten Broeck's record was one minute thirty-nine and three quarter seconds. Salvator astonished the world by doing a mile on a straightaway track in one minute thirty-five and a half seconds. There is at present a record awaiting recognition of a bicyclist having made a mile on a straight track in less than one minute thirty-five seconds. There is an authenticated record of a mile to Safety bicycle over a straightaway track in better time than the champion thoroughbred horse Salvator did it. This is Johnson's fast mile at Buffalo in 1894 in one minute thirty-five and two fifths seconds. The best road race time for 25 miles in 1894 was one hour fifty-nine minutes. Twenty-five miles have been ridden on a bicycle on a track, in 1894, in fifty-six minutes four seconds, and in 1895 in fifty-five minutes six seconds. The best one-hour record for 1894 is 26 miles 1,489 yards. The best record for 100 miles in 1894 was three hours fifty-four minutes twenty-nine and two fifths seconds. The best twenty-four hour record in England is 469 miles 1,296 yards. This has been beaten in France, where

Constant Huret rode 520½ miles in twenty-four hours. The road record from Chicago to New York city is held by R. P. Searle, who covered this distance in five days twenty-three hours fifteen minutes.

As soon as the pneumatic tire was appreciated the fact was recognized that its one tremendous disadvantage threatened to be so serious a handicap as to throw it out of the race with the solid tire unless a remedy could be promptly found. This defect was its liability to injury. A pneumatic tire that could take the rider of a bicycle more noiselessly, easily, tirelessly, and with almost none of the jar that was still only too apparent with the best solid rubber tire was certainly a great thing; but a machine equipped with a pneumatic tire lost its charm when its rider found himself miles from home with a punctured tire from riding over a sharp stone, a tack, or some carelessly exposed bit of glass. The efforts to supply this deficiency afford a cumulative record of American ingenuity. The inventors first tried every way to render the rubber unbreakable, punctureless, proof against the onslaughts of tacks, sharp stones, wire, and bits of glass. The efforts in this direction all left the bicycle improved on these lines, capable of resisting to a certain extent the injuries it was aimed to guard against, but they did some undesirable thing in its place. The first effort to prevent the pneumatic tire from bursting when punctured along a road that promised better success was the attempt of the men in the rubber business. Rubber is very elastic. What more simple, then, than to have the pneumatic tires made of so nearly pure gum that they would close up and come together over the puncture of a tack? This was at first hailed as a sure remedy, and it acted well for a time. The objection was, that the rubber of which the new tires were constructed was as unserviceable as gold unalloyed. The new tires wore out too quickly. A half dozen schemes in the direction of a tire that would heal itself were tried before this plan was given over. Then began a long series of experiments in the direction of securing a pneumatic tire that would be tough and strong without being too heavy. The hollow rubber tires were coated with all sorts of preparations to render them impenetrable. Most of these coverings, with the idea of lightness always in view, were in the form of liquid. One inventor got up a horsehide covering, which had a certain success until the cold weather set in, when it was found to be too slippery. A bicycle provided with a horsehide covering for its pneumatic tire could go on very well, and was not much heavier than one without this protection in summer, but in winter the ice and frost of the climate of New York rendered the horsehide as slippery as so much glass, and no rider, even the most expert, had any chance of staying on his wheel. After the horsehide came the idea of a covering within. The tube was coated inside instead of outside with all kinds of preparations. The most successful of these attempts at interior protection was a strip of cloth called "punctureless armor." The idea of this punctureless armor was that it would lie in the bottom of the tube, and in case the rubber was punctured it would at once fill up the hole and prevent the escape

of the air. This strip of cloth was toughened by immersion in liquids till it was capable of resisting a good strong prick from a tack. This armor was put inside the tube before it was inflated and might stay for some time in position. The main difficulty was, that it could not be held in position at the bottom or top of the pneumatic tire, and sometimes a rider found, after days of uselessly carrying the extra weight, that his inside armor would slip and afford no protection when the outer tire was punctured. When ingenuity had exhausted itself in finding methods for toughening and strengthening, and at the same time keeping light, the pneumatic tires on which so much of the success of the modern bicycle depended, a step was at last taken in the right direction. The master stroke was a casting aside of all efforts to make the rubber withstand the cuts and blows to which its use subjected it and boldly taking an entirely different tack. As soon as the inventors stopped trying to get resistance out of a thing that could not be made a resistant body, and set to work trying to make the rubber tires not resistant but capable of being mended speedily, success smiled upon their efforts. There were three efforts also in this direction before the thing could be regarded as settled. A last attempt at the quick mending of breaks in bicycle tires by electricity has not yet been sufficiently tried to be fairly judged. The first attempt to mend the punctured tires was in supplying to riders a tiny pair of pinchers, with a small awl that could be

The plug was to be put in big end first, and the stem coming back through the hole could be trimmed off to fit. The difficulty with this arrangement was the amount of mechanical skill required. The improvement on this first rude attempt at the speedy mending of an injured bicycle tire was a neat and ingenious little contrivance something like a corkscrew. This had an oblique opening at one end, and its chief claim as an improvement was that it had the awl in the hollow of the handle. With the awl thus secured, and certain of working properly, the rubber plug was driven home to its position much more quickly and certainly than the former appliance did the work. One of the latest repairing tools effects

heated red hot, a little book of rubber plugs (something like a fly fisher's book of flies), and some powerful liquid glue or cement. With a small hand pump for refilling a burst tire, a rider might now go on a long trip and feel reasonably certain that, even if he did have the mishap to prick his tire in some out-of-the-way place, the chances were that the injury could speedily be repaired, at least sufficiently for him to proceed on his journey and get home that night. With the set of tools spoken of, the mode of procedure was as follows: When the tire was punctured the rider dismounted and examined the injury. If it was a simple puncture, with a smooth inner surface, he need not trouble to beat the awl, but could proceed at once to patch the wound with his rubber plug. This rubber plug looked like a tiny toadstool. It was inserted with the pinchers or pliers after being carefully folded and covered with glue. The theory of this plug is that the pressure of the air from the blown-up pneumatic will hold it in place once it is secured in the puncture, with the head inside,

a reparation almost with the turn of the wrist. It is a little instrument about six inches long and has, like the others, the object of inserting and securing a tiny rubber plug where a hole in the tire has been made. The tool shown in the accompanying illustration is the instrument with the repairing plugs. Fig. 1 shows the tool as carried in the tool bag or in the pocket. Figs. 2 and 3 show the tool separated. Fig. 2 shows the divided plunger in which the stem of the plug is inserted. Fig. 4 shows the tool locked together, with the rubber plug inside the pointed expander, which is inserted in the puncture. Fig. 5 shows the plunger forced through the puncture inside the pointed expander, with the plug carried through and inside the tire. Fig. 6 shows the tool withdrawn, leaving the plug in the puncture with the head of the plug inside of the tire and covering the puncture. Fig. 7 shows the stem of the plug cut even with the surface of the tire, making the repair complete. It is always well in repairing punctures not to use any larger plugs than are absolutely necessary.

the object of this being not to increase the size of the puncture. The very latest in bicycle repairs is a device just placed upon the market by a Western company. It is a contrivance for repairing tears or punctures in any kind of tire. The hole to be repaired is filled with new material, and the part then subjected to the vulcanizing effect of heat generated by electricity, under the influence of which the new and the old materials are united. This machine is small, the combined heater and regulator only occupying a space 3 feet long by 7½ inches wide. The heater plates are 2 by 12 inches each, so that from 1 to 8 tires can be repaired at the same time. This latest device may be connected with any incandescent-light circuit. The machine was originally got up to enable a jobber in tires to make repairs in his shop on tires returned under his guarantee, and was found to do work in the most satisfactory manner. It is claimed that by this latest process uncured or partially vulcanized rubber and the necessary fabric and friction duck are placed in and around the hole to be patched, and it is then to be filled in with materials prepared for the purpose, which, when vulcanized on the machine, make a smooth, even job, exactly the same as could be done in the factory where the tire was originally made.

One of the causes of the fast time credited to bicycle experts in the recent efforts is due to the excellence of the tracks. The best style of track is considered the elliptical. The knowledge of the elliptical track was borrowed from the trotting-horse circuits, as was the idea of thrown-up turns. This was only a fair return, for the trotting-horse people borrowed the pneumatic tire from the bicyclists, and by doing so reduced the records of trotting horses at once, and wonderfully. The result of years of careful study and experimenting in the construction of bicycle tracks can be seen at Manhattan Beach, where Austin Corbin spent \$60,000 to produce a perfect track for bicycle racing and for the daily practice of the constantly increasing patrons of this popular sport. The Manhattan Beach track is one third of a mile round, which is the most favored by bicyclists because, while a third of a mile is enough for a good swing, it is not too large, and does not let the racers get too far from their audience. Then, too, the turns can be thrown up better or oftener. And this is quite an advantage, for the bicyclist really comes to depend on the enormously thrown-up turns more than he himself believes. A thrown-up turn of 6 feet or more on the outer edge is a great help to a speeding bicyclist. The power developed is not only a rest for the few seconds spent on each of the turns, but the throw-in really helps to send the wheel along. The track at Manhattan Beach is composed of 8 inches of ashes and concrete, and 4½ inches of crushed granite, powdered cement, and sand. The outer bank of this track is thrown up 6 feet ¾ inches. At first view, this great incline would make a rider hesitate; but if he hesitates, he is lost. The power of remaining on his bicycle depends on his keeping on at a high rate of speed. This track has a grand stand capable of seating 8,000 persons, and there are also 3,100 folding chairs.

The art of sitting on a bicycle is not so difficult as most people suppose. One can learn to

ride passably in a very few lessons. In the large cities it will be found best perhaps to go to a school where for a fee of 50 cents an hour, or 5 lessons for \$2, one can learn well enough to go out alone. In case of learning out of doors, with a friend instead of a professional instructor for a teacher, a smooth level piece of road should be chosen. The friend should steady the machine, for at first even a Safety seems the giddiest thing imaginable and at least a mile high. The friend steadies the machine by the handle bar while the learner mounts, and as soon as he is seated the friend should place one hand under the saddle while retaining his grasp of the handle bar. In this position he can completely control the machine, and render a fall the next thing to an impossibility. If a violent or unexpected swing or lurch comes, simply let go of one pedal, and, putting out one foot, save yourself by keeping in an upright position by means of the ground. One of the most important things in learning to ride a bicycle is not to grasp the handles too firmly. Frequent rests should be taken, and not more than from 15 minutes to a half an hour consumed at any one of the earlier lessons. A bicycle is maintained in its upright position through its momentum, and the tendency of all rotating bodies to continue as started unless interfered with. It is a mistake to depend too much on the steering crank or handles to keep up. After one has acquired a perfect balance, the bicycle will keep up of itself, aided now and then by an almost imperceptible motion of the steering handles, which will turn the front wheel in the direction you would fall, thus re-establishing the equilibrium. The natural impulse of a learner is to turn the wheel away from the direction in which he is inclining. This is a case in which the natural instinct is at fault, and learning to ride a bicycle is simply learning to overcome this first impulse, and by practice developing a new and different one. To learn to ride by one's self, the pedals should be removed and the saddle placed so low that the learner's feet can be placed flat on the ground. Then grasp the handles, bestride the machine, and get it into motion by pushing on the ground 2 or 3 times with each foot; lift the feet from the ground, and try to steer the machine so that it will continue erect until it loses its momentum. Repeat this for some time, with occasional rests. When you find that you can actually steer well enough to keep the machine erect for a few yards, you can make the work easier by getting a good start, and then putting your feet on the pedals and coasting. It will not require much practice to give you confidence, which is all that is necessary to begin with the pedals. The saddle should still be kept low, so that in case of a slip or a fall the foot may be near enough to the ground to prevent an accident. A woman may learn to ride in a school or on the road as quickly as a man. Capable assistance is especially desirable for women, as many have not much strength, and require considerable help until the exercise has brought their muscles into play and accustomed them to the little exertion required. The first ride out on the road should be, if possible, under the eye of an experienced rider, and must be taken very slowly. Half a

mile is far enough to go the first time. The distance and speed of the daily ride may be gradually increased, and within a fortnight a healthy woman ought to ride 5 or 6 miles without fatigue, and a man at least twice as much.

Men who had long given up all idea of active participation in athletics have taken to riding the bicycle, with the best effect, and ladies have found in the use of the wheel a tonic exercise of the greatest value. The principal charm of the wheel is the fact that one can, in a fraction of the time it would take to walk or even to be driven to a place, go there independently and in a fashion that has all the pleasure of the most delightful transportation imaginable, while at the same time obtaining the benefits of a most healthful exercise. Once a bicyclist always a bicyclist has become a proverb. The more people ride a machine, the more enthusiastic they become and the more they want to ride. One of the most popular forms of amusement at present is road racing on the bicycle. On account of the poor state of most roads in America, this pastime has not yet become what it is in England and in France, where the roads are nearly perfect. Two race courses with a national reputation are the Irvington-Milburn and the Pullman. On Memorial Day the best Western riders enter for the races at Pullman, and the Eastern ones try their speed and endurance at the Orange course in New Jersey. The Irvington-Milburn course is a 5-mile stretch between two villages of these names at Orange, N. J. The road here is smooth but hilly, and often a third of the starters fail to finish the race. The Pullman course is a 14½-mile stretch between Chicago and Pullman. Some idea of the place that bicycling has taken in New York life may be gained from the fact that a bill was recently introduced for the turning of the old aqueduct path into a bicycle track. This bill was passed by both Houses, and only failed to become a law through Gov. Morton's failure to attach his signature.

The League of American Wheelmen was founded in 1890, and now numbers 38,000 members. The president of the L. A. W., as it is always called, is A. E. Williston, of Maryland, and its vice-president is George Perkins, of Boston; but the controlling influence is said to be Isaac B. Potter, of New York, who would be the president of the body but for an amicable suit at law. The objects of the league are, in general, twofold: First, to encourage and aid bicycling by obtaining passage of laws favorable to the sport, by protecting the rights of bicyclists, and seeking to secure better roads all over the country; and, second, to protect the better class of riders from the damage that might be done the sport by unscrupulous professionals. To accomplish this latter purpose, riders are divided into three classes, Class A, Class B, and Class P. The riders in Class A are pure amateurs who have never taught, pursued, or assisted at bicycling or athletics for a livelihood, and only ride for their own amusement. Class B is composed of what are called half-and-half men—for instance, of what are called maker's riders, that is, of young men who, while not actually making their living as bicyclists, go from one country to another partly for the sake of the traveling, and ride a bicycle of a certain make with which they

break records and give exhibitions or compete in amateur competitions, thus furnishing a regular and constantly moving advertisement for the house that pays their expenses and provides them with wheels. Class P is made up of professional bicyclists. The L. A. W. is divided into State divisions, each self-governing.

Great as is the bicycle in America and popular as it is in England, it finds its true home in Paris. That city, with its smooth wooden pavements, is better adapted to bicycling, and 10 Parisiennes ride where one Englishwoman would. In Paris, too, one finds the more practical adaptation of the bicycle principle. Here one sees on all sides the tiny bicycle boys with messages and letters, and the little tricycles with which even the bread is delivered in the morning. The newspaper conditions in Paris are so different from what they are in England and the United States that in the French capital more than one big daily utilizes the tricycle for the delivery to the kiosks and to customers every morning. In England few ladies ride in London, but the bicycle is as popular at the country places as ever. It has become unfashionable to ride bicycles in London, because the cheapening of the wheel has enabled laborers to use it, and the business man who a few years ago went to his office on a bicycle will no longer be seen astride one except on a country road.

BOLIVIA, a republic in South America. The Constitution of 1880 vests the executive power in a President elected directly by the people for four years, and the legislative power in a Senate and House of Representatives, of 16 and 64 members respectively. Every male citizen able to read and write has a vote.

Moriano Baptista was elected President for the term ending in August, 1896. The ministers in the beginning of 1895 were: Foreign Affairs, E. Cano; Finance, E. Borda; Interior, L. Paz; Justice, E. Tovar; War, S. Alonso.

Area and Population.—The estimated area of the republic is 567,360 square miles. The population is estimated at 2,019,549, not including the tribal Indians. La Paz, the capital city, has about 56,000 inhabitants.

Finances.—The revenue for 1892-'93 was estimated at 5,737,200 bolivianos (the boliviano has an exchange value of 42 cents), and expenditure at 5,937,200 bolivianos. For 1893-'94 expenditure was estimated at 5,234,820, and expenditure at 5,721,300 bolivianos. The foreign debt includes a war debt of 1,616,655 bolivianos due Chili. This is being paid off; but on the rest of the debt, amounting to 3,763,273 bolivianos, no payments of interest or principal have been made for a long time. There is an internal debt of 4,484,916 bolivianos.

Commerce and Production.—About two thirds of the exports consist of silver. Other commercial products are tin, cinchona, bismuth, India rubber, and alpaca wool. The value of imports officially given for 1892 was 11,071,000 bolivianos; exports, 21,570,000 bolivianos.

Communications.—The railroad from the Chilian port of Antofagasta has since May 1, 1892, been completed from Ascotan, on the frontier, to Oruro, with a branch to the silver mines of Huanchaca, the total length on Bolivian territory being 500 miles.

The post office during 1892 forwarded 1,238,840 internal and 368,539 international letters, newspapers, etc. Receipts, 384,821 francs; expenses, 417,527 francs.

The telegraph lines have a length of 903 miles. **Quarrel with Peru.**—Toward the close of 1894 the Government protested vigorously against Peru's action in stopping traffic on Lake Titicaca, which had been done for some time, contrary to the terms of the treaty between the two countries. After the election of Nicola Pierola as President of Peru, the dispute was settled, and there was no more interference with Bolivian vessels. Bolivia demanded that Peru should salute the Bolivian flag. This *amende* the Peruvian Government refused to give. Bolivia had been for some time increasing her armed forces, and supplying them with breechloading rifles and artillery, especially mountain guns. On July 9 Bolivia's minister to Peru presented an ultimatum demanding that Peru give satisfaction by a formal salute to the Bolivian flag within twenty-four hours; otherwise the Bolivian minister would quit Lima. The act of a Bolivian mob in stoning the Peruvian consulate in La Paz caused the Government to moderate its attitude. A protocol was drawn up for the settlement of the dispute by arbitration, as suggested by the papal nuncio. The offer was accepted by Peru, and the agreement was signed on Sept. 7, 1895. Brazil was selected to act as arbitrator, or Colombia in case Brazil should decline the office.

The relations between the two republics were strained on account of a question that had arisen in relation to the destination of some of the territory that Chili had retained after the conclusion of her war with Peru and Bolivia. The former Bolivian province of Atacama and the Peruvian province of Tarapaca were definitely annexed. The northern districts of Arica and Tacna, according to the terms of the treaty that was signed in October, 1889, were to be occupied by Chili for ten years, at the end of which the inhabitants should decide by a *plébiscite* to which of the two republics they would belong. The Chilean Government did not hold a *plébiscite* when the ten years expired. It was not until Peru seemed likely to have a stronger and more stable government, after Pierola's accession to power, that Chilean statesmen became alive to the necessity of reaching a final settlement of the status of Tacna and Arica. Chili could not in honor and safety retain them against the will of the inhabitants, who did not seem disposed to elect the Chilean nationality; but she was unwilling to restore them to Peru, and thus aggrandize her old enemy and rival, and make it easier for the Peruvians to regain the rest of the conquered territory. A third solution of the problem was to give the districts to Bolivia, which was already an economic dependency of Chili. By this means Bolivia could be seduced from her old alliance with Peru against Chili, and would become Chili's ally, greatly strengthening the position of that power in a possible war with Peru and the Argentine Republic or with Peru alone. The people of Arica and Tacna would first have to be reconciled to the transfer and induced to accept Bolivian nationality. To bribe them Chilean cap-

italists promised to extend the railroad from Arica to Tacna into the interior, so that it would become an outlet channel for the bulk of the exportable produce of Bolivia. A treaty was drawn up by the Chilean Government whereby Chili was to cede at once to Bolivia a seaport in the northern part of Tarapaca. Chili further agreed to promote the acquisition of Tacna and Arica by Bolivia, on condition that Bolivia pay \$5,000,000 to Chili. This money was to be paid finally to Peru as compensation. Since the Bolivian Government had no such sum at its disposal, Chili offered to advance it, requiring as a guarantee that the control of the customhouses in the seaports that Bolivia would acquire should be intrusted to Chilean officers, and the customs applied to the repayment of the debt until it shall be extinguished.

The people of Bolivia were not won immediately by this alluring proposition, and the majority of the Cabinet were opposed to its acceptance. President Baptista nevertheless declared that he would accept and support the treaty, and would submit it to the Congress for ratification.

BRAZIL, a federal republic in South America. The legislative power is vested in the National Congress, consisting of the Senate and the House of Deputies. There are 3 senators from each State and from the Federal District, 63 in all. The Deputies, elected in the States according to their population, number 205. All tax bills originate in the lower house. Members of both houses are paid. They can not be Cabinet officers unless they resign their seats, and none can accept any office bearing emoluments, except in the diplomatic or military services, in which case he must resign his seat, nor can he become interested in any public contracts or be a director in a private corporation having contracts with the Government. Congress meets annually on May 3 and sits four months. The President, who is elected for four years, has power to prorogue it or to call an extra session, and has a suspensive veto upon legislation.

The President is Prudente de Moraes Barros, who entered upon his office on Nov. 15, 1894. He appointed the following Cabinet: Finance, Rodriguez Alves; Public Works, Antonio Olvinto; Interior and Justice, Gonçalves Ferreira; War, Gen. Bernardo Vasquez; Marine, Admiral E. Barbosa; Foreign Affairs, Carlos Carvalho. The Vice-President of the Republic is Dr. Manoel Victorino Pereira.

Area and Population.—Brazil has an estimated area of 3,209,878 square miles, and an estimated population of 14,254,217 souls. Rio de Janeiro, the capital, had 422,756 inhabitants in 1890. Pernambuco has about 190,000, and Bahia 200,000. The immigration in 1892 was 84,143; emigration, 17,525. The German and Italian colonies in Rio Grande do Sul and elsewhere have been formed of emigrants brought out at the expense of the Government, who are fed and housed until land is allotted to them, when they receive a small sum of money and tools to enable them to build a habitation and begin work. Beginning almost without capital, they cultivate in a primitive manner and make slow progress. The Italians are said to be the more energetic and economical, and to get more out of rugged,

hilly land than the Germans out of rich bottom lands; but the latter settle down and become permanent citizens, while the Italians are inclined to go back to their own country when they have saved some money.

Finances.—The receipts of the General Government in 1893 were 258,835,000, and expenditures 317,467,000 milreis. In 1894 the revenue was 201,568,000, and expenditure 253,473,000 milreis. The estimate of expenditure was 250,457,908 milreis, of which 14,473,833 milreis were for the Ministry of the Interior and of Justice, 100,716,824 milreis for the Ministry of Agriculture, 85,645,244 milreis for the Ministry of Finance, 29,950,815 milreis for the Ministry of War, 17,846,300 milreis for the Ministry of Marine, and 1,815,992 milreis for the Ministry of Foreign Affairs. The extraordinary expenditures were estimated at 116,384,000 milreis. For 1895, receipts are estimated at 270,198,000 milreis, and expenditures at 275,692,000 milreis.

The total debt in 1893 amounted to 1,481,136,784 milreis, less 233,612,484 milreis of assets, leaving a net debt of 1,247,524,300 milreis. The foreign debt was 261,809,111 milreis and the internal debt 649,042,399 milreis, besides which there were 215,111,964 milreis of treasury bonds and 355,173,310 of guaranteed bank notes.

Commerce and Production.—After coffee, of which 8,000,000 bags were produced in 1892, the chief products are rubber, cotton, tobacco, cattle, sugar, and fruits. There were 450,000 cattle slaughtered in 1893, and 575,160 salted hides, 2,592,864 kilogrammes of tallow, and 24,474,077 kilogrammes of jerked beef were exported. The exports of coffee and India rubber go largely to the United States. The value of the exports to North American ports in 1892 was \$118,633,604, while only \$14,291,873 worth was imported from North America. Most of the imports come from Great Britain, Germany, and France. The imports of cotton cloth from Great Britain amounted in 1892 to about \$17,000,000, the iron imports to \$3,000,000, machinery imports to \$3,700,000, woolen imports to \$2,000,000, and imports of coal to \$2,250,000.

Navigation.—There were entered in 1893, at Rio de Janeiro, 1,397 vessels, of 2,062,294 tons, and cleared 1,218, of 1,924,449 tons; at Bahia, in 1892, were entered and cleared 965 vessels, of 1,297,712 tons; at Rio Grande do Sul were entered 471 vessels, of 200,798 tons, and cleared 485, of 202,776 tons. From November, 1894, foreign vessels are inhibited from the coasting trade. The registered vessels of over 100 tons burden in 1894 were 164 steamers, of 110,068 tons, and 126 sailing vessels, of 35,908 tons.

Communications.—There were 6,651 miles of railroads in operation, 3,815 miles were building, and 12,411 miles more were projected in 1893. Of the existing lines the Government owned 1,586 miles and subsidized 1,815 miles, and the bonds paying 6 and 7 per cent. of many of the others were guaranteed.

There were 9,179 miles of telegraphs in 1892, with 14,326 miles of wire, all belonging to the Government. The number of dispatches sent in 1892 was 1,143,360.

The post office in 1890 forwarded 18,246,739 private letters, 19,280,135 journals and circulars, and 1,281,700 registered letters and packets; re-

ceipts were 3,243,421 milreis, and expenses 9,323,108 milreis.

The Army and Navy.—Personal service for three years in the army and three years in the reserve is obligatory, except for various exempt classes. The standing army consists of 40 battalions of infantry, 16 regiments of cavalry, 5 regiments of field artillery, 9 battalions of foot artillery, and 2 battalions of pioneers, besides special corps. The peace effective in 1894 was 1,600 officers and 30,000 men. The gendarmerie numbers 20,000.

The naval force consists of 2 battle ships, the "Riachuelo" and "24 de Maio," 3 large cruisers, 9 coast-defense ironclads, 23 small cruisers and gunboats, and 7 first-class and 5 second-class torpedo boats. Two powerful new battle ships are building in France.

The Revolt in Rio Grande.—In the beginning of 1895 the rebels in Rio Grande do Sul took the field under the command of Admiral Saldanha da Gama. The Brazilian troops in pursuing one of the bands crossed the frontier and came into collision with Uruguayan troops, who opposed their advance, killing 1 officer and 3 soldiers. On March 1 the rebels defeated a column of 500 troops near the frontier. The Government charged Uruguay with openly aiding the insurgents, and the Senate debated a resolution to declare war against Uruguay as the only means of ending the revolt. Later the Government forces were successful, and most of the rebels retired into Uruguay. In June, Admiral da Gama, at the head of 400 sailors, was engaged by a brigade of 1,200 Government troops near Santa Aña. He repelled five charges of cavalry, but at last, when 300 were killed or wounded on both sides and most of his men had abandoned the field, he ordered the handful who stood by him to retreat, and then cut his own throat. On July 2 Gen. Galvao, commanding the Government troops, arranged a week's armistice with Col. Tavares, chief of the rebel forces. The men on both sides were tired of resultless bloodshed, and could not be led into battle. The rebels were willing to come to terms if Gov. Castilho would retire, but the Cabinet could not agree upon sacrificing him. Negotiations were reopened. The proffer of Uruguay and the Argentine Republic to mediate was indignantly rejected. Gen. Saraiva collected a new force of several thousand rebels on the border of Uruguay, ready to resume the conflict. At last terms of peace were agreed to in August, to which Gov. Castilho, who had before stood out for unconditional surrender, gave his assent. A free pardon was granted to all who laid down their arms, with a guarantee of all civil rights to every person implicated in the revolution, including the right to appeal to the courts for the redress of injuries committed by the troops. Dr. Castilho was to remain as Provisional Governor until the meeting of the State Congress, which should alter the Constitution so as to make it conformable with the constitutions of the other States. The amnesty bill was passed in September after a sharp debate in both houses, with modifications debarring rebel officers from the army and navy for two years, and extending the amnesty to other political offenders and exiles.

Politics.—In the early part of the year the movement in favor of the restoration of Peixoto to power was active in the army and navy, and had many supporters in São Paulo, Santa Catarina, Paraná, and Rio Grande. The partisans of the ex-President organized demonstrations in the capital. In March, President Moraes closed the military school and expelled the students because they attempted to foment a feeling in favor of Marshal Peixoto and against the existing Government. Disturbances occurred at the elections in Pernambuco in March. The commander of the artillery regiment at San Pablo endeavored to induce his men to declare in favor of Peixoto. Those engaged in the plot were arrested. The ex-President in June announced his intention of standing as a candidate for Senator in the Federal District. His sudden death on June 29 deprived the advocates of a military system of a party head.

The vessels of the navy were reported by the Secretary of the Navy to be unserviceable, and extensive repairs were needed to place the force on the same footing as before the revolution. A new 5-per-cent. internal loan was issued at the beginning of March. It was applied to the redemption of currency, of which there were outstanding 367,338,000 milreis of treasury notes and 340,714,370 milreis of bank notes. The congressional session opened on May 4. The diplomatic rupture with Portugal had been terminated through the intermediation of Great Britain. The President, in his message, spoke of the falling off in the number of immigrants, and said that it would be necessary to take steps for encouraging immigration. Taxation reform was called for. He recommended the reorganization of the National Guard and the strengthening of the coast defenses. The budget was presented in the middle of June. Receipts were estimated at 300,884,000 milreis, and expenditures at 296,028,000 milreis. The Minister of Finance proposed to levy one third of the customs duties in gold, and suggested an income tax and a duty on alcohol. A bill was passed placing a heavy tax on foreign insurance companies doing business in Brazil.

Indemnity Claims.—The Italian, French, German, and British governments brought claims against the Brazilian Government for damages on account of losses sustained by their citizens during the late revolution. They proposed that these claims should be submitted for arbitration. On Jan. 16, 1895, the Minister for Foreign Affairs informed the ministers of those countries that they would have to be submitted to the Supreme Court. The ministers objected to this, and the claims were made the subject of negotiation. The French minister made a settlement which his Government refused to ratify, and he was recalled. The Italian Government had presented immediately a demand for satisfaction because Italians had been tortured during the revolution. It took umbrage at the long delay and at the amount finally offered. The Italian minister finally announced that he would leave on July 7, and demanded his passports. This hastened a settlement. The Italian demands were somewhat abated, and a treaty was signed by which Brazil agreed to pay \$150,000 in gold. The Italian Government gave notice

that emigration to Brazil would be stopped unless Italians were better protected. There was a riot on Aug. 7, in which several Italian railroad laborers were killed. The foreign indemnity claims were not all settled. They amounted in the aggregate to an enormous sum.

The Missiones Dispute.—Brazil and the Argentine Republic agreed, in a treaty concluded on Sept. 7, 1889, to appoint joint commissioners to settle the boundary between the two countries, and, in case they failed to reach an amicable solution of the question within ninety days after the completion of the survey, to submit the matter to the arbitration of the President of the United States. The subject of this old controversy was the region lying between Iguassu on the north, the Uruguay river on the south, San Antonio and the Pepiri-Guazu on the west, and the Jangada, or San Antonio Guazu, and the Chapeco, or Pequiri Guazu, on the east. It is the Missiones territory, which was already in the possession of Brazil, forming a judicial division in the State of Paraná. The area is 11,523 square miles, and the population about 7,000.

The joint commission came to no agreement, and the question was accordingly referred to the President of the United States. Baron Branco represented the Brazilian Government, while the Argentine Republic was represented by its minister at Washington. President Cleveland made his award on Feb. 6, 1895, in favor of Brazil, establishing the boundary line on the rivers Pepiri-Guazu and San Antonio.

British Occupation of Trinidad.—A small rocky island 700 miles off the coast of Brazil, in 20° 20' of south latitude and 29° 22' of west longitude, was recognized when Brazil was a Portuguese possession as belonging to Portugal. Some English settlers once remained for a short time, and later a more permanent Portuguese colony settled there; but this disappeared, and the island had no inhabitants until Baron James A. Harden-Hickey, an adventurous Franco-American, who had discovered the island in 1888, planted a colony of 40 Americans in Trinidad in the spring of 1894. He found guano in merchantable quantities, and intended to construct wharves and buildings for its exportation. Assuming that it was derelict territory, he also conceived the idea of setting himself up as a sovereign prince. In January, 1894, he assumed the style of James I., adopted a flag for his principality, established an order of knighthood, and had paper money and postage stamps printed. None of the powers recognized his pretensions. In the spring of 1895 the British cruiser "Barracouta" was sent to Trinidad to take formal possession. Some months later a passing vessel saw the British flag floating over the island. When this was reported in Brazil the people were greatly agitated. It was supposed that Great Britain intended to utilize the island as a coaling station. Although Brazil had never occupied Trinidad, her historical and documentary title was always considered indubitable. Mass meetings were held in Rio Janeiro and the other cities to manifest the popular indignation. The Brazilian Government presented a remonstrance at once. The British minister explained that Great Britain had occupied the island at the request of an ocean telegraph com-

pany that intended to lay a cable to La Plata, and desired to use it as a landing station for their cable. He said that Great Britain was willing to submit the question to arbitration. After more correspondence the British Government receded from its position and recognized the sovereign rights of Brazil, on condition that permission to lay a cable shall be granted. The Government in September submitted to the Senate a proposition to colonize Trinidad.

Boundary Dispute with France.—The territory on the confines of the State of Para and French Guiana lying between the Oyapok and the Araguay rivers and extending inland to the fifty-sixth meridian is claimed by both Brazil and France. The area is about 30,000 square miles, and the present population perhaps 18,000, consisting of Indians and some creoles and negroes. The claim has been put forward in behalf of the French to the whole country north of the Amazon as far west as the river Branco, embracing 100,000 square miles. In the seventeenth century France occupied this region and disputed with Portugal the possession of the northern mouth of the Amazon. In the treaty of Utrecht, concluded April 11, 1713, the boundary was defined to be a river called Japok, or Vincent-Picon. The French and the Portuguese could not agree afterward what river was meant by these designations. The French held that it was either the Araguay or the Mapa; the Portuguese claimed that it was the Oyapok. The river Carsevenne was accepted as a compromise boundary in 1797. The treaty of Amiens gave the country down to the Araguay to France; but war annulled that arrangement, and when peace was restored, in 1815, Brazil was required to make restoration only of Guiana north of the Oyapok, France reserving her claim to the disputed country even as far as the Amazon. The French established a military post at Mapa in 1836, but withdrew it in 1841 at the earnest solicitation of Brazil, both governments agreeing to treat the district as neutral territory until the boundary lines were settled. The disputed region is called sometimes Amapa, or Mapa, sometimes Cunane, from the principal inhabited places. A conference was held at Paris in 1856, at which the Brazilian Government offered to accept the Carsevenne, or Carsewena, as the boundary, to which the French Government would not agree. The French Government made representations in 1874 to the Brazilian Government, protesting that Brazilians were entering the country and endeavoring to gain over the inhabitants for Brazil. Both governments then engaged to discountenance and suppress the activity of political emissaries. A French journalist named Gros, with a view to prepare the way for annexation by winning over the people, many of whom were descendants of fugitive Brazilian slaves, and attracting a colony of French immigrants, set up what he called an independent republic at Cunane, of which he proclaimed himself President. The Brazilian representative at Paris entered a protest against this proceeding, and an official notice was published by the French Government stating that France and Brazil both claimed sovereign rights over the district. This was sufficient to deter capitalists and emigrants from going into the

enterprise, and compelled the ambitious adventurer to retire. When the Brazilian minister in Paris broached the subject of a boundary settlement anew in 1878, M. Waddington assumed that Brazil had conceded the territory north of the Carsevenne, and that the tract in dispute was the area between that stream and the Amazon. This left the Brazilian Government no acceptable basis for negotiations. In 1892 the French Government suggested a mixed boundary commission. The Brazilian Congress made an appropriation, and in February, 1895, the French legation was informed that the Brazilian Government was ready to negotiate.

The question had meanwhile become much more urgent. A French citizen from Cayenne, named Tamba, had discovered rich gold deposits, which had brought an influx of adventurers, mostly from French Guiana. There was no security for life or property in the absence of all civil authority, and when Veiga Cabral, the chief of the principal Indian community, assumed to enforce laws and to levy taxes, and pretended to keep order with an armed force, his rule was accepted by the natives and for a time tolerated by the strangers. When the miners became numerous enough to form a community of their own in Cunane and on the Carsevenne river they refused to submit to the regulations and exactions of Cabral. They organized an administrative service, with a force of public surety of their own under the command of a settler named Trajane, who received an official commission from the authorities in Cayenne and hoisted the French flag. A border conflict was thus precipitated. The love of fighting as well as the lust for gold drew wild and daring men into the country from both sides. A force of 20 men belonging to Cabral's constabulary and led by Luis Bentes, a Brazilian officer, marched to Cunane, hauled down the French tricolor over Trajane's house, replacing it with the Brazilian flag, and carried him off a captive in irons to Mapa. This incident, when it became known in Cayenne, caused there great excitement. The Governor decided on taking immediate steps to restore French prestige and prevent the territorial claims from being extinguished by a *fait accompli*. He sent the gunboat "Bengali" to Mapa, with a company of marine infantry under Capt. Lunier. The marines were rowed 15 miles up the river to the village of Cabral, where Cabral had his headquarters. Capt. Lunier landed with a part of his force and marched up to Cabral's house. Cabral shot the captain, after which a fusillade was opened upon the Frenchmen from all the houses in the village. According to the French account, Capt. Lunier carried a flag of truce, intending merely to demand the release of Trajane. The Brazilians say that the French soldiery were ordered to arrest Cabral, who fired in defense of his liberty. The whole French force was soon engaged, and gained the victory after two hours' combat. The Brazilians returned, however, with fresh forces after the French had burned the village, and the latter retreated and took to their boats, carrying off 2 Brazilians and a Portuguese subject as prisoners, and 5 killed and 20 wounded. The Brazilians were reported to have lost 60 men.

The French minister at Rio Janeiro entered

an immediate protest. The Brazilian Government promised to make a strict inquiry, but declared that French troops had no right to invade the neutral territory. The Governor of Para was ordered to investigate the matter, and when his report was received the Brazilian minister at Paris demanded indemnity for the losses of life and property. Gov. Sobre, of Para, asked for troops to guard the frontier, on the ground that the French were making fresh aggressions, though the Brazilians in the disputed territory seemed to have the advantage. Frenchmen who entered the territory had to submit to the commands of Cabral, and some were not permitted to land. Four Frenchmen were arrested, but were permitted to appeal to their Government for their release. In Cayenne, volunteers were enrolled in the Government offices to serve in the event of war. A great number of young men went out to Cunene, ostensibly as prospectors, but heavily armed and eager for a conflict. The Governor granted permission to minors to carry weapons, and issued a proclamation declaring that the Brazilian authorities were entirely at fault, and that France would seize the opportunity they gave to make good her claim to the whole country down to the Amazon. The French Government recalled Gov. Charvein, and ordered a judicial investigation of his conduct and that of the chief naval officer commanding the "Bengali." On Aug. 15 the French representative at Rio Janeiro and the Brazilian Minister of Foreign Affairs signed a protocol agreeing to submit the question of sovereignty over the neutral territory to the arbitration of the King of Sweden. Each Government has till April 1, 1896, to submit its case.

BRITISH COLUMBIA, the extreme western province of Canada.

Government.—Late in 1894 the ministry of Hon. Theodore Davie was sustained by a substantial majority in the general elections, but shortly afterward Mr. Davie resigned to accept the chief justiceship of the province, which had been vacated by the death of Sir Mathew Baillie Begbie. The Hon. James H. Turner, Minister of Finance, became Premier, and D. M. Eberts was appointed Attorney-General.

The new Legislature met on Nov. 12, and was opened by Lieut.-Gov. Dewdney, in a speech from the throne, of which the following passages are the most important:

The year which is now drawing to a close has been one of great financial depression throughout the world, and, consequently, in common with other countries, the revenue has not come up to expectation. The floods were productive of much damage to property, and expenditures became necessary in excess of the sums voted by the Legislature, for the purpose of restoring means of communication and extending temporary relief to those in need. The moneys required were raised, with the advice of my ministers, by special warrant, and you are called together at an earlier date than is usual, in order that you may ratify these and other expenditures demanded in the public service, and also to consider an act for raising a loan to be devoted to works of public utility. In extending relief to sufferers from the floods, I caused seed to be supplied to farmers who had lost their crop, with the highly gratifying result that the produce has not been seriously diminished, and in some instances is equal to and greater than in former years.

Coal mining, which during the early part of the

year was for lack of profitable foreign demand restricted, exhibits signs of renewed activity. The exports of lumber have been larger than in preceding years. Quartz mining in Kootenay, and the inauguration on a large scale, in Cariboo and elsewhere, of placer mining by improved hydraulic methods, have been most encouraging. The season's operations in salmon canning have been large; the sealing industry has experienced a successful year, the fleet returning with an unprecedented catch; and it is gratifying to observe that attention has been directed to deep-sea fishing, and that a regular trade has now been established with eastern markets. The Nakusp and Sheshaan Railway is completed, and large bodies of ore are being shipped over it. The bonds authorized by the act of last session have been negotiated in London, bearing interest at 4 per cent. per annum, and have been sold at a premium of 4 per cent. The Department of Immigration has effected the location of a Norwegian colony of well-to-do settlers in Bella Coola valley.

During the three months' session that followed, a large amount of business was transacted, the following being the most important measures that became law:

To confer limited civil jurisdiction upon stipendiary magistrates and police magistrates.

To authorize a revision of the statutes.

To amend and consolidate the acts relating to the legal professions.

The Workman's Lien for Wages act.

For the establishment of a Government bureau of mines.

To amend and consolidate the act to regulate the practice of dentistry.

To amend the county courts act.

To incorporate tramway, telephone, and telegraph companies.

To provide £420,000 for the public purposes of the province.

To secure to wives and children the benefit of life insurance.

To supply water to the city of Nanaimo.

To amend the provincial voters act.

To incorporate cheese and butter associations.

The vote of \$600,000 for new Parliament buildings at Victoria was vigorously denounced by many of the members from the mainland. They contended that, instead of beautifying the capital—which is on the island of Vancouver—the money should be spent upon extending railways to mining centers and opening up new territory and resources. But arrangements were made to borrow the money as required, and handsome buildings are now in process of erection. Adjournment took place on Feb. 21, 1895.

Finances.—The estimated revenue for the year ending June 30, 1895, was as follows: Annual grant, interest and subsidies from the Dominion Government, \$345,089.45; land sales and revenue, \$160,000; timber royalty and licenses, \$40,000; timber leases, \$50,000; the miner's certificates, \$30,000; general mining receipts, \$25,000; licenses, \$35,000; real-property tax, \$99,000; personal-property tax, \$105,000; wild-land tax, \$50,000; income tax, \$8,500; revenue tax, \$47,500; fines and forfeitures, \$8,000; law stamps, \$12,000; registry and probate dues, \$55,000; interest, \$20,000; Chinese restriction act, \$30,000; succession duties, \$6,000; withdrawal of certain loans from sinking fund, \$130,000; miscellaneous, \$31,050; funds from 1894, \$90,000; total, \$1,268,139.45.

The estimated expenditures for the year were as follow: Public debt, \$157,400.80; civil gov-

erument (salaries), \$145,880; administration of justice (salaries), \$116,654; legislation (salaries), \$38,800; public institutions (maintenance), \$27,650; hospitals and charities, \$43,750; administration of justice (sundries), \$52,700; education, \$188,745; transport, \$7,550; revenue services, \$10,000; public works, \$343,950; miscellaneous, \$74,568.50; total, \$1,237,648.30.

During the summer of 1895 Mr. Turner, the new Premier, visited England, and issued a provincial loan of £420,000. It runs for fifty years, and was taken up at 95 and 3 per cent. interest. On his return he was able to announce that a powerful syndicate had been formed in London to develop the mines of British Columbia.

Railways.—Railway construction during the year was limited chiefly to the completion of the Nakusp and Slocan Railway, which had been built to furnish an outlet to the silver ores of the Kootenay mining district. Many thousand tons of ore have since been shipped to United States smelters. Other projected lines into this mineral region were also discussed or carried forward a stage. The British Pacific Railway, an important and wide-reaching enterprise, was deferred, and other proposed and chartered lines were delayed for want of capital.

Mining.—The mining development of the year was satisfactory. The output of coal during 1894 was 1,012,953 tons, making it the second best year on record. Of this amount, 827,642 tons were exported, chiefly to California. Some went to Alaska, Siberia, and the Hawaiian Islands. On one of the islands of the Queen Charlotte group 3 beds of bituminous coal have been discovered, and also 2 large seams of anthracite. Investigation showed the existence of a seam of coal 30 miles long and of a superior quality near the Crow's Nest pass in the Rockies, and several smelting works have been established upon the mainland.

Exports of silver ore from the Kootenay district began in December, 1893, and in the following six months were valued at \$415,000. Gold mining also appears to have had a boom, principally in the Cariboo district, where several joint-stock companies have been formed.

Rich deposits of iron ore have been discovered where the ore averages 65 per cent. of iron. They are said to be extensive and accessible. During the twelve months ending June 30, 1895, 49 mining and smelting companies were incorporated in the province, with a nominal capital aggregating \$24,344,000.

Fisheries.—The fisheries of the province were successful. The total salmon pack during 1894 was 494,371 cases, valued at \$2,362,714. The shipments of halibut to New York and Boston were in their usual quantities and in good condition. During the year 53 vessels, averaging 66 tons, and giving employment to 827 whites and 518 Indians, sailed from Vancouver to seek the fur seal. The catch was large, amounting to 94,474 skins, but the ruling prices were poor. Great dissatisfaction was felt in the province at the refusal of the American Congress to confirm the agreement with Great Britain regarding the compensation of \$425,000 for the Bering Sea seizures.

Lumber.—During the year the export trade in lumber largely increased, but the prices were

not very remunerative. The quality and extent of the resources of the province in this respect are very great, and it is therefore not surprising that in 1894 13,730,764 feet were taken from leased lands, while over 54,000,000 feet were taken from Crown lands, timber limits, and private property. The total exports were 46,490,000 feet.

New Industries.—These were confined to the establishment of some smelting works—notably that at Pilot Bay, West Kootenay, and the development of certain paint, chemical, and cold-storage works begun in the previous year.

Agriculture.—In the fiscal year ending June 30, 1894, 60,642 bushels of wheat were imported, in addition to the large quantities from Manitoba. But the good harvest of the succeeding season is expected to diminish this import. Fruit was largely grown and in good demand, the area under hops was much increased, and dairy farming received active encouragement from the Government.

Education.—During the year 185 schools were in operation, the total expenditure on education being \$169,050, an average of \$13.40 per pupil enrolled, or \$21.71 if based on the actual general attendance.

Commerce.—Despite the commercial depression trade in the province was exceptionally good. For nearly a quarter of a century the exports have increased with almost unbroken regularity, and during this year they reached high-water mark. The imports also were augmented. The continued success of the Canadian Pacific steamship service to China, Japan, and Australia helped largely in this development, and the vessels of the Northern Pacific line were also kept fully engaged.

BULGARIA, a principality in eastern Europe created in 1878 out of a former province of Turkey by the decision of the great powers at the Congress of Berlin and augmented by the annexation of the province of Eastern Roumelia in 1885. The legislative power is vested in the Sobranje, a single Chamber in which, under the constitutional amendment adopted in May, 1893, there is a representative for every 20,000 of population. Every adult male citizen possesses the electoral franchise.

The reigning prince is Ferdinand, born Feb. 26, 1861, youngest son of the late Prince August of Saxe-Coburg-Gotha and of Princess Clementine of Bourbon-Orleans. He was elected by the vote of the Sobranje in 1887, and has since reigned *de facto*, though his election, as well as the union of the two Bulgarias, has not been regularized by the formal sanction of the treaty powers and of the Ottoman Porte.

The Cabinet of ministers in the beginning of 1895 was made up as follows: President of the Council and Minister of the Interior, Dr. C. Stoiloff; Minister of Foreign Affairs and of Public Worship, G. D. Nachevich; Minister of Finance, Ivan E. Gueshoff; Minister of Justice, P. Pecheff; Minister of Public Instruction, Dr. V. Radoslavoff; Minister of War, Col. R. Petroff; Minister of Roads and Communications, C. Velichkoff.

Area and Population.—The area of Bulgaria proper is estimated to be 24,360 square miles, and that of South Bulgaria, as Eastern

Roumelia is now called, 13,500 square miles. The total population of both on Jan. 1, 1893, was determined by a census to be 3,300,816. There were 2,504,636 Bulgars, 569,728 Turks, 60,018 Greeks, 51,754 gypsies, 27,531 Jews, 3,260 Germans, and 1,379 Russians. In religion, 2,605,905 were Greek Orthodox, 22,617 Roman Catholic, and 643,242 Mohammedan. The population of Sofia, the political capital, is 47,000; of Philippopolis, capital of South Bulgaria, 36,000. The number of marriages in 1893 was 31,640; of births, 141,320; of deaths, 92,100; excess of births, 49,220.

Finances.—The revenue for 1894 was estimated in the budget at 101,077,550 lei, or francs, and expenditure at 102,207,982 lei. Of the revenue, 41,942,250 lei were direct contributions, 22,363,000 lei customs and excise taxes, 7,549,000 lei receipts from transportation, 5,757,800 lei revenues from public property, 3,906,500 lei tolls, 720,500 lei fines, and 18,839,500 lei came from other sources. Of the disbursements, 17,336,651 lei were for the public debt, 17,295,353 lei for financial administration, 22,412,787 lei for defense, 12,902,383 lei for transportation and public works, 9,351,268 lei for the interior, 8,823,743 lei for education, 4,763,347 lei for justice, 4,215,358 lei for commerce and agriculture, 3,403,292 lei for foreign relations, and 1,766,800 lei for the central administration. The debt amounts to 158,000,000 lei.

The Army.—The national army, in which service is obligatory, consists of 24 regiments of infantry, 4 of cavalry, and 6 regiments of field artillery, besides 6 mountain batteries. The forces are organized in 3 divisions of 2 brigades each, mustering in time of peace 38,320 officers and men, and having a war strength of 175,000 men, with 288 field guns and 36 mountain guns. Vidin, Rustchuk, and Silistria are fortresses on the Danube, Varna on the Black Sea, and Shumla near the Servian land frontier. A flotilla of small gunboats is kept for the defense of the Danube.

Commerce.—The Bulgarians are a farming population. The chief product is wheat. Other articles of export are animals, wool, tallow, timber, flax, butter, cheese, and hides. The value of the grain exports in 1893 was 74,609,525 lei; of the live animals exported, 6,525,000 lei. The total value of imports in 1893 was 90,867,900 lei, the principal articles being textile fabrics for 27,984,300 lei, metals for 8,476,925 lei, and machinery for 7,879,850 lei. The extent of the trade in 1893 is shown in the following table, giving values in lei:

COUNTRIES.	Imports.	Exports.
Great Britain	20,121,576	17,045,094
Austria	22,315,569	2,505,431
Turkey	10,014,471	24,510,000
Germany	12,000,000	15,018,465
France	4,029,818	14,202,212
Italy	2,807,720	2,104,191
Russia	3,890,911	22,674
Romania	2,150,150	692,977
Belgium	1,518,878	572,150
Servia	1,194,969	194,969
Switzerland	1,015,073	150
Greece	98,605	514,291
United States	117,494	80,575
Total	90,567,900	91,463,620

Communications.—There are 520 miles of railroads and 2,953 miles of telegraph lines. The number of telegraphic dispatches in 1892 was 1,056,610. The mails carried 11,204,000 letters, newspapers, etc.

Fiscal Reform.—In attempting partially to equalize and modernize the system of taxation on the renewal of commercial treaties with various states, the Bulgarian Government became involved in diplomatic difficulties. A plan of financial reform was worked out by which the tithes would be reduced 40 per cent., and the extra taxes diminished considerably. The direct taxes—consisting of the tithe, the tax on vineyards, the land tax, and the tax on sheep and goats—all falling almost exclusively on the peasants, have amounted to nearly twice as much each year as the indirect taxes. The peasants have, in fact, paid more than twice as much *per capita* for the support of the Government as the inhabitants of the towns—12.65 francs in 1894 against 6.15 francs. In Roumania, Servia, and Bosnia the tithes and other antiquated taxes have been reformed; and after studying the systems introduced there, the Bulgarian Government decided to make similar, though less complete, changes for the relief of the complaining farming people. The tithes were much higher than they used to be when they were payable in kind, having been commuted into a money tax on the basis of the prices for agricultural produce that formerly prevailed. Some countries whose commercial treaties were about to expire were induced to permit an increase in the import duties from 8½ to 10½ per cent. *ad valorem*. In addition, a light excise duty, 75 centimes a kilo, was imposed by an act passed by the Sobranje upon certain luxuries, such as spirits, olive oil, and confectionery. The tobacco duty was doubled a year before, but had yielded only three-fourths of the anticipated 12,000,000 francs. A provisional commercial convention had been concluded with Austria-Hungary before the act was passed on Dec. 30, 1894. As soon as the bill was signed the Austro-Hungarian Government raised a protest, representing the new tax as an augmentation of the customs duty. The Bulgarian Government in its reply contended that it was a purely domestic impost. Austrian and other foreign merchants resisted the assessment of the excise tax, refusing to allow an inventory of their stock to be taken, as they were enabled to do by the capitulations, and Bulgarian merchants would not submit to an impost that their foreign rivals were enabled to evade. The new excise was calculated to bring in 7,000,000 francs, and the increased import duties 3,000,000 francs. A license law, introducing a progressive tax on the incomes of traders and manufacturers, foreigners as well as Bulgarians, required under the capitulation the assent of the powers, which was not given to a similar law passed in 1885. The new internal-revenue duty and the increased customs duty were threatened with defeat by the action of Turkey, even if the difference with Austria were settled, for the Porte threatened to levy a proportionate excise duty and a differential customs duty of 2 per cent. on Bulgarian products. The Bulgarian Prime Minister went to Vienna, and on May 9 an

agreement with the Austro-Hungarian Government was reached, whereby not only was the excise duty maintained, but in the definitive treaty of commerce, which should be concluded within two years, the duty of 10½ per cent. on imports was to be increased to 14 per cent. The Bulgarian Government, in its negotiations with the powers whose treaties of commerce expired Jan. 13, 1895, originally proposed to make the general tariff 15 per cent., and accepted provisionally an increase to 10½ per cent. This was the arrangement made with Great Britain and the other countries pending the conclusion of new treaties within two years.

The Assassination of Stambuloff.—The government of M. Stoiloff, supported by the Conservative and Unionist parties, crushed out opposition as ruthlessly and effectually as Stambuloff had done. Elections took place in the beginning of February, 1895, to fill vacant seats in the Sobranje. At Tirnova the Government candidate was elected by an overwhelming majority over Stambuloff and a Zankoffist, but not without a conflict between the military and the people. The authorities used force also at Rustchuk and Loftcha; and at Biela Slatina, where Zankoff was elected at the previous election, both parties used firearms, and his supporters were prevented from voting. The only place where an Opposition candidate was allowed to be elected was Rasgrad, which returned Karaveloff. In the municipal elections at Varna, which occurred later, the adherents of Radoslavoff were ousted after a serious riot. Although the Opposition parties were deprived of representation, there was no harmony between the factions of Stambuloff, Radoslavoff, Zankoff, and Karaveloff.

A commission of the Sobranje, appointed to investigate the actions of Stevan Stambuloff and his Cabinet, on Jan. 2, 1895, obtained from the military court an order for the arrest of the fallen dictator, on the charge of complicity in the murder of Belcheff, on account of which Petko Karaveloff was sent to prison for five years in 1891. The latter was now set free. The threatened arrest of Stambuloff caused a great agitation among the people. The foreign diplomatic agents in Sofia intervened to prevent the arrest. The popular unrest was extended to the army by the action of the Government in dismissing, on the ground of incapacity, 25 captains and many other officers who had been promoted by the late Government. The police made domiciliary visits at the house of Stambuloff, and constantly persecuted him and his followers. Several of his police officials were convicted of crime. M. Lukanoff, who was prefect of Sofia during the latter years of his Government, was sentenced to four years' imprisonment on the charge of torturing persons suspected of plotting against Prince Ferdinand. Stambuloff knew in April that a band of his enemies was leagued together to murder him, to revenge Major Panitza and four men who were executed as Belcheff's murderers, and suspected that the ministers and the Prince were cognizant of the plot. The chief of this band was Tufekchieff, who was sentenced in Constantinople for the murder of Dr. Vulkovich, the Bulgarian agent, and whom the Bulgarian Government re-

fused to extradite and allowed to go free, notwithstanding its promise to keep him imprisoned. Under a law passed in the last session of the Sobranje, the former Mayor of Sofia and some employees of the Government of Stambuloff were cited before the tribunals to give an account of their official conduct and of the sources of their income. When himself summoned to testify in a suit brought against one of his police inspectors for illegal arrest by Col. Kissoff, who was interned as the leader of the conspiracy against Prince Ferdinand in 1890, Stambuloff refused to obey, on the ground that an ex-Cabinet minister can not be called to account for his official conduct except by order of the Sobranje. He and his friends, foreseeing his impending fate, begged the Government incessantly to allow him to leave the country, his physician having ordered him to go to Carlsbad for the waters. The Government refused to let him depart, because the commission of inquiry objected. He kept armed retainers to prevent his enemies from breaking into his house.

On July 15, when he was about entering his house, Stambuloff was attacked by four men, two of whom shot him and two stabbed him. Wounded in twenty places, he died on the third day, after telling his wife that Haliu and Tufekchieff had killed him, getting her to promise to accept nothing from the palace. The police, instead of arresting the assassins on the spot, allowed them to escape and cut down those who attempted to pursue them, and then pushed their way into the house of the murdered man and arrested his friends and servants on the pretense that they were accomplices. The widow rejected the wreath sent by Prince Ferdinand and his message of condolence and refused to receive any one connected with the Government or the court. At the funeral a rabble danced and sang ribald songs over the grave. A month later the grave was desecrated and an attempt was made to steal the body. Prince Ferdinand, who was at Carlsbad when his former minister was murdered, was afraid to return immediately.

Deputation to St. Petersburg.—In furthering the intrigue by which Stambuloff was removed from office Prince Ferdinand was actuated by the desire to become reconciled to the Czar and obtain the recognition of the powers. Zankoff, who was pardoned and returned from exile in January, 1895, was ambitious to be the agent of reconciliation, but the Stoiloff ministry was willing to make concessions in order to regain the good will of the Czar. The Sobranje voted to send a deputation to St. Petersburg to deposit a wreath on the tomb of Alexander III. The Panславist agitation in Bulgaria ceased after the degradation of Stambuloff. Prince Lobanoff, Russian Minister of Foreign Affairs, sent out a circular in March to Russian representatives in the Balkan states, enjoining them to abstain from interference in the domestic affairs of those countries. The Bulgarian deputation, headed by Archbishop Clement and Teodoroff, President of the Sobranje, arrived in Petersburg in the beginning of July and was received by Prince Lobanoff, and on July 17 had an audience with the Emperor.

Macedonian Agitation.—A movement was started in Bulgaria for the revival of the Mace-

donian question, which the Government attempted to discredit, but took no pains to check. Macedonian committees were formed in every town and funds were collected with the avowed object of securing the execution of the reforms in Macedonia that had been promised in the treaty of Berlin.

The Government moved officially in the related question of the Bulgarian exarchate in Macedonia. The exarchate was established by the firman of March 11, 1870, which restored the ancient autocephalous Church, and thus recognized the Bulgarians as a distinct nationality within the Ottoman Empire in spite of the opposition of the Greek patriarchate. The privileges accorded by the firman were withdrawn in part in 1876 in consequence of the action of the patriarchate in declaring the Bulgarian Church schismatic; but some of them were revived by the appointment of Bulgarian bishops to Uskub and Gebrida in 1890 and to Nevvokop and Kuprili in 1894. The Exarch Joseph in 1895 petitioned for *berats* for Adrianople, Monastir, and Salonica, to which the Sultan Abdul Aziz, in the firman of 1870, promised to appoint bishops, and for two other districts under the clause of the firman that stipulates that bishoprics shall be erected wherever two thirds of the population demand.

The aspirations of the revolutionary Bulgars in Macedonia, who found as yet little support among their Greek, Servian, Wallachian, and Albanian fellow-subjects, were for the creation of an autonomous province and the promulgation of an organic statute like that of South Bulgaria. The revolutionary excitement in Macedonia was caused by the Arnenian troubles. The political societies that fomented the agitation confined their formal demands to the introduction of autonomous institutions guaranteed by the powers in the treaty of Berlin. There were two rival Macedonian societies in Bulgaria, known respectively as the Fraternal Union and Young Macedonia, the former affiliating with Karaveloff's party, and the latter with the party of Stambuloff. A congress was convoked in Sofia at the beginning of April, at which delegates representing the interests of the Greeks, Wallachs, Serbs, and Albanians in Macedonia were expected to appear. Not only was the co-operation of committees in Athens, Bucharest, and Belgrade withheld, but the Fraternal Union held aloof until one of its leading members, M. Kitanchieff, was elected president of the congress. The Turkish Government urged the Bulgarian Government to apply repressive remedies to the growing agitation. After an affray occurred, in which a Turkish official lost his life, the Turkish garrisons on the frontier were strengthened. Arms were seized and adventurers who attempted to enter Turkey were arrested. The Turkish officials in Macedonia resorted to harsh methods to repress the agitation, and thus made the situation more dangerous. Thousands of Macedonians who were in Bulgaria as laborers and their Bulgarian sympathizers were ready to cross the frontier with arms in their hands. In June Turkish frontier guards crossed the line in three places, and the Bulgarian Government made representations on the subject to the Porte. A troop of Bashi Bazouks came into collision with Bulgarian police,

who had seized sheep that strayed over the border, and wounded some of the gendarmes, for which the Bulgarian Government demanded from the Porte a pecuniary indemnity. On June 19 an insurrection broke out in the district of Palanka, which was followed by disorders in the district of Katchianik, both situated in the vilayet of Uskub. Armed bands began to pour into Turkey from Roumelia, unrestrained by the Bulgarian frontier guards that had been increased on account of the violations of the frontier by Ottoman troops. The insurgents engaged the Sultan's troops in the mountains and compelled one company of them to retire. A Mohammedan village near the frontier was burned. The Bulgarian Government, which in its declarations regarding the Macedonian movement had taken a correct attitude, was afraid to co-operate with the Turkish authorities and even sought a ground for quarreling with its suzerain. In reply to a note of the Porte urging that a stricter guard be kept on the frontier, the Bulgarian agent at Constantinople presented a note repeating the demand for satisfaction for the recent violations of Bulgarian territory and reiterating the request of the exarch for the creation of five new bishoprics. The Porte returned a sharp refusal to this demand, denying the right of the Bulgarian Government to interest itself in Macedonian affairs or to intervene in its relations with the Bulgarian Church in Macedonia. The same note contained a significant hint that unless the Bulgarians, both in the principality and in Macedonia, maintained a peaceable attitude the consequences for them would be disastrous. On receiving this uncompromising reply, the Bulgarian Government informed the Sultan that it saw no necessity for the presence of its diplomatic representative at the Porte. In consequence M. Dimitroff left Constantinople on June 23, leaving the agency in charge of the secretary.

The Macedonian revolt spread rapidly between Palanka and Vranja, extending to the country between the rivers Prahia and Kriva. The rebels tore up the railroad. In Preshevo, the Arnauts formed bands of Bashi Bazouks and attacked villages. The insurgent bands that fought the Turkish troops were armed with Martini-Henry rifles. The Turkish troops at Palanka were re-enforced, until it was impossible for fresh bands to cross the frontier. One band of insurgents was surrounded at the village of Gherman, and many were killed and the remainder made prisoners. The political parties in Bulgaria no longer hesitated to show open sympathy with the rebellion. Some Macedonians who held commissions in the Bulgarian army deserted to take part in the revolutionary uprising. Exaggerated stories of Turkish violence, of atrocities, such as the exhibition of heads, were spread abroad, in the vain hope of eliciting sympathy abroad and gaining the support of some of the great powers, for unless they intervened the attempted insurrection must come to naught. The Turkish Government drafted regiments from Constantinople and Asia Minor, until 50,000 or 60,000 regular troops were massed in the disturbed district, whose duty was to watch the Bulgarian army and to serve as a reserve only for dealing with the insurgents, as Bashi Bazouks were organized in

every district to suppress a revolt wherever it should arise, and preparations were made for calling in the Albanian clansmen if their aid were needed. The powers made representations at Sofia in regard to the questionable attitude of the Government, which replied in a circular note that the sympathy evinced by the great powers for Armenia had led the Macedonian emigrants in Bulgaria to hope to obtain for their country reforms similar to those proposed in Armenia; the Bulgarian Government had permitted the agitation to go on, being persuaded that it was employing purely moral means, and that severe repressive measures would lead to a more dangerous secret agitation. The note expressed the hope that the great powers, which had already expressed their views regarding the evils of the existing administration of Macedonia, would find means in the interests of peace to calm the public mind, as had been done in the case of Armenia. A promise was made to the Porte to

take vigorous measures against the agitation and to prevent bands from crossing the border. Accordingly, the prefects were warned to watch closely enterprises directed against any neighboring state.

A band of 1,000 Bulgarians made a raid across the frontier near the end of July, and after defeating the Turkish patrol at Djuma, entered the town of Menlik, and burned the Mohammedan quarter. On Aug. 9, another band of 1,000 men raided the Mohammedan district of Kirdjali and burned the town of Janakli, after killing 25 of the inhabitants. For this the Porte demanded explanations of the Sofia Government, which replied that no effective surveillance of the frontier is possible without keeping Bulgarian troops there, to which the Porte has always objected. The Mussulman village of Kustendil, in the Rhodope district of Bulgaria, was burned after a fierce fight with the villagers in which many fell on both sides.

C

CALIFORNIA, a Pacific coast State, admitted to the Union Sept. 9, 1850; area, 158,360 square miles. The population, according to each decennial census since admission, was 92,597 in 1850; 379,994 in 1860; 560,247 in 1870; 864,694 in 1880; and 1,208,130 in 1890. Capital, Sacramento.

Government.—The following were the State officers during the year: Governor, James H. Budd, Democrat; Lieutenant Governor, Spencer G. Millard; Secretary of State, Lewis H. Brown; Comptroller, Edward P. Colgan; Treasurer, Levi Radcliffe; Attorney-General, W. F. Fitzgerald; Surveyor-General, M. J. Wright; Superintendent of Public Instruction, S. T. Black; Chief Justice of the Supreme Court, W. H. Beatty.

Finances.—The report of the Comptroller showed balances on hand in the various State funds on Dec. 1, 1894, as follows:

General fund, \$175,891.19; school, \$187,300.69; interest and sinking, \$25,086.16; State school land, \$22,812.35; State school-land deposit, \$3,160; San Francisco harbor improvement, \$73,098.09; State University, \$3,471.09; Mining Bureau, \$486.59; State Library, \$4,149.90; Supreme Court Library, \$2,218.93; war bond, \$2,993.30; Yosemite valley, \$49.49; adult blind, \$5,802.13; revolving fund, \$43,529.60; estates of deceased persons, \$730.72; railway tax, \$448,520.25; railway tax contingent, \$1,868.86; Fish Commission, \$280.44; San Quentin State Prison, \$123,458.31; Folsom State Prison, \$73.06; Insurance commissioners, special, \$3,340.55; Bank commissioners, \$5,766.95; State schoolbook, \$32,354.50; dissolved savings bank, \$3,069.70; Fish Commissioners' fund, purchase of boats, \$1,100; special Mendocino Insane Asylum, \$15,728.73; San Diego harbor improvement, \$4.95; San Francisco depot sinking, \$22,444.50; Whittier Reform School, \$15,529.31; Building and Loan Association inspection, \$715.43; San Francisco depot, \$71.25; total amount in State Treasury, \$1,254,292.02.

Other items in the Comptroller's report show that the receipts for the fiscal years 1893-'94 and 1894-'95 were \$17,583,493, and the expenditures \$17,078,647; excess of receipts over expenditures, \$504,846. For the forty-fourth fiscal year the tax levy for school purposes was \$1,966,-

174. The actual amount collected from property tax was \$2,115,911. For the forty-fifth fiscal year there was levied for school purposes \$2,057,279. There was collected \$2,201,144, of which \$72,758 was for back railroad taxes for the years 1880 to 1885, inclusive.

The receipts from other sources amounted to \$569,316. These amounts, together with the balance from the forty-fourth fiscal year, aggregated \$3,361,637.

The funded debt of the State held in trust for the university and school funds amounts to \$2,-282,500.

Appropriations and Taxes.—The tax-levy bill passed by the last Legislature is a mandatory statute, and reads as follows:

The State Board of Equalization must, for State purposes, for the forty-seventh and forty-eighth fiscal years, fix such an *ad valorem* rate of taxation upon each \$100 in value of taxable property in this State, as after allowing 5 per cent. for delinquencies in costs of collection of taxes, as provided in section 3696 of the Political Code, will raise for the forty-seventh fiscal year: First, for the general fund, \$4,913,106; second, for the school fund, \$2,195,459; third, for the interest and sinking fund, \$141,435. And for the forty-eighth fiscal year: First, for the general fund, \$2,681,371; second, for the school fund, \$2,195,459; third, for the interest and sinking fund, \$141,435. The total amount of appropriations passed and provided for in this bill was \$12,268,265; of this, \$7,-250,000 was for the forty-seventh fiscal year, \$4,913,-106 being for the general fund. The amounts payable from this fund during the year are: Half of the general appropriations, \$2,311,869; miscellaneous and special appropriations, \$600,000; for orphans, \$325,000; and all deficiencies, \$294,661; making a total of \$3,531,530. But the State Board of Equalization has no power to raise any other amount than the sum called for in the tax-levy bill, therefore the tax levied for the year as ordered was \$4,913,106, and thus a surplus of \$1,381,576 above what was necessary has been provided for by the levy of about 10 cents on each \$100 of valuation for the present year.

Legislative Session.—The thirty-first biennial session of the Legislature began on Jan. 7 and continued until March 16. In 1894, Gov. Budd was the only Democratic State officer

elected, his majority being 1,200, and the Republican majority for Lieutenant Governor being 21,678. The Republicans determined to contest Budd's election on the ground of fraud, and made efforts to do so, finally appealing to the Attorney-General for his opinion as to how the contest should be made. By him they were advised that the article of the Political Code which provides the manner of a gubernatorial contest is unconstitutional in that it confers judicial power on the Legislature, and that the State Constitution prohibits contest for Governor and for every office under the State government. Gov. Budd therefore was inaugurated on Jan. 11. On Jan. 23 George C. Perkins, who by appointment had acted as successor to Leland Stanford since that gentleman's death, was elected to fill the unexpired term as United States Senator.

Among the constitutional amendments proposed by the Legislature which are to be submitted to public vote are these: To permit the use of voting machines at all elections; to exempt mortgages from taxation; to extend the right of suffrage to women; to limit the liability of stockholders of corporations or joint-stock associations, and make directors or trustees jointly and severally liable to stockholders and creditors for all money embezzled or misappropriated by officers of the corporation.

A primary election law was enacted which provides that all political parties must now hold their primaries on the same day, at the same place, and with the same election board, which must be nonpartisan. Each party must have a ticket of distinctive color, and if a voter offers a ticket of a party other than that to which he belongs his vote may be challenged and refused. This law applies only to counties of the first and second class, but it provides that the Governor shall issue a proclamation to make the day on which the primary election is held a legal holiday throughout the State.

Resolutions were adopted favoring, respectively, Hawaiian annexation and the election of United States Senators by popular vote; asking Congress to do all in its power to assist in constructing a cable from San Francisco to the Hawaiian Islands; to enact laws for the protection of farm products; to amend the laws granting arid lands to the State, so as to permit California to reclaim them and drain them as a permanent school endowment; to appropriate \$2,600,000 for improvement of Sacramento and San Joaquin rivers; to make an appropriation for the construction of a deep-sea harbor in Los Angeles County; and memorializing Congress for the enactment of legislation for the free coinage of silver at the ratio of 16 to 1.

Among bills that became laws are these:

To aid the dairy industry by prohibiting frauds in butter and cheese, and establishing a State dairy bureau.

Compelling barbers and bath-house proprietors to close for half a day on Sundays and legal holidays.

Amending section 781 of the Penal Code and adding a new section relating to the suppression of riots and parading of independent companies.

Empowering boards of commissioners having the management and control of paid fire departments to grant the members thereof yearly vacations.

Creating an exempt firemen's relief fund in the several counties and cities and counties of the State.

Adding a new section to the Penal Code to be known as 264 and relating to the severance and removal of fixtures and improvements upon mortgaged property.

Authorizing the issuance of bonds by cities or towns to protect them against overflow.

Appropriating \$30,000 for the survey, location, and construction of a free wagon road from the town of Mariposa to the Yosemite valley.

Creating the office of fish and game warden.

A new bankrupt act.

To create a public school-teachers' annuity fund.

To provide for the purchase by the State of real estate sold for delinquent taxes and providing for the subsequent redemption of such property at a reasonable rate of interest.

To provide that a grant or conveyance of real property, made by a married woman, may be made, executed, and acknowledged in the same manner and have the same effect as if she were unmarried.

To prevent the sale of imitation or adulterated honeys.

To create sanitary districts, and providing that no license to keep a saloon or to sell liquor at retail shall be operative without the consent of the sanitary board.

To prohibit adulteration of drugs, food, or drink, and to prohibit the watering of liquors.

Appropriating \$10,000 to enable the State to make a suitable exhibit at the Atlanta Exposition.

Insurance.—The report of the Insurance Commissioner gives the following statistics for 1894: Amount of fire insurance written, \$385,322,000; premiums, \$6,780,453.93; losses paid, \$2,667,160.24; amount of marine insurance written, \$128,610,786; premiums, \$1,354,459.16; losses paid, \$808,792.67.

Banks.—There are 31 national banks in the State, 4 fewer than in 1894. The semiannual statement of the Bank Commissioners, made in August, shows the combined assets of the national banks to be \$31,157,277.77, a gain in twelve months of \$1,467,327.17. The total amount of money on hand in the banks of the State on June 15 was divided as follows: National banks, \$4,658,487.72; private banks, \$130,087.42; commercial banks, \$18,571,248.42; savings banks, \$4,600,551.11; total, \$27,930,374.67. The combined assets by classes were: National banks, \$31,157,277.77; private banks, \$2,516,943.69; commercial banks, \$130,514,624.94; savings banks, \$144,960,729.01; total, \$300,179,571.41. There was due to depositors from national banks, \$15,781,747.58; from private banks, \$919,386.18; from commercial banks, \$56,583,174.24; from savings banks, \$126,830,512.86; total, \$200,114,820.86. These figures show an increase in deposits of \$4,431,634.33 during the half year.

Railroads.—The Valley Railroad, to extend through the San Joaquin valley from San Francisco eastward and southward to Bakersfield, Kern County, 350 miles, was incorporated in January. By legislative action permission was given to the company to lease 50 acres for a terminus from the San Francisco Harbor Commissioners.

The annual report of the Southern Pacific Company, its proprietary companies, and leased lines for the year ending Dec. 31, 1894, was issued in May. It shows as total receipts above operating expenses, \$16,050,949, a decrease from the receipts of 1893 of \$2,107,840, attributable to a falling off in business consequent upon the strike, hard times, and other causes. Receipts

from other sources swell the aggregate of receipts to \$16,963,335.

The annual report of the Central Pacific Railroad Company shows receipts, from earnings and other sources, of \$13,118,244, against \$14,319,907 for 1893. The total expenditures were \$12,973,651, against \$13,535,190 for 1893. The net income from operations for the year was \$144,593, against \$784,717 for 1893.

The first issue of this company's second mortgage bonds fell due in January. They amounted to \$2,362,000, with 6 per cent. interest for thirty years, or a total of \$6,613,600. At the beginning of the year there was in the United States Treasury to the credit of the land and interest account, for transportation service rendered to the Government by the company, the sum of \$7,308,945.63. In the sinking fund there was \$5,436,000, and the company was entitled to additional credits of \$658,283.26 and \$264,107.76, making the total assets of the company in the possession of the Government \$13,567,336.35.

The matter of the railroad reassessment for 1887 is still unsettled.

The Southern and Central Pacific Railroads have made recent selections of more than 500,000 acres of land. By law they are permitted to select only agricultural land, but it is contended that much of the land selected is mineral land, and efforts are being made to prevent the issuance of patents to the railroads therefor.

Dairy Bureau.—This bureau, created by the last Legislature, was organized in May and has made stringent regulations for the protection of the milk, butter, and cheese industry. Heavy penalties will be exacted for adulteration or for selling oleomargarine and kindred products without labels accurately describing them.

Wines.—Internal revenue returns filed in September show that there are 104 stills in the State, each of which employs about 15 men. The Government allows vineyardists to conduct distilleries for the manufacture of grape brandy to be used in flavoring or "fortifying" sweet wines, and on brandy so used no tax is levied. For the proper investigation of the sweet-wine distilleries, and to prevent abuse of the "right of fortification," Government keeps more than 60 gaugers in the field, whose services are free to the vineyardists. The brandy used is 24 proof, and sherry, port, angelica, and muscat contain about 14 per cent. of brandy for fortification. Following is the output of sweet wines, in gallons, for the season of 1894-'95, as reported before and after official fortification, the increase noted being due to the addition of brandy: Plain wine, port, 1,345,598; sherry, 483,877; angelica, 240,718; muscat, 151,501; total, 2,221,694. Fortified, port, 1,595,135; sherry, 566,716; angelica, 289,319; muscat, 183,163; total, 2,634,333. Fresno and Los Angeles are the great sweet-wine centers.

By action of the Legislature the State Board of Viticulture was this year dissolved, and the duties performed by it were imposed upon the State University, with an annual appropriation of \$5,000. The report of the board, made at the end of last year, showed that of the \$30,000 appropriated for the support of the commission for 1894 and 1895, \$14,171.11 had been expended.

Oranges.—The Southern California Fruit Exchange at Los Angeles reports that during the

season of 1894-'95, closing Sept. 1, 2,502,500 boxes, or 7,700 cars, of oranges were shipped through the exchange. This included 3,205 cars of navels, 2,924 cars of seedlings, 881 cars of Mediterranean sweets, 254 cars of Australian navels, 203 cars of St. Michaels, 82 cars of bloods, 47 cars of Valencia, and 4 cars of Jaffas.

Fruit Growers' and Shippers' Association.

—This society, organized in February, is the result of a resolution adopted by the Fruit-growers' Convention, held in Sacramento in November, 1894. Its object is to establish a bureau of information for the purpose of regulating the distribution of Eastern fruit shipments, and also for arranging the number and method of auction sales of such shipments. It was decided to have only one auction room in each city, and also that the sales and rooms should be open and free to all bidders. At its organization the society represented 75 per cent. of the fruit industry of the State.

Insane Asylums.—In February the east wing of the San Bernardino asylum for the insane was finished; the west wing was completed in November, 1892, and was opened in August, 1893. With its two wings, the asylum has a frontage of over 800 feet, and includes four wards for men and two for women. In June it contained 311 patients—207 men and 104 women. This is one of several asylums for the insane. The Governor this year refused to sign the bill making appropriation for its maintenance, and in his message to the Legislature said that one of the main sources of State extravagance is the care of the insane, and that a large percentage of the so-called patients confined in the State asylums are not legally entitled to a home in those institutions.

Folsom Prison.—On July 11 there was turned over to the State property valued at \$2,000,000, the payment for which had been made in convict labor at 50 cents a day for each convict. This property comprised the 483 acres near Folsom devoted to the prison site, all the buildings on it, a dam in the American river within the prison site, a 30-foot canal 6 feet deep to Folsom, with a 72-foot fall at Folsom, and a power house and first-class electric plant. The work was done by State convicts for the Folsom Water Power Company, successor to the Natoma Water and Mining Company, which owns the bed of the American river and land on both sides for 2 miles. Power can now be furnished to large factories and plants of various kinds. On July 12 electric power was transmitted from Folsom to Sacramento. In 1858 the Legislature authorized the selection of a site for a branch prison; in 1874 \$175,000 was appropriated for its construction, and Folsom prison was completed in 1882.

Society of Pioneers.—The annual report of this society shows the receipts for the year in the general fund as \$20,595.62; disbursements, \$19,534.33. The relief fund was increased, \$1,715.93 during the year, making a total in this fund of \$27,216.86; of this, \$9,910.40 was disbursed, leaving a balance of \$17,306.46, of which \$7,306.46 is available for relief work during the coming year. The total assets of the society are placed at \$464,166.50; its liabilities amount to \$384,674.23. The number of members is 1,108, of whom 733 are original pioneers.

River and Harbor Improvements.—The annual report to July, 1895, on river and harbor improvements in California says of the work at San Diego harbor that the trestle was advanced under the new contract during the fiscal year 882 feet. The jetty wall was further completed to high water for a length of 234 feet, and the foundation course was laid for 248 feet additional. No effects of the jetty extension have been noticed upon the bar depth; some local scour took place beyond the end of the jetty, and at points where the depth was 5 or 6 feet there is now 18 feet 8 inches of water.

On San Joaquin river \$20,985 has been expended during the year, making the total of \$242,246 for the improvement. A low-water channel of 9 feet has been obtained to Stockton, and snagging operations above that point have benefited the river.

On Sacramento and Feather rivers the amount expended during the year was \$33,426, making the total \$611,741. The wing dam at Sacramento has removed the shoal from the bridge.

In Humboldt Bay the work of improvement is under a continuance contract system, and the undeveloped harbor is being improved by means of jetties. During the year \$300,244 was expended, making a total of \$876,727, and two channels 25 feet deep have been obtained.

Midwinter Fair.—The report of the financial operations of the Midwinter Fair of 1894 was made in January, 1895. The total receipts were \$1,260,112.19, and the disbursements \$1,193,260.70, leaving a balance of \$66,851.49, which the table of assets shows is made up of \$61,952.45 cash, the remainder being material and property remaining unsold. There are still outstanding liabilities amounting to \$39,046.99.

On March 23 the art building that had been erected for the fair was transferred to the Commissioners of Golden Gate Park, and was formally dedicated and opened as a museum. At the time of opening it contained between 5,000 and 6,000 exhibits.

CANADA, DOMINION OF. Government.—After Sir John Thompson's death, at the close of 1894, the Governor General called on Mackenzie Bowell to form a Government, which he did as follows on Dec. 21, and soon afterward was knighted:

Premier and President of the Privy Council, Sir M. Bowell; Postmaster-General, Sir A. P. Caron; Minister of Marine and Fisheries, Hon. John Cantagan; Minister of Finance, Hon. G. E. Foster; Minister of Justice, Sir C. H. Tupper; Minister of Railways and Canals, Hon. J. G. Haggart; Minister of Public Works, Hon. J. A. Ouimet; Minister of Militia and Defense, Hon. J. C. Patterson; Minister of the Interior, Hon. T. M. Daly; Minister of Agriculture, Hon. A. R. Angus; Minister of Trade and Commerce, Hon. W. B. Ives; Secretary of State, Hon. A. R. Dickey; Solicitor-General, Hon. J. J. Curran; Comptroller of Customs, Hon. N. C. Wallace; Comptroller of Inland Revenue, Hon. J. F. Wood. In accordance with the workings of the Canadian system the new Government, like the preceding ones of Macdonald, Abbott, and Thompson, was Conservative in politics, that party still having a majority in Parliament.

The fifth session of the seventh Parliament

opened at Ottawa on March 18, 1895. The most important matters mentioned in the Governor General's "speech from the throne" were as follow:

Satisfactory assurances have been received from Her Majesty's Government respecting the interpretation of certain clauses in the treaty of commerce with France. Ratifications will be exchanged as soon as necessary legislation has been passed. The recent action of the Imperial Parliament, enabling the various Australasian governments to enter into preferential trade relations with the other self-governing colonies of the empire, affords gratifying proofs that the suggestions of the Colonial Conference are being favorably entertained by Her Majesty's Government.

The depression in trade which has prevailed throughout the world for the past few years has made itself felt in Canada, but, fortunately, to a less degree than in most other countries. Although this has not resulted in any considerable decrease in the volume of our foreign trade, yet, owing to low prices and recent reductions in and removal of taxation, it has been followed by a serious decrease in revenue derived from customs and excise.

The Government of Newfoundland having intimated its desire to renew negotiations looking to the admission of that colony into the Dominion of Canada, a subcommittee of my advisers have recently met in conference a delegation from the Island Government and discussed with them the terms of union.

When the address in reply had been moved and seconded and discussed in the usual formal manner—congratulatory on the one side, depreciatory on the other—it was carried by the normal Conservative majority. Mr. Foster acted as leader of the House, and Mr. Bowell as leader of the Senate.

Finance.—Mr. Foster, Minister of Finance, delivered his budget speech on May 3, 1895. The following is a summary:

The revenue, as estimated for 1895-'96, was \$34,500,000; the actual revenue was \$26,574,000. The decrease was spread over the whole list of duties on imported articles. The total imports, including coin and bullion, were less than in the preceding year by \$8,611,047. The dutiable imports were less by \$7,094,389. The causes of the shrinkage might be classed under three heads—reduced consumption, lowered value, and reduced taxation. The expenditures during the year amounted to \$37,045,000, an excess over 1892-'93 of \$770,972. Of this increase, \$406,597 was due to interest on debt and \$270,000 to provincial subsidies. The total expenditure exceeded the revenue by \$1,210,000. He calculated that by the removal of the duty on sugar, in 1891, \$4,000,000 had been saved to the people. Had that rate of taxation been maintained, there would have been a surplus of \$3,000,000 instead of a deficit.

Coming to the year 1894-'95, he pointed out that the revenue, actual and estimated, was \$23,300,000, a decrease of \$2,274,000 from the preceding year, while the expenditure would be \$28,000,000, leaving a deficit of \$4,700,000. The increase of \$400,000 in the expenditure was explained by an increase of \$175,000 in the interest on the debt; the reduction of the voters' lists, etc., \$155,500; an expenditure of \$148,000 in aiding the Imperial Government to fortify Esquimaux; increased provincial subsidies of \$178,000. The sugar duties were again referred to, and the fact was stated that at the old rate \$4,000,000 would have accrued, or more than enough to cover this deficit. The total increase in the national debt from 1870 to 1895 had been \$13,552,287, against a reduction in duties during that period upon glass, anthracite coal, and sugar amounting to \$22,000,502.

There had been increase in exports during the year to Great Britain of \$4,500,000, and to France and Ger-

many. The decrease had been to the United States, Portugal, and Holland. In imports there had been increase from Germany, Spain, Italy, Newfoundland, the West Indies, South America, China, Japan, and Switzerland. With regard to the United States the net decrease in imports and exports was \$13,000,000. In 1898, when the wave of depression began to float over the world, the exports from Canada amounted to \$98,000,000, while last year they reached \$117,500,000. In the same period the imports had risen from \$109,500,000 to \$113,000,000. The duties on the former total aggregated \$23,726,784, and in the latter year, on the larger amount, \$19,119,000.

His proposals for equalization of revenue and expenditure included the reimposition of a third of the old duty on sugar— $\frac{1}{4}$ a cent a pound on the raw product—and a proportionate protective duty on the various grades of refined sugar. This would probably give \$1,200,000. An additional tax was to be imposed upon distilled spirits, giving perhaps \$600,000 more. As his estimate of revenue for 1899-'00 was \$35,000,000 and of expenditure \$36,700,000, this would leave a clean slate. To meet the existing deficit of \$4,500,000 he had made a vigorous reduction in departmental expenses, and had decided to ask for no new railway subsidies.

Political.—The central subject of discussion in Parliament and the country during the session was the Manitoba school question. The decision of the Judicial Committee of the Imperial Privy Council left an opening for Dominion interference with the act of 1890 by which the Manitoba Legislature had abolished separate schools. On the plea that the minority in that province had been unjustly treated, the French-Canadian members of Parliament, and their leaders in the Dominion Government, insisted upon intervention, while a strong counter-agitation was aroused in Ontario and elsewhere. A crisis was precipitated in the Cabinet, and three ministers resigned. Finally harmony was restored by the issue of the remedial order to Manitoba, by which the Federal authorities practically ordered the province to adjust its educational system so as to restore the alleged rights of the Roman Catholic minority. The unusual promise of a sixth session was made so as to legislate in this direction, should Manitoba refuse to obey.

On June 5 a motion was introduced by Mr. Davin in favor of woman suffrage. Mr. Laurier, leader of the Liberal Opposition, moved an amendment referring the question to the provinces, but this was defeated by 54 majority. On the original motion 47 votes were given in favor and 105 against. All the Liberal leaders voted against it, while 21 of their supporters voted for it, as did 26 Conservatives. This was the first occasion on which the opinion of the Canadian Parliament had been taken on the question.

The sum of \$25,000 was voted to the widow and family of the late Premier, the leading members of both parties supporting the proposal. The national fund for the same purpose already amounted to \$37,000. An unpleasant but necessary discussion arose over the extravagant expenses of the state funeral that had been given to the late Premier, which were found to have reached \$25,000, and a considerable amount was ultimately pruned from the items as submitted.

The treaty with France finally came into operation on Oct. 14, 1895. Under this ar-

range ment 21 articles will be admitted into France at the minimum duty, and French wines are admitted into Canada at low rates.

Four by-elections in April resulted in a gain of 3 seats for the Liberals. A conference was held at Ottawa during the session between delegates from the Canadian and Newfoundland governments, with a view to the island's admission into confederation. But the financial demands of Newfoundland were greater than the Dominion authorities cared to accede to, and the negotiations fell through. Parliament was prorogued on July 22.

Legislation.—The chief legislation of the session was in modifying the civil-service regulations, improving the administration of criminal law, advancing commerce, and extending telegraph and railway communications. The principal bills passed were as follow:

- To amend the insurance act.
- To amend the act to encourage the development of the sea fisheries and the building of fishing vessels.
- To incorporate the Ontario Accident Insurance Company.
- To amend the act to readjust the representation in the House of Commons.
- To amend the Indian act.
- To amend the Dominion lands act.
- To amend the civil-service act.
- Respecting commercial treaties affecting Canada.
- To amend the copyright act.
- To incorporate the James Bay Railway Company.
- To incorporate the Lindsay, Haliburton and Mat-tawa Railway Company.
- To incorporate the Dominion Atlantic Railway Company.
- To revise and amend the act respecting the Lake Manitoba Railway and Canal Company.
- To incorporate the Trans-Canadian Railway Company.
- To encourage silver-lead smelting.
- To amend the customs tariff, 1894.
- Respecting the bounty on beet-root sugar.

Railways.—The number of miles of completed railway at the end of the fiscal year 1894 was 15,768, an increase of 448 miles. Of these, all but 141 miles were in operation, and all but 400 miles were laid with steel rails. The paid-up capital amounted to \$887,975,020, an increase of \$15,818,545, the gross earnings to \$49,552,528, and the working expenses to \$35,218,433. The net earnings for the year were therefore \$14,334,095, a net decrease of \$1,092,269. Although the gross earnings and expenses were less than in 1893, the passenger traffic showed an improvement, the number carried being 14,462,498, or an increase of 844,471. The freight traffic fell off by 1,282,483 tons, the total quantity carried being 20,721,116 tons. Twelve passengers were accidentally killed during the year. The Intercolonial, the chief Government railway, again showed a surplus. Its earnings for the year amounted to \$2,987,510, and its working expenses were \$2,981,671. The total Government expenditure on this road has been \$54,680,904.

The Canadian Pacific Railway at the close of the fiscal year had under traffic in Canada 6,094 miles, against 5,782 miles in 1893, and its gross earnings were \$19,357,098, against \$20,795,304 in the previous year. Its working expenses were \$12,447,808 leaving as net earnings \$6,909,290. These figures do not apply to its

American branch lines, such as those of Duluth or Minneapolis. Toward the close of 1893 important changes were made in the management of the Grand Trunk Railway, Sir Charles Rivers Wilson becoming president in succession to Sir Henry Tyler. The working Canadian mileage of this road is 3,158 miles.

Canals.—The St. Lawrence and other canals have cost the country, before and since confederation, in 1867, a total for construction, repairs, and maintenance of \$74,921,250. Of the original expenditure for construction, the Imperial Government contributed \$4,173,921. The traffic through this system, mainly connecting the Great Lakes with the sea was, in 1893, as follows:

POWER AND CAPACITY.	Canadian vessels.	U. S. vessels.
Passengers (including mail and freight)	9,392	1,439
Tonnage (including mail and freight)	11,560	8,158
Tonnage (including mail and freight)	8,454,004	1,286,280

The total number of passengers carried was 124,189; the freight was 3,546,989 tons, and the tolls received were \$329,014. During the year there was a decrease of 420 in the number of Canadian vessels, and an increase of 657 in the number of American vessels. The total receipts for 1894 were \$385,539, and the expenditure on maintenance, repairs, etc., was \$663,539. The Welland Canal contributed more than half of this revenue. The completion of the Sault St. Marie Canal, connecting Lakes Huron and Superior, at an expenditure of \$2,791,873, gave the final link to the Canadian system.

Trade and Commerce.—The imports and exports for a four-year period were as follow:

YEARS.	Imports.	Exports.
1891.....	\$119,967,698	\$98,417,396
1892.....	127,496,968	113,963,973
1893.....	129,074,368	118,561,824
1894.....	128,474,940	117,564,949

During the last-mentioned year the imports from Great Britain were \$38,747,249, and from the United States \$62,907,431. The exports to Great Britain were \$68,538,856, and to the United States \$35,809,940. After varied fluctuations and numerous tariff changes, the total trade with these two countries stands almost exactly where it did in 1873, although the total trade of the Dominion has increased by \$13,000,000. The chief fluctuations in the Canadian export trade during the fiscal year 1894 included an increase to Great Britain of \$4,458,363, a decrease to the United States of \$8,113,070, an increase to Germany of \$1,295,591, to France of \$280,939, to the British West Indies of \$197,362, to China of \$204,457, to Newfoundland of \$223,959, and to Denmark of \$111,377. The total net decrease was \$1,039,403.

Debt and Taxation.—The receipts from customs in 1894 were \$19,198,000, a decrease of \$5,770,840 since 1890, but an increase from the total of \$12,782,824 in 1878, when Mr. Mackenzie and the Liberals left office. The duties collected on imports from Great Britain were \$8,245,845; from the United States, \$6,960,950. The receipts from excise were \$8,381,089, compared with \$4,858,671 in 1878. The receipts from

other sources were \$8,795,600. The gross debt of the Dominion on June 30, 1894, was \$308,348,024, and the assets \$62,164,994. The net debt was \$246,183,029, an increase of \$18,868,254 since 1887, compared with an increase of \$114,989,810 between 1874 and 1887, when the Canadian Pacific Railway was being built and other public works constructed.

Banking and Business.—The deposits in the post office and other Government savings banks during the year were \$55,955,590, an increase of \$1,282,106. Those in the loan companies during 1893 were \$18,531,573, a decrease of \$860,592. The total loans on real estate in these latter institutions were \$110,916,560, and the overdue mortgages amounted to \$2,746,648. The deposits in the chartered banks on July 31, 1894, were \$176,583,465, compared with an average in 1888-'92 of \$134,771,032. The notes in circulation during 1894 amounted to \$31,166,003; the capital paid up, \$62,063,371; the total deposits (including Federal and provincial governments), \$181,743,890; the discounts, \$204,124,939; the total liabilities, \$221,066,724; the total assets, \$207,520,020. The failures during the year in business were 1,854, with liabilities estimated at \$17,607,258.

Minerals.—The production of copper during 1894 was valued at \$805,760; gold, \$354,431; iron ore, \$226,611; lead, \$188,262; nickel, \$2,061,120; silver, \$409,239; asbestos, \$420,825; coal, \$8,447,329; coke, \$147,861; gypsum, \$202,011; natural gas, \$313,754; petroleum, \$835,322; pyrites, \$121,581; salt, \$170,687; bricks, \$1,800,000; building stone, \$1,200,000; cement, \$140,659; granite, \$109,936. With sundry estimated quantities, the total value was \$20,960,000, compared with \$13,500,000 in 1888.

Fisheries and Marine.—There were 70,719 men engaged in the Canadian fisheries during 1894; \$158,794 was paid by the Government in bounties; the total production or catch was \$20,719,573; the export amounted to \$11,102,692; and employment was given to 35,280 boats. The number of vessels built and registered was 336, with a tonnage of 21,243; 43 were sold to other countries, at a value of \$243,429. The seagoing vessels entered and cleared at Canadian ports were as follow:

NATIONALITY.	Number.	Tonn.	Weight of freight.
British.....	8,881	6,164,645	1,736,199
Canadian.....	18,796	2,834,091	748,916
Foreign.....	11,179	6,786,800	1,304,698

The tonnage of the vessels employed in the inland waters between Canada and the United States (Canadian ports) was 9,072,543 tons, and that of the vessels employed in the coasting trade 26,560,968 tons.

Postal Service.—The number of post offices in 1894 was 8,664; the registered letters, 3,237,200; the free letters, 4,925,500; the total letters posted, 107,145,000; the post cards, 23,695,000; the newspapers, periodicals, books, etc., 93,617,861. One hundred and eighty-seven new offices were opened, and the revenue was \$3,734,418 with an expenditure of \$4,442,339.

Insurance.—During 1894 there were 25 fire-insurance companies doing business—6 Cana-

dian, 21 British, and 8 American. The premiums received were \$6,711,369; the losses paid, \$4,589,363, a decrease in the latter amount of \$463,000. The business, according to nationality, is shown in the following table of totals—1869-'94:

COMPANIES.	Premiums received.	Losses paid.
Canadian.....	\$79,086,748	\$21,080,844
British.....	72,032,185	49,552,909
United States.....	10,615,145	7,169,196

During 1894 12 Canadian life-insurance companies transacted a business of \$28,670,364; 8 British companies, \$3,214,216; 10 American companies, \$17,640,677. The amount in force is respectively \$177,511,846, \$33,911,885, \$96,737,705—a total of \$308,161,436. The assets of the Canadian companies were \$32,444,873; their liabilities, \$27,908,247; their income, \$7,295,609; their expenditure, \$4,225,107.

Social Statistics.—According to the lists prepared in accordance with the Electoral Franchise act, there were in 1895 1,353,735 voters in Canada for Dominion purposes, compared with 1,132,201 in 1891, and 993,914 in 1887. There were 18 asylums for the insane, all supported by the Government, and maintaining at the end of 1893 4,913 males and 4,597 females. The convictions for drunkenness in 1890 were 14,045; in 1891, 12,997; in 1892, 11,415; in 1893, 11,651; in 1894, 11,558—a steady reduction. The number of divorces granted by Parliament in 1894 were 6, and in the 3 provinces which retained that privilege on entering the confederation 3. Altogether 211 divorces have been given in the Dominion since 1868, of which 54 were from Parliament and 157 by the provincial courts referred to. The newspapers at the end of 1893 numbered 919—66 in French, 12 in German, and 1 in Gaelic, 1 in Scandinavian, and 1 in Icelandic. The number of convicts in the penitentiaries was 439, of whom only 11 were women.

Liquor Traffic.—A royal commission was appointed on March 14, 1892, with Sir Joseph Hickson as chairman, to investigate and report upon this traffic and the various measures suggested for its control or abolition. It held 130 public sittings, and heard 1,139 witnesses, whose testimony filled 4,528 pages. A report was presented on March 29, 1895, after the commission had visited all the Provinces and many of the neighboring States. The report, with one dissentient, declared:

1. That the buying and selling of intoxicants can hardly be said of itself to produce injurious effects. Such evils as do arise flow from misuse of the article bought and sold.

2. That legislation aiming at restriction or lessening the trade in, or consumption of, liquor, if it is to be at all effective, must have the active and continued support of a very large majority of the community in which it is to be enforced.

3. Nowhere, so far as the commission has been able to investigate, have prohibitory laws had the effect of stopping the use of alcoholic liquors as a beverage. The commissioners do not believe the social condition of the people of the Dominion would be improved by the enactment of a general prohibitory law.

4. It would adversely affect the agricultural

interests of the country, and would cause a very grave disturbance of its industrial, commercial, and financial affairs. The system of license and regulation is, upon the whole, best.

The commission also makes certain recommendations, among which are: A Dominion register of all manufacturers and sellers of liquor and a Dominion fee and certificate; the establishment of a place for restraining and treating drunkards; the abolition of saloon licenses; the detection of adulteration; the imposition of high license with thorough enforcement; making the illegal purchaser equally guilty with the illegal vendor; the training of the female portion of the population in a knowledge of domestic economy and household duties.

Copyright.—A copyright in Canada may be registered by any person domiciled in the country or in any part of the British possessions, or "any citizen of any country that has an international copyright treaty with the United Kingdom." By the interpretation of the Department of Justice, this latter clause is held to exclude the United States. Reprints of British copyright works not copyrighted in Canada are admitted by the terms of the Canadian and imperial laws, and large numbers of such reprints are in consequence imported from the United States. Partly on this account, an act was passed in 1889 by Canada containing a provision that if a British author does not register his work in Canada within one month of publication in the country of origin, any printer in the Dominion may obtain a license to reproduce it on payment of 10 per cent. royalty to the author. The act has not been assented to by the imperial authorities, because of this and other provisions.

The long dispute over the Canadian Copyright act of 1889 has been settled, to all appearance at least. Mr. Hall Caine spent some time in Canada, and after many negotiations with local publishers and the Canadian ministers, in behalf of the English authors who had objected successfully to the imperial sanction of that act, effected a compromise. What that arrangement is can not be better described than in his own words:

There will be an amended act, to be called the Copyright act of 1896. At the conference with the Ministers of Justice and Agriculture, which my colleague, Mr. Daldy, and myself, together with the Canadian Copyright Association and Canadian publishers, were permitted to hold in Ottawa, a draft measure, which forms an agreement between myself as the delegate of English authors and the interested parties in Canada, was submitted and recommended to the ministers; and we have every reason to hope that it will be regarded as the probable general basis for forthcoming legislation. By this agreement, the time within which a copyright holder can publish in Canada and so secure an absolute copyright is extended from thirty to sixty days, with a possible extension of thirty days more at the discretion of the authorities. Also, by this agreement the license to be granted for the production of a book that has not fulfilled the conditions of Canadian copyright law is limited to one license, and this single license is only to be issued with the copyright holder's knowledge or sanction. Further, the copyright holder, who has an independent chance of securing copyright for himself within a period of sixty days, is to be allowed a second chance of securing it after it has been challenged, and before it can be disposed of by license. This is the ground of the draft bill, which the Canadian Copyright Association has joined with me in recommending.

Events.—Monuments were unveiled at Lundy's Lane and Chateaugay to the soldiers or volunteers who fell in those battles of the War of 1812. Statues of Sir John A. Macdonald, the chief founder of the confederation, were unveiled at Toronto, Montreal, and Ottawa. Major-Gen. Gascoigne was appointed to the command of the Canadian militia.

CAPE COLONY AND SOUTH AFRICA. The British colony of the Cape of Good Hope and the neighboring colony of Natal, together with the independent Orange River Free State and South African Republic and the Portuguese colony of Lourenço Marques, occupy the temperate part of South Africa south of the Limpopo and Orange rivers. Between this region and the Zambesi are the British protectorates of Bechuanaland and British South Africa, occupying the elevated central region, generally fertile, salubrious, and rich in minerals. The southern half of Portuguese East Africa takes up the coast region in the east, and in the west the vast undeveloped German protectorates of Namaland and Damansland extend from the Orange river to the southern confines of the Portuguese colony of Angola.

Cape Colony.—The Legislative Council, of 22 members, elected for seven years, is presided over by the Chief Justice. The House of Assembly has 76 members, elected from urban and rural districts for five years. Any male citizen has a vote who occupies house property worth £75 or receives a salary of £50, and is able to register in writing his name, occupation, and address. There were 91,877 voters in 1894.

The Governor in the beginning of 1895 was Sir Henry Brougham Loch, appointed in 1889. His term expired in 1895, and Sir Hercules Robinson, who held the same office from 1880 to 1889, was appointed his successor. The new Governor arrived on May 30. Sir Hercules Robinson, as a representative of the idea of imperialism as a means of colonial expansion, was expected to work more harmoniously with Mr. Rhodes than the retiring Governor. The Governor is also Imperial High Commissioner of South Africa. The ministry in 1895 was composed as follows: Prime Minister, Cecil Rhodes; Colonial Secretary, P. H. Faure; Treasurer, Sir J. Gordon Sprigg; Attorney-General, W. P. Schreiner; Commissioner of Public Works, John Laing; Secretary for Agriculture, John Frost.

Area and Population.—The colony contains 221,311 square miles, and in 1891 had a population of 1,527,234, of whom 376,987 are of European extraction and 1,150,237 are natives or colored. Cape Town, the capital, with its suburbs had 83,718 inhabitants. There were 6,889 marriages in 1893. The number of adult persons who landed in 1893 was 15,617, and the number of departures was 7,922. Public schools are supported by Government grants, but education is not compulsory, and 28 per cent. of the European population can neither read nor write.

Finances.—The revenue for the year ending June 30, 1893, was £6,446,149, of which £1,836,098 were produced by taxation, £2,731,873 came from services, £350,588 from the colonial estate, £52,655 from fines, stores, etc., and £1,474,935 from loans. The total expenditure was £5,734,503, of which £1,213,204 were for the public

debt, £1,474,163 for railroads, £149,287 for defense, £266,748 for police and jails, £132,347 for the civil establishment, and £1,066,627 were expended under loan acts.

The revenue for 1894-'95 was £5,360,000, and the expenditure £5,162,000. Notwithstanding the fall in prices and the shrinkage in the produce of the colony, including a falling off in the export of diamonds of £800,000, the net profit on the Government railroads, after the payment of interest, amounted to £265,000. The rate of net earnings was 5.32 per cent., the highest on record. The Government brought in proposals in 1895 for the construction of additional railroads, which will cost the colony a further £36,000 a year in interest.

The public debt on Jan. 1, 1894, amounted to £26,798,878, nearly all of which was laid out in railroads and other remunerative investments.

Commerce and Production.—On Jan. 1, 1894, there were 41,041,025 acres remaining of the public lands, 100,609,606 acres having been alienated. During 1893 there were 2,602,400 acres alienated in 1,583 lots. In the year 1892-'93 the crop of wheat was 3,890,898 bushels; of tobacco, 4,400,630 pounds; of wine, 6,156,943 gallons. Of brandy, 1,550,360 gallons were made, and 2,095,515 pounds of raisins were obtained. The product of wool was 32,693,091 pounds; of mohair, 6,585,292 pounds; of ostrich feathers, 225,723 pounds. There were 16,794,850 sheep in the colony, and 5,617,411 Angora and other goats. The number of ostriches was 232,243. The merchandise imports in 1893 were £10,760,556 in value, and the exports of colonial produce £12,765,770. The value of the diamonds exported was £3,821,443; wool, £1,855,076; Angora goat hair, £327,619; hides and skins, £497,109; ostrich feathers, £461,532; copper ore, £202,316. The imports of textiles and apparel were £3,752,910; of articles of food and drink, £2,139,237.

Navigation.—During 1893 there were 770 vessels in the foreign trade, of 1,602,243 tons, entered, and 741, of 1,540,002 tons, cleared. Nine tenths of the tonnage was British. The shipping consisted of 19 steamers, of 2,484 tons, and 9 sailing vessels, of 1,118 tons.

Communications.—All the railroads, except 188 miles, belong to the Government. There were in 1894 a total length of 2,254 miles, all constructed within thirty years. The capital cost was £19,832,619, about equal to £42,500 a mile. The receipts were £2,569,542 in 1893, and expenses £1,510,946.

The telegraphs, which have been constructed by the Government, had a length of 5,602 miles on Jan. 1, 1894. The number of messages transmitted in 1893 was 1,338,725.

The mails in 1893 carried 15,976,836 letters, 7,481,280 newspapers, 474,000 postal cards, 1,502,640 books and samples, and 357,448 parcels.

Legislation.—The House of Assembly gave its attention chiefly to protective tariff measures and to plans for new railroads in the session of 1895. A new duty not provided for in the customs convention between the colonies and states could not be imposed, but duties were proposed which should be the subject of negotiations in the conference that was held after the conclusion of the legislative session. For the protection

of the farmers, who were alarmed at the arrivals of frozen meat from Australia, it was decided to classify this article as preserved meat, thus raising the duty from 12 per cent. *ad valorem* to 2d. a pound. The working people held meetings to protest against this change, which went into effect on Aug. 1, and also against the existing duties on grain and flour, which the Government proposed to raise still higher. They declared that the tariff made bread and meat dearer than in any other British colony, and desired a tax placed on brandy instead. The policy of admitting free the raw materials of colonial manufacturers was approved by the Assembly.

Among the bills that passed was one to prevent the importation of pirated books and music. A leprosy commission reported that the disease was on the increase, and recommended enforced segregation.

The principal railway projects are a line from Mossel Bay to the Graaf Reynet road, and one from Somerset east to King Williamstown, both to be built with a Government subsidy of £2,000 a mile, the Government having the right to take the railroads after twelve years, and also a line from Graaf Reynet to the Middelburg railroad, which will be built by the Government.

Pondoland has been definitely annexed to Cape Colony. Sigcau, one of the chiefs, who resisted the registration of huts for the purpose of the hut tax, after first giving his consent to the annexation, gave himself up in June and was detained at Kokstad for trial. White men had obtained concessions for mining and railroads in Pondoland. These were disallowed by the Supreme Court, on the ground that there was no court of law in Pondoland and therefore they had no enforceable right of action.

Annexation of British Bechuanaland.—The Crown Colony of British Bechuanaland is the territory lying in the angle between the frontiers of Cape Colony and the Transvaal and extending as far north as the Molopo river. The area is 71,000 square miles, with a population in 1891 of 69,376, of whom 5,254 were whites. The natives are a sedentary agricultural people, who grow corn and tobacco and raise cattle. Gold, lead, silver, and iron are found. The colony is governed by an Administrator, residing in Vryburg, a town established by Transvaal Boers, who organized a republic here, which was afterward seized and annexed to the British Empire at the time when the rest of Bechuanaland, extending over the Kalihari Desert to 20° of east longitude, the conventional boundary of German Southwest Africa, and northward to 22° of south latitude, was declared a British protectorate, Sept. 30, 1885. This was the result of Sir Charles Warren's expedition, the object being to place the northern trade route under British protection and prevent Germany from extending her possessions to the Transvaal and cutting off Cape Colony from the *Hinterland* that was afterward occupied by the British South Africa Company. The area of the protectorate is about 100,000 square miles. In 1890 the jurisdiction of the Governor of British Bechuanaland was extended over the protectorate and over British South Africa, excluding Matabeleland. The Governor has supreme jurisdiction in all civil and criminal cases, as the finances of the

colony do not admit of an independent administration of the law. The administrative system of the Crown colony is a makeshift adopted pending its ultimate incorporation in Cape Colony. No efforts have been made to develop the natural resources of the country. The cost of the administration to the British taxpayer has been kept down to £8,000 or £10,000 a year, which is all that the colony has had out of the annual grant in aid voted by the imperial Parliament for Bechuanaland, amounting to £100,000. No roads or other public works have been constructed, and education has been quite neglected. The local revenue of the Crown colony, derived chiefly from a native hut tax of 10s., averages £50,000 a year.

When British Bechuanaland was first annexed it was proposed to annex it to the Cape, and negotiations to that end were carried on by Sir Hercules Robinson, then Governor of Cape Colony, who as High Commissioner rejected the conditions proposed by the Cape ministry. When afterward, in 1888, the Cape Government was ready and anxious to take over the territory, the British imperialist element opposed it in the belief that the colonial Government was so much under the domination of the Dutch that it would neglect the duty of preventing filibustering by Transvaal Boers and the free sale of Cape brandy to the native population. The Imperial Government therefore decided to continue the provisional administration till the time arrived when popular sentiment favored the transfer. In 1895 all parties at the Cape were desirous of the annexation, and accordingly a bill was brought in by the Government, which passed the House of Assembly on July 31. In this bill were embodied the conditions imposed by the British Government relative to the transfer of land titles, the sale of liquor, and jurisdiction over the natives, to which the opposition strongly objected. In the Crown colony itself the native chiefs, Montsioa, Molala, and Mankaroane, as well as the majority of the white people of Vryburg, protested against annexation. The opposition in the Cape Parliament suspected that a part of the scheme was to hand over the rest of Bechuanaland to the South Africa Company. Mr. Sauer moved a resolution to the effect that the status of the protectorate be not altered without the consent of the House. It transpired that the Imperial Government had agreed to incorporate in the territory of the South Africa Company all the country north of Mafeking, as was provided in the charter.

Natal.—The new charter granted by the British Government in 1893 vests the legislative authority in a Legislative Council and a Legislative Assembly. The former has 11 members, nominated for ten years by the Governor with the advice of the ministers. The Assembly has 37 members, elected for four years by the male citizens who are qualified by owning real estate worth £50, or paying £10 a year rent, or having an income of £96. The assent of the Governor is required for every legislative act, and this assent after it has been given may be revoked within two years. He has also the right to propose legislation by message, and no money bill unless thus presented by him can be passed in the same session in which it is proposed.

The Governor is Sir William Francis Hely-Hutchinson, appointed in 1893. The ministry constituted Oct. 10, 1893, is composed as follows: Premier, Colonial Secretary, and Minister of Education, Sir John Robinson; Attorney-General, Harry Ecombe; Colonial Treasurer, G. M. Sutton; Minister of Native Affairs, P. R. Moor; Minister of Lands and Works, T. K. Murray.

Finances.—The revenue for the year ending June 30, 1893, was £1,069,678, and the expenditure £1,099,858. The chief sources of revenue were: Railroads, £479,410; customs, £216,040; excise, £20,877; sales of land, £43,951; post office, £38,841; telegraphs, £14,129; stamps and business licenses, £22,349; hut tax, £79,489. The chief items of expenditure were: Railroads, £343,409; public works, £65,607; defense, £66,454. The expenditure from loans was £195,086. The public debt amounted to £7,170,354 on Dec. 31, 1893.

For 1893-'94, the first year under the system of responsible government, the revenue was £1,011,016 and expenditure £1,082,373. In addition to ordinary expenditure £66,444 was spent out of loan funds. There was a balance of assets over current liabilities of £618,154 on June 30, 1894. In 1895 5-per-cent. stock was converted, reducing somewhat the debt and the annual interest charge. A practical balance is kept between current income and current expenditure. The sum of £388,913 will be spent on public works in 1896, when work will begin on a railroad paralleling the coast in the north.

Commerce and Production.—The principal commercial product is sugar, of which 15,803 tons were produced in 1893. The cultivation of tea has been introduced, and 576,420 pounds were gathered in 1893. The natives grow corn and other crops. They have 360,670 and Europeans have 159,074 acres under cultivation. Both raise sheep, goats, and cattle. Of the total area of the colony 8,250,000 acres have been disposed of by grants to Europeans, 750,000 acres have been sold on time payments, 700,000 acres have been leased for grazing, 2,250,000 acres have been reserved for the natives, and 1,000,000 acres remain in the possession of the Government.

The total value of the imports in 1893 was £2,236,738; of exports, £1,242,169. Of the exports, £207,307 consisted of gold dust and bars. The wool exports were £517,102 in value, mostly the produce of the Boer republics. The exports of products of the colony amounted to £829,761, the principal ones besides sugar being Angora hair, hides and skins, bark, and coal, of which 129,255 tons were mined in 1893.

Communications.—The Government has built 392 miles of railroad at a cost of £6,060,122. A line has been constructed from the seaport of Durban to Charlestown, on the Transvaal frontier, and extended thence to Johannesburg and Pretoria. A branch runs to Harismith, in the Orange Free State.

Annexation of Lebombo and Tongaland. Between Swaziland and the Lebombo range forming the boundary of Tongaland is a strip of country about 50 miles long and 15 wide. The southern and larger portion of this is the dominion of the chief Sambaa, adjoining Zululand.

Politically independent, but closely allied with him, is the chieftainess Mdhlaeni, popularly called the Wilew, whose territory covers only 20 square miles. North of her country, extending up to the Portuguese frontier, is the territory ruled by Umbegesa. All these tribes formed part of the Zulu nation and owned allegiance to Chaka and his successors until the Zulu war. In 1880 they offered their allegiance to Great Britain. The Imperial Government declined to assume any responsibility, although it declared then and afterward that this tract lay within the sphere of British influence. By the convention concluded in 1884 with the South African Republic by Sir Hercules Robinson, the Boer Government undertook to adhere to its boundaries, specifically on the west; also to make no treaty with any foreign state or native tribe without the approval of the British Government. Sir Hercules Robinson proposed at that time to place a British commissioner and organize a native police on the eastern border of the Transvaal, but the Imperial Government shrank from the responsibility and expense. Boer graziers trekked into Swaziland and the Lebombo territory, and obtained lands and concessions from the native chiefs. Thus arose the Swazi question, which was finally settled in favor of the South African Republic. In 1887 territorial rights were first acquired by the Transvaal Government in the Lebombo territories, whose chiefs, after being rebuffed by the British authorities, prayed to be taken under the protection of the South African Republic. The Transvaal Government recognized that no political rights were valid without the approval of the British Government, which in 1888 refused to give consent to annexation, and again in 1889, when Sir Hercules Robinson explained that the British Government could not sanction the acquisition of these territories by the Transvaal, for the reason that it would thereby be precluded from exercising an effective control over the future settlement of the Swaziland issue; there was also question as to whether these chiefs were not politically subject to the rulers of Swaziland, Zululand, or perhaps Amatongaland. It was finally conceded that they were independent. The rights acquired by individual Boers were therefore recognized as valid. The legitimate desire of the Transvaal for access to the sea was acknowledged; consequently the convention made by Sir Hercules Robinson in 1890 specifically recognized the right that the Transvaal Government had acquired to construct a railroad through Umbegesa's territory. In the convention made in 1894 this and the other rights in respect to these territories that were conceded in the former instrument were not mentioned. The English have since argued that all these rights were void unless they were reaffirmed in the subsequent convention, also that the former convention expired by time limitation in 1894, and the right to acquire a right of way and build a railroad through Lebombo and Tongaland to the sea lapsed by non-user. The Boers supposed that after the Swazi question was settled in the way for which they had contended, the difficulty in regard to the Lebombo rights was removed. There were no private British interests there, such as had com-

petitioned the Swaziland settlement. A burgher named Van Oordt, a representative of one Ferrara, who once influenced Umbegesa and Mdhlaheni to petition for a Boer protectorate, and who had obtained important concessions, began in March, 1893, to exercise the rights that the native rulers had bestowed upon his associate or principal, going so far as to exercise jurisdiction and levy taxes. An English commissioner named Saunders was thereupon sent into the country, and on the strength of his report and the arrangements that he made with the chiefs the Governor of Natal and Zululand proclaimed in May the annexation to Zululand of the territories of Sambaan, Mdhlaheni, and Umbegesa. A protectorate was proclaimed over Amatongaland, or Tongaland, as far as the coast and up to the Portuguese frontier. The Portuguese boundary line divides the kingdom of Tongaland, so that the chief owes allegiance to Portugal in respect to the northern and to Great Britain in respect to the southern half of his territory. The Governor of Zululand was appointed special commissioner for British Amatongaland, except as regards the Portuguese possessions and the South African Republic, such matters coming within the province of the High Commissioner.

The proclamation annexing the Lebombo states caused great excitement and consternation in Pretoria and among the Dutch of South Africa. The Boers of the Transvaal saw their hopes of having a seaboard frontier cut off; more than that, their claim to an independent railroad outlet was made subservient to the desires of the Natal colonists, and in this they foreboded an intention on the part of the British Government to gain control also of the Delagoa Bay route, and to give effect to its pre-emptive right to acquire the bordering Portuguese possessions, thus inclosing the Dutch republics in a complete ring of British territory and controlling all their communications and commerce with the outside world.

British South Africa.—The region north of the South African Republic and Bechuanaland is the sphere of operations of the British South Africa Company, of which Cecil Rhodes is chairman. The area of this country, to which the name Rhodesia has been given, is about 750,000 square miles. Railroads are being constructed from Beira, on the Portuguese coast, and from the terminus of the Cape line at Vryburg into the gold region of Mashonaland and Matabeleland. Of the former railroad, 75 miles were opened in October, 1893. A good part of the continuation toward Fort Salisbury has since been built. The latter had previously been extended from Kimberley to Vryburg by the company, and when this section of 126 miles had been taken over by the Cape Government, the extension of 100 miles to Mafeking, in Bechuanaland, was proceeded with, and was completed on Oct. 3, 1894. Arrangements were made in 1895 for extending it from Mafeking to Buluwayo at a cost of £1,500,000. The Imperial Government contributes £200,000. In the gold districts, which have an area of 5,250 square miles, towns have been built at Salisbury, Victoria, Hartley Hill and Buluwayo. Buluwayo, the former capital of the Matabele king,

Lobengula, had, in the beginning of 1895, a population of 2,020 Europeans. The members of the pioneer expedition which went to Mashonaland in 1890 and the men who were enlisted in the war against the Matabele in 1893 were rewarded with mining claims or farmsteads. Before September, 1894, the lands surveyed in Mashonaland for farms amounted to 1,722,274 acres, and in Matabeleland 800 claims had been entered for farms of 6,000 acres each. The chartered company had an original capital of £1,000,000, and nearly that amount was paid in by the shareholders in cash. Subsidiary companies, called the United Concessions Company and the Exploring Company, were formed under an agreement that they should receive 50 per cent. of all profits, and in December, 1893, they were amalgamated with the parent company, and £1,000,000 of new stock was issued to their shareholders. There is a debenture debt of £650,000. The company has established a civil administration in the European settlements. It draws its revenue from mining and trading licenses, the sale of business stands in the towns, and the postal and telegraph services. The telegraph, which was extended to Salisbury in 1894, has been connected by the African Transcontinental Telegraph Company with Blantyre, Nyassaland, and ultimately telegraphic communication is to be established by land with Egypt and the European system of telegraphs. The company owns south of the Zambesi 1,551 miles of telegraphs. The company has 100 white officials and 250 white police.

The administrator of the company's territories south of the Zambesi is Dr. Leander S. Jameson. Since the close of the Matabele war the Matabele have accepted the new order, and prove to be a valuable factor in the labor supply both for agricultural and for mining work. There are about 100,000 cattle in the country, and merino sheep have been introduced from the Orange Free State. The farming industry has made considerable progress in both Mashonaland and Matabeleland. Besides gold, beds of coal, salt, and asbestos have been found. Iron is widely distributed. The cost of the Matabele war to the company was £113,488. The company expects to be able to pay its current expenses out of the general revenue in 1895. The ordinary revenue in 1894 was about £50,000 and expenses £70,000. The company expects to have the Bechuanaland protectorate, including Khama's country and a great part of the Kalahari Desert, added to its territories. The company possesses the mineral rights in Khama's country and land concessions for all the country north of Mafeking. A large proportion of these territories consists of high, healthful table-land, resembling Mashonaland, inhabited by peaceful, industrious races. Explorations have been made which show that the country is fertile, and that where surface water is lacking supplies can be found by digging wells. An agreement has been made with the Imperial Government whereby the company is empowered to extend its administration north of the Zambesi up to the southern end of Lake Tanganyika and the confines of the Congo Free State. The new territory comprises the whole of the British sphere north of the Zambesi except the Nyassaland

protectorate. In Nyassaland also the company, which from 1891 until 1895 paid the administrative expenses, possesses rights to minerals and lands. The Barotse king has petitioned for annexation. In the negotiations with the Imperial Government Mr. Rhodes, in behalf of the British South Africa Company, proposed to bind Rhodesia to impose no protective duties on British goods. The Government would not accept a clause that would permit a differentiation of British from foreign goods, and, since the company was unwilling to undertake permanently to extend to foreign goods the advantages it was prepared to offer to goods of British origin, the clause was omitted from the settlement. The company assumed the direct administration of the territories north of the Zambezi in the summer of 1893. The agreement vesting in the company the government of the territories acquired south of the Zambezi was signed in May, 1894. The government is in the hands of an administrator, appointed by the company, who is assisted by a council of 5 members, also appointed by the company. A high court and a land commission have been established. The latter has powers to provide for the settlement of the natives on the land.

There have been 40,000 gold claims registered, representing 2,000 miles of quartz outcrop in an auriferous area of 37,000 square miles. Only a few mines have been developed, because there are no batteries. J. H. Hammond, consulting mining engineer of the company, reports that the veins are of a class universally noted for their permanency. About £750,000 had been subscribed by capitalists for the development of mining properties before the beginning of 1895. The British South Africa Company exacts no mining license fees, but receives half of the vendor's shares in every mining company.

Orange Free State.—The colony founded beyond the Orange river by emigrants from Cape Colony who were unwilling to accept British rule was declared an independent republic in 1854. The legislative power is exercised by the Volksraad, a single Chamber of 38 members elected for four years by the votes of all the burghers, one half being renewed every two years. The President of the republic is elected for five years by direct suffrage. F. W. Reltz succeeded President Brand, deceased, in 1889, and was re-elected on Nov. 22, 1893.

Area and Population.—The estimated area is 48,226 square miles. At the census of 1890 the white population was 77,716, consisting of 40,571 males and 37,145 females. The native population was 129,787, of whom 67,791 were males and 61,996 females. Immigration from Germany and the British Isles is increasing. There were 10,761 persons engaged directly in farming, who had in their employ 41,817 indentured natives.

Finances.—The revenue for the year that ended Feb. 28, 1894, was £293,790 and the expenditures £323,899. The revenue is derived from import duties, stamps, posts and telegraphs, transfer duties, rents, and a native poll tax. The chief items of expenditure are public works, education, salaries, posts and telegraphs, and police. There is a public debt of £55,000, while the public property is valued at £487,000.

Commerce and Production.—There is little land suitable to agriculture, but grain enough is raised on 250,000 acres to feed the population and supply mining communities over the border. The rolling veldt, of which the country consists, is divided into immense grazing farms, of which there are 6,000, covering 24,675,800 acres. The live stock in 1890 embraced 248,878 horses, 276,073 oxen, 619,026 other cattle, 6,619,992 sheep, 858,155 goats, and 1,461 ostriches. The mining of gold and diamonds has heretofore been discouraged, but many fine diamonds are now obtained, and the value of the diamond exports rose in 1894 to £415,262. Wool is the chief article of export, and the trade in hides and skins and in ostrich feathers is large. The total value of the imports in 1891 was £1,630,660.

Communications.—The line of railroad running 121 miles from Nervalapont, on the Orange river, to Bloemfontein, the capital, and thence 200 miles to Viljoensdrift, on the Vaal river, and into the Transvaal, was built by the Cape Government. Natal built the line connecting the Free State at Harrismith with the seacoast. A branch of 60 miles length is being carried to the rich coal field of Vlerfontein.

There are 1,500 miles of telegraphs, connecting Bloemfontein with the systems of Cape Colony, Natal, and the Transvaal.

Legislation.—A compulsory education law has been enacted. The Volksraad debated the question of a federal union with the Transvaal, and appointed a deputation to consult with the authorities of the South African Republic on the subject. A project for a railroad from Bloemfontein to Kimberley and to Harrismith was approved.

South African Republic.—Under the new Constitution, adopted in 1890 and amended in September, 1894, there are 2 legislative chambers, elected by different classes of citizens. First-class burghers are the male whites who were citizens before 1876, or who took an active part in the war of independence in 1881, and their sons sixteen years old or over. Second-class burghers are naturalized aliens and their sons from the age of sixteen. To become naturalized one must have resided two years in the country, and must register an oath of allegiance and pay a fee of £2. Naturalized persons can be made first-class burghers by special act of the First Chamber after twelve years of residence. The sons born in the country of non-naturalized aliens may obtain naturalization at the age of eighteen by registering their intention when they reach the age of sixteen. Only first-class burghers have votes in the election of the President and the Commandant-General. The members of the First Chamber are elected by the first-class burghers. Candidates for the Second Chamber may belong to either class of citizens, and they are elected by the vote of both classes. There are 24 electoral districts, each of which sends a member to each House.

The President of the state is S. J. R. Krüger, who was elected for his third term of five years on May 12, 1893.

Finances.—The revenue for the half year ending June 30, 1894, was £1,096,803, and the expenditure was £632,976. There was at that date an unexpended balance of £609,417 in the

treasury. The revenue obtained from the gold mines for the six months was £501,539. For the entire year of 1894 the revenue was estimated at £1,859,582, and expenditure at £1,595,757. Besides mining dues the sources of revenue are land sales and rents, customs, stamps, transport dues, and a native hut tax. The Government owes £2,500,000, borrowed in Europe, and a war indemnity to England of £192,300, and has guaranteed £8,767,000 of railroad debts.

Commerce and Production.—The original Boer population follows agriculture and stock-raising, while the newer population, which constitutes the second class of burghers and is mainly of Anglo-Saxon stock, is engaged in gold mining. After gold, the principal exports are wool, cattle, hides and skins, cereals, ostrich feathers, and ivory. The dutiable imports in 1893 were £5,371,701 in value. The product of gold increased from 833,632 ounces in 1891 to 1,325,394 ounces in 1892, and in 1893 to 1,610,335 ounces, valued at £5,636,122. Good coal is mined in the eastern hills, and iron, silver, and other valuable minerals exist.

Communications.—The railroad built by the Cape Government across the Orange Free State has been continued to Pretoria, 78 miles from the Vaal river frontier. The line from Durban is being continued from Charlestown to Pretoria. A line from Delagoa Bay to the Transvaal frontier, a distance of 57 miles, was built by a Portuguese company, and has been continued to Pretoria (295 miles) by the Netherlands Company. The line was officially opened on July 9, 1895. There were in September, 1894, within the boundaries of the Republic 422 miles of completed railroads, 391 miles in process of construction, and 473 miles projected. The telegraph lines had a total length of 1,828 miles in the beginning of 1894.

Legislation.—The Englishmen and other Europeans were far from satisfied with the rights conferred upon them by the constitutional amendments of 1894. At the same time that they were demanding fuller political rights they denied the power of the Government, to which they had sworn allegiance, to require military service of them, and appealed as British subjects to the Imperial Government, which made representations to the Transvaal Government, and in February, 1895, succeeded in obtaining from President Krüger a convention abolishing the commandeering of British subjects, subject to the ratification of the Volksraad. The President had already promised, in June, 1894, that British subjects should no more be commandeered for personal military service. The Government proposed to modify the commandeering law, and asked the Volksraad to authorize the enrollment of paid volunteers.

A new grievance was the exclusion under the law of 1891 of foreign coin from circulation. The enforcement of this law affected the supply of labor from Zululand for the Rand mines, as the Zulus wanted to be paid in British coin. The business of some traders was stopped because they had no licenses, and they asked the British Government to interpose and demand that licenses should be issued to them.

Gold Mining.—The product of the Witwatersrand gold field in 1894 was 2,024,162 ounces,

valued at £6,980,000. During the eight years that had elapsed since the mines were opened there had been a total output of 6,544,584 ounces, having a gross value of £22,600,000, extracted from 10,110,000 tons of ore. The dividends paid by the producing mines during this period amount to £4,484,541. In 1894 there were £1,406,266 paid in dividends. There are 50 producing mines, the stock of which had a market value in January, 1895, of £33,000,000. A large part of the earnings of the leading mines in 1894 was expended in adding to their property and the construction of new works. Several of the mines were operated at a loss. The losses since the opening of the first mines in 1887 have been estimated at £2,000,000. Since 1892 the proportion of losses to profits has been smaller. Some of the deep-level mines, for which vertical shafts of from 600 to 1,000 feet have been sunk, first came into operation in 1895. The ore at the lower levels was expected to be neither richer nor poorer than the surface outcrop, as the quality is found substantially the same in the older mines as far down as they have been worked, an average of 400 feet. The average yield per ton is 13·3 dwt., ranging from 8 to 27 dwt. The deep-level workings, as far as they have been developed, indicate that the reefs run even in quality and thickness, averaging 6 feet, and that the dip is the same, 20° to 40°. No troublesome inflow of water has appeared in the deepest drifts that have been yet opened. The heat has been found by boring to be 95·3° F. at a depth of 2,494 feet, indicating that the mines can be worked profitably to the depth of 3,000 feet; for the highest grades of ore, 3,500 feet. The hoisting of the ore is not expensive, as coal is abundant. The deep-level mining companies acquire several hundred mining claims of 1½ acre each, as is necessary to warrant the heavy expenditure for sinking shafts. Besides the main reef series there are other reefs in the Transvaal, especially of the kind called black reef, which is rich only in spots, and, on the whole, not likely to prove profitable to work.

African gold mines have been the object of extravagant speculation in London, and latterly in Paris. The French have invested £20,000,000 or £30,000,000 in the gold mines of the Transvaal, chiefly in the largest and most noted ones, and the English investments are perhaps four times as great. The deep-level mines are expected to bring the annual product of the Rand mines up to £10,000,000 in two years and to £12,500,000, when the maximum production is reached three or four years later. The total available supply from this district has been estimated at £325,000,000.

The Swaziland Settlement.—The Kingdom of Swaziland, which has an area of 6,150 square miles and a Kaffir population of 60,000, was declared to be independent in the convention concluded in 1884 between the British and the Transvaal governments. Boer graziers and British traders having gained a footing in the country by obtaining concessions from the native rulers during internal disturbances and wars with the Zulus, a convention was made in 1890 between the same parties whereby the government of the white population was committed to a mixed commission. In November, 1893, the British Gov-

ernment, in accordance with previous pledges, agreed that the South African Republic should take over the administration of Swaziland, native rights and customs being safeguarded and burcher rights conferred upon British settlers. This convention provided for the incorporation of Swaziland into the Transvaal, subject to the assent of the Queen-Regent and Council. There was a draft organic proclamation drawn up, which the Queen-Regent and the Swazi chiefs showed no signs of accepting; on the contrary, they sent a deputation to England to protest against the establishment of Boer rule and to offer their allegiance to Great Britain. An alternative arrangement was then embodied in a convention signed by Sir Henry B. Loch as High Commissioner and President Krüger on Dec. 10, 1894. This provided that, without the incorporation of Swaziland into the South African Republic, the Government of the South African Republic shall have and be secured in all rights and powers of protection, legislation, jurisdiction, and administration over Swaziland and its inhabitants, subject to the following conditions: That King Ungwane, or Ubunu, shall be recognized as paramount chief and exercise the usual powers in so far as they are consistent with civilized customs and law; that his private revenue shall be regularly paid over to him; that the management of the internal affairs of the natives shall be in accordance with their own laws and customs, including their law of inheritance, administered by their own chiefs, and the natives guaranteed in the occupation of land now in their possession and all the grazing and agricultural rights to which they are now entitled; and that no hut tax shall be imposed for three years, and in no case a higher tax than the Swazis in the Transvaal pay. The convention secures to all white residents the right to become naturalized as full burchers of the South African Republic, and forbids the sale of liquor to natives. No railroad is to be constructed by the Transvaal Government beyond the eastern boundary of Swaziland until the conditions shall be arranged in a further convention. The territory known as the Little Free State becomes a part of the South African Republic. The new convention denied the right of formal annexation, but at the same time it abrogated the proviso requiring the consent of the Swazi nation to the occupation of the country by the Transvaal. It was unanimously ratified by the Transvaal Volksraad on Feb. 13. The Swazi Queen having formally refused to sign the organic proclamation, the new treaty went immediately into operation. A proclamation was issued on Feb. 21, 1895, announcing that the Government of the South African Republic would take over the administration of Swaziland from that day. T. Krogh, the Boer representative on the joint committee of administration, was appointed Administrator. Gen. Joubert proceeded with troops to Bremersdorp to carry out the arrangements and install the young king as paramount chief. The party hostile to the Boers began to arm themselves and erect fortifications. A state of lawlessness and terror ensued. The Boers refrained from active measures, awaiting the decision of the king, who wavered between opposite counsels until he was

convinced that the English Government could not be moved. Then he submitted and was crowned as paramount chief at Imbalane on March 11. But later he renewed his protest and appealed anew to the British Government to make good the assurances of independence made to the late King Umbadine by Sir Evelyn Wood. He wanted to have the concessions by which Umbadine had alienated land, minerals, revenue, and administration investigated by a royal commission. When the Government of the Transvaal offered him £1,000 a month he refused to receive any money from the Boers, and threatened war and bloodshed if they attempted to impose their administration upon the Swazis, who would recognize no government except that of the Queen of England.

Native War.—A fresh dispute arose in the spring with the Makatso tribes settled upon the reservation in the Zoutpansberg district. In May Paramount-Chief Magato expelled the Government commission that had been sent to settle the difficulty and massed his warriors in the different strongholds. Gen. Joubert called out a commando of several thousand Boers and native allies to attack first the lesser chief Magoba, who had risen in open rebellion. Magoba's kraal was captured and afterward he and his followers were surrounded in the forest. The artillery shelled their camp, and then the Swazi allies took it by assault. The rebel chief was among the killed. The commando was dismissed then, leaving the difficulty with Magato to be settled by negotiation.

Portuguese South Africa.—The Portuguese possessions south of the Zambesi are organized as the province of Lourenço Marques, which forms with Mozambique the state of East Africa. There are 57 miles of railroad from Delagoa Bay to the Transvaal frontier. Outside of the district of Lourenço Marques the country has been conceded to the Inhamitanga Company and the Mozambique Company.

The native inhabitants are in a chronic state of revolt against the Portuguese authorities, who endeavor to protect the loyal and industrious tribes against the *impis* of the slave-hunting and predatory Kaffirs. The chiefs Maharula, Zihlahla, and Gungunhana rebelled against Portuguese authority in August, 1894, and harried the loyal tribes, attacked the Portuguese outposts, and raided the immediate vicinity of the town of Lourenço Marques. The British South Africa Company, which pays tribute to Gungunhana, offered the assistance of its troops to keep that chief in check, but the offer was declined. In the beginning of January, 1895, Maharula made another raid on the Matidag at Delagoa Bay. The Portuguese, having received re-enforcements from Europe and Angola, began their advance a fortnight later. They tried to surround Maharula and Zihlahla and marched up the Incomati river against Mariqueen, being joined by their native allies and supported by gunboats on the river. On Jan. 29 they defeated the rebels on the right bank, and drove them back in disorder as far as Mariqueen. On Feb. 2 the enemy entered their camp at dawn, treacherously displaying a flag of truce, and began to assagai the sleeping soldiers, killing 9 whites and 20 Angolans, and wounding a large number

before the troops formed a hollow square and repelled the natives with the aid of Maxim guns, killing 150. The troops burned kraals and occupied Maraqueen and other positions on the Incomati, but made no farther advance until the rainy season was over. A large proportion of the soldiers who were sent out from Portugal in the preceding October had died of fever; nevertheless 1,500 officers and men volunteered for the service and sailed for Lourenço Marques in March and April. The operations on the Incomati river were brought to a successful issue. The whole left bank was in the hands of the Portuguese by the middle of May up to Macaneta, where the chief Mahasul made a last, ineffectual stand. Military posts were established at Maraqueen and Incanhine and an armed police was organized. Mahazula retired with his men into Gungunhana's country.

The delimitation of the frontier between the Portuguese territory and the Transvaal was completed at the beginning of the year by a joint commission, of which Senhor Ennes was the Portuguese member. The dispute with the British South Africa Company in regard to the boundary of Manicaland has been referred to the arbitration of Italy.

German Southwest Africa.—The German possessions of Damaraland and Namaland, though 340,000 square miles in extent, have not more than 200,000 inhabitants. There were 1,200 resident whites in 1894. The protectorate is administered by an Imperial Commissioner. The supply of water is deficient, except in Damaraland, where there are good grazing grounds. The cost of the administration for 1894-'95 is set down in the budget at 1,027,000 marks, of which the 27,000 marks are raised locally and the rest contributed by the imperial treasury. The German commander, Major von François, had a force of 224 white soldiers in 1894. Unsuccessful attempts have been made to land goods at the mouth of the Swakop river. Valuable guano deposits were discovered in 1895 at Cape Cross, near Walfish Bay.

CARRIAGES, HORSELESS. The great horseless-carriage race from Paris to Bordeaux and return made in the spring of 1895, in which 4 people were conveyed in what the French call a *voiture automobile* a distance of 750 miles in time that made the average for the distance 16 miles an hour, at once turned the attention of all interested in the improved methods of locomotion, of which the bicycle has been a forerunner, to this method of getting over the ground without the use of man's universal friend, the horse. It appears that the application of steam has only temporarily settled the question of transportation. Horseless carriages have been used successfully in Paris for several years. Among the reasons that might make horseless carriages popular in the United States are the excessive cost of keeping horses, the cost of labor, and the same difficulties experienced in keeping a coachman that one encounters in his experience with domestic help. The principal reason against the adoption of the horseless carriage here so readily as in Europe is the condition of the roads. In England and France the roads are excellent; here they are the chief source of regret for bicyclists, pedestrians, drivers, and every-

body else that is compelled to use them. Then, too, the uneven formation of the country is against the use of a vehicle propelled by a motor, as unless a motor of tremendous power is provided there is always difficulty in climbing hills.

A horseless carriage resembles an ordinary carriage without shafts, except that it is somewhat more solidly built, and on closer examination it can be seen that it is furnished with what looks like the compartment under a dogcart, for the power, and has a handle in front of the driver's seat, by which it is steered. The horseless carriages first made themselves popular in Paris, that city of smooth and almost level pavements. At first their owners did not dare to trust themselves far; but soon with experience came confidence, and the journeys were extended to Versailles and St. Cloud instead of being limited to little trips about the Louvre and along

DOUBLE-CYLINDER MOTOR FOR HORSELESS CARRIAGE.

the Champs Élysées. It was found, too, that in point of speed and in ease in making journeys they were far ahead of those drawn by horses.

One of the most important questions in connection with the practical employment of the horseless carriage related to the power that should move it. The race from Paris to Bordeaux settled this, for all four of the prizes were won by *voitures* equipped with the motor that utilizes petroleum as a fuel. Steam, electricity, and naphtha were easily outstripped as a motive power by petroleum; for what was wanted was not a great power, but a handy and convenient one. Steam could easily furnish all the power wanted to propel a horseless carriage, or anything else, up even a Vermont hill; but the employment of steam is always somewhat clumsy, and there is oil and a boiler, a hot fire, escapes of vapor, an engineer, and various other inconveniences which it was desirable to avoid. A

steam carriage was made to compete in the Paris-Bordeaux race, but it weighed several tons, and its very strength militated against it. An electric horseless carriage was also got up for this race. This weighed several tons, and was impracticable. The race referred to definitely settled it, then, that one of the necessities of a horseless carriage is that it must be comparatively light. With petroleum there is no necessity for either an engineer or an electrician to be always in attendance when it is desired to take

one in most successful use in this country so far, is the motor that has been most successfully applied to the service of launches. This is a petroleum motor, which produces its power by a series of explosions in a cylinder or hot box, brought about by the mixture, at a certain temperature, of air and gas. The downstroke of the piston draws a current of hot air into the carburetor attached to the motor. The temperature of this current causes generation of vapor from gasoline contained in the carburetor and

A HORSELESS CARRIAGE, WITH PETROLEUM ENGINE.

a trip, as the knowledge necessary to enable one to take entire charge of a petroleum motor is so slight that it is not a matter for serious consideration. Petroleum has the further advantage of not having any of the inconveniences of steam, such as blow or waste pipes, a boiler, or a furnace, or the friction resulting from the exercise of such power as steam exerts, and the consequent need of constant oiling, while there is absolutely no danger of explosions.

The Motor.—The prize-winning motor of the Paris-Bordeaux and return races, and the

its entry into the cylinder. Between the carburetor and the cylinder a cold-air pipe is attached to the suction pipe, which is opened or shut by an admission valve. It needs a certain proportion of air and vapor to secure an effective explosive mixture, and, by opening the admission valve more or less, the proportion of this mixture is regulated. The upstroke of the piston forces the explosive mixture into the platinum tube attached to the explosion chamber above the cylinder. The platinum tube is heated by a small lamp, the only fire used. This flame ig-

nites the explosive gas, thus creating a sudden expansion of it, which forces the piston down again. The second upstroke in the cylinder exhausts the expanded gases through a pipe opened by a valve at every second stroke only. The exhaust pipe is opened at the rear of the carriage, and the motion carries any disagreeable odors away from the occupants of the vehicle. The double-cylinder motor is the kind most employed. To start the motor a little crank must be turned half a dozen times, sometimes as much as half a minute, to enable the machine to begin its explosions. This constitutes the only serious objection to it. The motor has no explosive force on hand, and requires no safety valve, like steam. When a motor is stopped or shut off it is dead, and there can be no effort on its part until half a dozen turns of the crank have sucked in a mixture of gas and air to begin over again a series of explosions in the cylinders. The efforts that are being made by inventors to do away with the disadvantage mentioned may be appreciated, when it is said that in the large motors of this kind for use in mills and like heavy establishments the engines of 100 horse power obtain the start by the use of several smaller engines. Of course it would be futile to attempt to start by hand an engine of 100 horse power. The smallest of these engines is not too large to be started by hand. This smallest engine, as soon as it has got its own power, in turn sets the second one, and that starts the main machine.

Hitherto it has been necessary to carry on a journey in one of these horseless carriages at least a barrel of water for cooling the cylinders. A new device, by which a smaller quantity will be sufficient, consists of an arrangement by which the water used to cool the cylinders is re-cooled almost as soon as it is used, and then made to play its part over and over again. The quantity of fuel used is not worth making any effort to reduce, as it is only a pint of petroleum an hour to each horse power. Three horse powers was the capacity of the winner at the last Paris race. The most successful of the devices thus far for doing away with the inconvenience in starting the machine is a contrivance, now popular in Paris, of a gearing by which, when the carriage is stopped for a few minutes, a small wheel takes the power and continues the engine in motion, but with the power not applied to the wheels of the wagon.

Two large firms in Paris are very busy supplying the demand for horseless carriages. One makes carriages with wooden spokes, while the other produces a vehicle with the steel spokes that characterize the bicycle. It was one of the latter, carrying 4 persons, that won the special prize in the great French race. The 750-mile journey was made by a wagon carrying 2 persons in forty-eight hours and fifty-three minutes. A factory for the manufacture of horseless carriages has been established at Steinway, Long Island, near Astoria.

CHEMISTRY. Chemical Theory.—Prof. Raphael Mendola, opening the chemical section of the British Association with an address on the progress of chemical science, remarked that the recognition of the quantivalence of carbon by Kekule in 1858 was the beginning of the

recent development of chemical science. The conception of the valency of the atoms was broached by Frankland in 1852, and shortly after that time the course of discovery began to concentrate itself in two channels: one following the physical side, and the other carrying "the tide of discovery arising from the valency doctrine and its extension to the structure of chemical molecules." The two channels are at present fairly parallel and not far apart. We have one class of workers dealing with the physics of matter in relation to general chemical properties, and another class of investigators concerning themselves with the special properties of individual compounds and classes of compounds with atomic idiosyncrasies. The workers of one class are differentiating, while their colleagues are integrating. Both methods are necessary for the development of the science; and there is no antagonism, but co-operation.

The success attending the application of the doctrine of valency to the compounds of carbon has helped its extension to all compounds formed by other elements, and the student of the present day is taught to use structural formulas as the A B C of his science. The doctrine in its present state is empirical, but we can hardly doubt that a physical reality underlies it. There is something to be reckoned with besides valency. The great desideratum of modern chemistry is a physical or mechanical interpretation of the combining capacities of the atoms. The services of the doctrine of Valency, however, in the construction of rational formulas, especially within the limits of isomerism, have been incalculable. The doctrine underwent a prolific development through the introduction of the stereochemical hypothesis in 1874; and renewed vitality was given it by the conceptions of tautomerism and deomotropy, formulated by Laar in 1885, and by Paul Jacobson in 1887. A more recent development of structural chemistry is the conception of certain ideal complexes of atoms which we consider to be the nucleus or type from which the compound of known constitution is derived. In some cases these types have been shown to be capable of existence; in other cases they are still ideal. The parent compound has sometimes been known before its derivative, as in the case of ammonia and the organic amines and amides; and in other instances the derivatives were obtained before the type was isolated, as in the case of the hydrazines, which were characterized in 1875, and the hydrazo compounds, which have been known since 1863, while hydrazine itself was only first obtained in 1887. This theory is also capable of almost indefinite extension. The present position of structural chemistry may be summed up in the statement that we have gained an enormous insight into the anatomy of molecules, while our knowledge of their physiology is as yet in a rudimentary condition.

The theory is sustained by Dr. T. L. Phipson that the atmosphere was originally of nitrogen only, and the free oxygen which now forms part of the air we breathe is entirely the product of plant life extending over countless ages—not that plants were the creators of oxygen, but that they were the means by which Nature has placed free oxygen gas in the atmosphere of the

earth. Palaeontologists generally admit that the lowest forms of plant life were the first to make their appearance; on these, of course, would have devolved the function of preparing an atmosphere fit for the existence of animals. The author has again, in experiments carried on during the summer of 1894, confirmed his hypothesis that the lower forms of plant life are precisely those which produce oxygen most rapidly and most abundantly. Between green plants, which are essentially anaerobic, and the more perfect animals, beings which are just as essentially aerobic, there exists a vast intermediate class presenting more or less the characteristics of both, such as the various organized ferments, fungi, bacteria, etc., which represent the gradual transformation of the anaerobic cell into the aerobic cell under the influence of the gradual change of medium—that is, the constantly increasing amount of free oxygen in the atmosphere since the earlier geological ages. An experiment is described by the author in which green unicellular algae, bottled and exposed to the sunlight every day at a temperature of from 48° to 63° F., produced oxygen at a rate represented by 430 gallons a year, or 42,000 gallons in a century.

Chemical Physics.—The behavior of gases in electrification and the influence of moisture in their combination was discussed in the chemical section at the recent meeting of the British Association. Prof. J. J. Thomson exhibited experiments showing the connection between chemical change and electrical discharge through gases. The gases were confined under pressure in glass bulbs which were exposed to electrical action. As each spark passed between the poles of the machine a rapidly alternating current was set up in the coil, and hence by induction in the gas. Moist oxygen gave a vivid incandescence, followed by an afterglow or phosphorescence on removing the bulb from the coil. With the dry gas, incandescence did not take place; it could, however, be started in the dry gas by a brush discharge, and, if once started, continued under the influence of the current. With air the phenomenon is reversed; damp air does not glow, dry air does. By making use of two coils, in one of which was a beaker of fairly strong sulphuric acid, and in the other a bulb containing moist oxygen, the presence of the acid was shown to prevent the incandescence in the bulb, indicating that the conductivity of the gas was much greater than that of the acid. As the glow is only given in gases forming polymeric modifications, it is suggested by the author that the drops of water present may act as conductors, causing the original molecules to dissociate. With gases this preliminary dissociation can be brought about only by the expenditure of a large amount of energy. Alcohol vapor will act similarly to water, and it becomes of interest to study other solvents. Mr. Brewster Baker followed with experiments on the influence of moisture on chemical changes. He showed that ammonia and hydrochloric acid when dry do not combine. Tubes were exhibited containing dry sulphur trioxide and cupric oxide and dry sulphur trioxide and lime side by side without acting upon one another. He has obtained analogous results to those of

Prof. Thomson by using vacuum tubes, into one end of which a platinum wire was fused, and which contained a small quantity of mercury; on shaking the tubes in a dark room incandescence took place in those containing moist oxygen. This is less if nitrogen is present, and ceases if the gas is dry. For the explanation of these results, Mr. Baker is inclined to the physical view of the matter suggested by Vernon Harcourt rather than to the chemical one proposed by Dixon. He has long believed in an electro-chemical theory of combination; hence he considered it desirable to ascertain whether molecules capable of combining are at different potentials, and whether the difference of potential increases as they are brought nearer to the point of union; and whether the conditions that affect chemical change affect in the same direction the passage of the electric discharges. Experiments were performed which showed that mixed gases can be partially separated by the attraction of their molecules for oppositely charged plates. Hence it seems probable that the molecules themselves are charged. Moreover, experiment showed that the electric discharge takes place more readily in moist than dry air; and, further, that the electric glow obtained by shaking mercury in different rarefied gases gradually diminishes as the gas is dried by phosphorous pentoxide, and finally disappears. Hence the author concludes that in the presence of moisture electric discharge is affected in the same way as chemical combination. If it can be regarded as proved that substances which are capable of chemically combining are electrically charged, the great significance of this result is obvious.

Attention is called by Dr. G. E. Quinke to the fantastic forms assumed by combinations of alkalis and oleic acid when brought into contact with water. Oleic acid with a little alkali, or containing an acid oleate of an alkali in solution, forms in much water hollow spheres, globules, and foam, with walls of liquid oleic acid. The hollow spaces are filled with aqueous soap solution. When more water is added, the walls are covered with a solid skin of the acid oleate, which may then become quite liquid again by decomposition into liquid oleic acid and aqueous soap solution. The periodic flow of soap solution at the surface separating liquid oleic acid and water produces vortex motions, which may be made evident with methylene blue or other coloring matter. More hollow spheres and bubbles of oleic acid are formed, which are arranged by the capillary forces on the larger bubbles in definite positions, such as straight lines, circles, and ellipses. An analogy is pointed out in Dr. Quinke's paper between this arrangement and the configuration of various small portions of the stellar universe, such as parts of Orion, Virgo, and Coma Berenice, and Piazzi's experiments with weightless oil spheres illustrative of the generation of the solar system is recalled. The author also emphasizes the fact that the protoplasm of the organic world shows a structure and motion similar to those of oil foam with liquid or solid surfaces.

The critical temperature of hydrogen has been determined by M. Olszewski to be -234.5° C., and its boiling point -243.5° C., or -406.3° F.

As to the laws of solubility, A. Belohoubek, of Prague, has shown: 1, that of organic substances consisting of carbon and hydrogen, with or without oxygen, substances free from oxygen are insoluble in water; 2, the richer a compound in oxygen the more soluble it is in water; and, 3, bodies dissolve each other better the more closely they resemble each other in structure. In illustration of the third rule C. T. Blanchard observes that simple compounds are soluble in water, more complex compounds in more complex liquids, like alcohol, benzene, etc. The law, originally applied by its author to organic substances, admits of extension to all bodies, whether elements or compounds. Thus many metals, as palladium, are soluble in hydrogen. A still larger number are soluble in carbon, as iron, manganese, nickel, and aluminium. Metals also dissolve in one another, sometimes to an indefinite extent, but very generally to form alloys of definite constitution capable of crystallizing. This is exactly analogous to salts crystallizing with definite amounts of water. Again, nonmetals, which are, as a rule, insoluble in water, dissolve in various organic substances, as benzene, carbon disulphide, etc. Metals which dissolve in each other and in hydrogen, or the element carbon, are insoluble in such complex bodies. It follows, therefore, that nonmetals from the point of view of solubility are more complex, and therefore more highly evolved substances than metals. Sulphates, which are not of such simple structure as chlorides or bromides, or even as nitrates or chlorates, having more atoms in the molecule, are, as a rule, less soluble.

New Substances. Argon and Helium.—The announcement by Lord Rayleigh and Prof Ramsay of their discovery of a new constituent in the atmosphere which they named argon was recorded in the "Annual Cyclopædia" last year. A further communication concerning the newly discovered element was made by the authors at a public meeting of the Royal Society held Jan. 31, when the properties of argon were described so far as they had been discovered and its possible place in Mendeleef's periodical system was discussed. Lord Rayleigh's attention was directed to the inquiry which resulted in this discovery by observing, while engaged in the determination of the densities of some of the more permanent gases, that nitrogen when extracted from the atmosphere was about one half per cent. heavier than when obtained from chemical compounds. Prof. Ramsay became interested in the research, and the two, each investigating in his own way, produced argon by different methods about the same time. It can be separated from the atmosphere and from the nitrogen, which it much resembles, by atmylosis, or absorption in porous bodies, and by "sparking," or the operation of the electric spark. It proves to be an inert gas, generally refusing to enter into combination with other substances, having a density of about 19.7; is very soluble in water, it having been found that the nitrogen extracted from rain water is twice as rich in argon as that which exists in the air; and has been shown by Mr. Crookes to have two spectra, marked by red and blue lines respectively. As determined by Prof. Olzewski, its critical temperature is -126°C. , and

its critical pressure 50.6 atmospheres. It boils, under a pressure of 740.5 millimetres, at -186.9°C. , and has a density at the boiling point of about 1.5. It has been frozen into a white solid of which the melting point is about -189.6°C. The ratio of its specific heats, 1.66, points to the conclusion that it is monatomic. The question next arises, whether it is an element or a mixture of elements. Mr. Crooke's observation of the dual character of its spectrum bears in favor of the view that it is a mixture; Prof. Olzewski's determinations of definite boiling and melting points and critical temperature bear as directly and more forcibly against that view; and the authors regarded the balance of the evidence as pointing to simplicity. Its atomic weight, as calculated from its density by Avogadro's law, is 40. If this be correct and it is monatomic, no place is found for it in the periodical scale. Were it diatomic, and its atomic weight 20, it might find a place between fluorine, 19, and sodium, 23. Of this aspect of the subject, the authors said in their paper: "If argon be a single element, then there is reason to doubt whether the periodic classification of the elements is complete; whether, in fact, elements may not exist which can not be fitted among those of which it is composed. On the other hand, if argon be a mixture of two elements, they might find a place in the eighth group, one after chlorine, and one after bromine."

Prof. Mendeleef, discussing the constitution and place of the new substance, dismisses the supposition of its being a mixture as lying beyond all probabilities. He then discussed the series of possible molecular formulas, $A, A_2, A_3, \dots A_n$. If it were A , no more could be found for it in the periodic system. Upon the second supposition (A_2) it would find its place in the eighth group of the second series, or after fluorine, but this supposition, too, was liable to strong objections. Much, however, might be said in favor of a third hypothesis, that the molecule of argon contains three atoms, and that its atomic weight is about 14, whence it might be considered as condensed nitrogen, N_3 . On the supposition that the molecule contains five atoms and its atomic weight is 10 or 8, no place is found for it in the periodic system; but if the molecule be supposed to contain six atoms, and the atomic weight be 6.5, the element might find a place in the first series, probably in the fifth group. The author considered this supposition and the one that gives the molecular formula N_3 as the more probable ones.

The supposition that argon is an allotropic form of nitrogen was suggested by Prof. Dewar on the first publication by Lord Rayleigh and Prof. Ramsay. Similar views have been expressed by Prof. T. L. Phipson, M. Berthelot, and Prof. Brauner, of Prague.

Experimenting with a small quantity of argon sent him by Prof Ramsay, M. Berthelot found that under the influence of the silent electric discharge it would combine with certain organic compounds, and notably with benzene, with which 83 per cent. or five sixths of the argon was condensed in chemical combination. The products of the combination resembled those produced by the silent discharge acting on nitrogen mixed with the vapor of benzene,

consisting of a yellow, resinous, odorous matter condensed on the surface of the two glass tubes between which the electric action is exerted. This substance submitted to the action of heat decomposes, forming volatile products and leaving a carbonaceous residue. The volatile products of the decomposition turn litmus paper blue, indicating that an alkali is formed. The author observes, in his paper, that the conditions under which argon is condensed by hydrocarbons tend to assimilate it still closer to nitrogen. M. Berthelot found in this research that the action of the silent discharge was accompanied with a faint violet glow, visible in darkness; and on one occasion a fluorescent body was formed which gave out a magnificent greenish light and a splendid spectrum. After a more complete spectroscopic examination of the light, in which M. Deslandres assisted, the conclusion was drawn that the fluorescence is due to a condensation compound of argon, and that it points to the probable existence of a complex state of equilibrium in which argon, mercury (which is used in the course of the experiments in which the fluorescence is developed), and the elements of benzene, or rather a compound condensed from it, are concerned.

Prof. Ramsay's attention was directed, while he was seeking clues to compounds of argon, to the gas which Hillebrand had found given off on warming the Norwegian mineral *clérite*, and which was supposed to be nitrogen. The gas, however, proved to be almost free from nitrogen, but to exhibit the spectrum of argon, together with some other lines, one of which, in the green-blue, was specially prominent. Mr. Crookes, examining the gas spectroscopically, found that this line, to which his attention was specially directed, corresponded with the line D₂ of the spectrum of the solar chromosphere, which is regarded as indicating the presence of an element there not hitherto known on the earth, to which the name helium has been given. The same helium line was also identified at about the same time in Prof. Cléve's laboratory at Upsala. *Clérite* being an uranium mineral, other minerals containing that element were examined for the presence of helium. Prof. Lockyer found it in *bröggerite*. Fifteen out of about 30 minerals studied by Prof. Ramsay, J. M. Collier, and M. Travers were found to contain helium; and the investigation generally indicated that helium is retained by minerals consisting of salts of uranium, yttrium, and thorium; but whether its presence is conditioned by the uranium, the yttrium, or the thorium can not yet be decided. Meteoric iron, heated in a vacuum has yielded to Prof. Ramsay small amounts of argon and helium, and comparatively large quantities of hydrogen. Free argon and helium have been found by M. Ch. Bouchard in the gases liberated from certain of the sulphurous waters of the Pyrenees. P. P. Bedren and S. Shaw have found that the nitrogen given off by the brine of Middlesborough, England, contains about the same proportion of argon as does atmospheric nitrogen. Magnesium vapor, when it was submitted to the silent discharge by L. Troost and L. Ouvrard, rapidly combined with nitrogen. Continued action after the spectroscopic evi-

dence proved the absence of nitrogen resulted in the gradual diminution of the intensity of the helium and argon rays, till finally a complete vacuum was produced. Hence it appeared that magnesium would combine with helium and argon under these circumstances. Platinum seems to behave like magnesium toward argon when exposed to the silent discharge in Pliicker tubes. Experimenting with argon and some elements which combine more or less readily with nitrogen—titanium, boron, lithium, uranium, and fluorine—M. Moissan obtained only negative results.

Prof. Ramsay supposes that a close analogy exists between argon and helium; and that their properties place them in the same chemical class and differentiate them from all known elements. From the properties of certain lines in their spectra he supposes that they contain some common element; and there appears to be a place for such an element with a density 10 and an atomic weight 20 to follow fluorine in the periodic table. The density of helium, however, is so low that there does not appear to be room for a large quantity of a heavier gas; and to fit the periodic table, the density of argon should rather be diminished by removal of a heavier admixture than increased by removal of a lighter one. The observations of Dr. Gladstone indicate the atomic weight 20 for argon, and suggest that its place is in the vicinity of the alkali metals. C. Runge and F. Paschen find a close analogy between the spectra of these elements and those of the alkalies. Their experiments lead them to believe that the gas in *clérite* consists of two, and not more than two constituents, of which they propose to call only one helium—the one to which the bright-yellow double line belongs, whose spectrum is altogether the stronger one—while the other ought to receive a new name.

The researches of M. Lecoq de Boisbaudran into the relation among the atomic weights of the elements led him some time ago to suppose the existence of a family of elements no number of which was hitherto known, and of even, or octo, atomicity; whose component elements should be devoid of the faculty of combining with other elements. Among these elements he supposed two, having the atomic weights 30.045 and 36.40, which should be relatively abundant in Nature. A similar suggestion was made by Mr. C. J. Reed in papers read before the American Association for the Advancement of Science, and the St. Louis Academy of Sciences, in 1885. Besides those places mentioned by M. de Boisbaudran, his classification had a place corresponding with the atomic weight 4. The existence of an element without valency of the atomic weight of argon was suggested by Lieut.-Col. Sedgwick, late R. E., in a paper sent to the Royal Society in November, 1892.

These speculations are in harmony with a remark by Prof. Lockyer in describing some of his experiments with helium, that "we appear to be in presence of the *vera causa*, not of two or three, but of many of the lines which, so far, have been classed as 'unknown' by students, both of solar and stellar chemistry; and if this be confirmed, we are evidently in the presence of a new order of gases of the highest importance in celestial chemistry, though perhaps they

may be of small practical value to chemists, because their compounds and associated elements are, for the most part, hidden in the earth's surface."

From the wave length of sound in the gas, from which the theoretical ratio of specific heats 1.66 is approximately obtained, the conclusion is drawn by Prof. Ramsay that helium, like argon, is monatomic. M. Ōlzewski has not been able to liquefy helium, though he subjected it to a pressure of 140 atmospheres, cooling it to the temperature of air boiling at low pressure, and expanding suddenly. Its atomic weight is fixed by Prof. Ramsay at 4.36.

The lower sulphide of carbon, CS, has been obtained by Dr. Deninger, of Dresden, in considerable quantities by heating anhydrous sodium sulphide and excess of chloroform in exhausted sealed tubes to about 180° C. Sulphureted hydrogen, hydrogen chloride, and the new gas were obtained. The gas is combustible, burning with the production of sulphur dioxide, and is very explosive; it is energetically absorbed by alcohol and aniline, and readily condenses to a liquid in an ordinary freezing mixture. It is also obtained by heating in sealed tubes a mixture of silver sulphide and iodoforn.

The investigation of the new iodine base Iodonium has been continued by pupils of Prof. Victor Meyer. A base and its salts derived from toluene are described by Mr. John McCrae, and a further series derived from para-chlor-iod benzene, C_6H_4ClI , by Mr. Wilkinson. From the various experiments it appears that the reactions discovered by Prof. Meyer and Herr Hartmann between iodobenzene and silver oxide, and between sulphuric acid and iodobenzene, which resulted in the preparation of the first Iodonium base, are of fairly general application in the benzene series. These remarkable compounds containing iodine as the grouping element, must now, therefore, be regarded as thoroughly well established, and the older idea as to the nature of the iodine atom must give place to a fuller conception of the capabilities of that element.

Prof. Joly, of the Paris École Normale, has investigated the compounds of ruthenium, principally those resulting from an association of this element with binoxide of nitrogen, a combination which, behaving as a single body, unites with chlorine, bromine, iodine, and oxygen. He finds it to be, of all known elements, that which presents the most original properties. He has exhibited a red coloring matter, resulting from an association not yet definitely determined (oxychloride of ammoniacal ruthenium), giving a tinctorial power equivalent to that of the richest dye materials obtained from coal tar, to that of fuchsine, for instance. A five-millionth part of the substance suffices to color water. It dyes silk directly, and the color thus procured is stable. The chemical reactions of this new coloring matter are equally interesting. Acids transform it into yellow, and alkalis bring it back to red.

Dr. Bayer describes in the "Bulletin de la Société Chimique" what appears to be a new element discovered by him in the residual liquors derived from the older process for the extraction of aluminium from red bauxite. It

occurs in the form of an acid contained in a deep-brown precipitate obtained by adding hydrochloric acid to the liquid left after the vanadium and chromium have been removed. After a series of processes for the removal of other substances, the new acid is obtained by evaporation—a substance soluble in water, from which it is deposited in yellow crystals that fuse at a red heat to a brownish-yellow mass. Ammonia transforms the acid into an olive crystalline powder, presumably an ammonium salt, which readily dissolves in hot water and crystallizes in cubes from the solution on cooling. Other precipitations and reactions are described. Dr. Bayer anticipates that when the new substance has been obtained in sufficient quantities to allow accurate examination it may prove to be one of the missing elements predicted by Prof. Mendeleef in the nitrogen-phosphorus group. It exhibits characteristic spectroscopic lines in the green, blue, and violet.

A new organic acid described by H. J. H. Fenton is obtained by oxidizing tartaric acid under certain conditions in presence of a ferrous salt—in this particular instance by the oxidation of moist ferrous tartrate in the air. The reaction is much accelerated by light. The acid when isolated proves to be dibasic having the formula $C_4H_4O_6 + 2H_2O$. It gives a beautiful violet color with ferric salts in presence of an alkali. Heated with water it is resolved into carbon dioxide and glycolic aldehyde, the latter substance polymerizing to form a sweet-tasting gum having the formula $C_4H_{12}O_6$.

Several aromatic esters of arsenious acid, prepared for the first time by Dr. Fromm, of Rosstock, are either viscous liquids or crystalline solids, and are prepared with considerable facility. The triphenyl ester, $As(OC_6H_5)_3$, is obtained by allowing arsenic trichloride to fall drop by drop into sodium phenylate suspended in ether. It is a colorless viscous liquid endowed with an odor somewhat resembling that of phenol, and is decomposed instantly by water into arsenious oxide and phenol. The para-cresyl ester, $As(OC_6H_4CH_3)_3$, is similarly obtained, is likewise an oily liquid boiling at a higher temperature, and has similar properties. The benzyl ester, $As(OCH_2C_6H_5)_3$, has been isolated in an analogous manner, but is not quite so stable as the others, being more or less decomposed upon distillation in a vacuum. It may be obtained practically pure by heating the product of the reaction in an oil bath to 200° C. under low pressure. It reacts with water similarly to the two other esters. In addition to these liquid aromatic arsenious esters, the β -naphthyl ester, $As(OC_{10}H_7)_3$, has been prepared by the action of arsenic trichloride upon the sodium derivative of β -naphthol. It crystallizes from the ethereal solution after decantation from the precipitated common salt, in colorless aggregated crystals, which melt at from 113° to 114° C., and are readily soluble in alcohol and benzene as well as in ether. Water immediately decomposes them, and in boiling water the products of the decomposition—arsenious oxide and β -naphthol—dissolve completely.

New Processes.—Anhydrous hydrogen peroxide, isolated by Dr. Wolfenstein, proves, contrary to the previous belief, to be stable and

capable of distillation under reduced pressure, with little loss. In attempting to concentrate solutions of hydrogen peroxide in a vacuum and also in the open air upon the water bath, a solution as strong as 66 per cent. H_2O_2 was obtained, but with a loss of more than 70 per cent. of the original amount of peroxide employed. Moreover, it was found that when the common commercial 3-per-cent. solution is concentrated, the percentage of H_2O_2 may be brought up to 45 without the loss of any considerable quantity by volatilization, but that as the concentration continues to rise above this limit the volatilization of the peroxide increases at a very rapid rate, for the great loss was proved to be due not to decomposition, but to actual volatilization of the substance. Hydrogen peroxide appearing to be stable at the temperature of the water bath, an attempt was made to distill it under reduced pressure. A quantity of commercial hydrogen peroxide concentrated till it contained 50 per cent. of H_2O_2 was subjected to a succession of fractional distillations, when a portion distilled at 84° to 85° C. proved to be practically pure H_2O_2 , having a strength of 99 per cent. The liquid thus isolated is a colorless sirup which exhibits but little inclination to wet the surface of the containing vessel. When exposed to the air it evaporates. It produces a prickly sensation when placed upon the skin, and causes the appearance of white spots that take several hours to disappear. The experiments are regarded as establishing the acid nature of hydrogen peroxide.

The explosive properties of the sodium and potassium derivatives of nitromethane have been well illustrated in experiments by Prof. Zelinsky, of Moscow. The sodium compound, CH_3NaNO_2 , is prepared by Victor Meyer by diluting a quantity of nitromethane, CH_3NO_2 , with ether and treating the liquid with a solution of sodium in alcohol, when the compound is precipitated. Prof. Zelinsky employs essentially the same process, except that he uses an alcoholic solution of sodium ethylate as a precipitating agent. Being desirous of obtaining the compound anhydrous, he sought to achieve his object by the use of the water bath, carefully taking in his preliminary test only about a grain of the substance. Within five minutes an explosion occurred by which the watch glass supporting the substance was pulverized and the water bath seriously injured. An explosion always results, according to Prof. Zelinsky, from the contact of the dry sodium compound with a minute quantity of water. An assistant placing about 5 grains of the substance in a glass, the surface of which was moist, the explosion which instantly occurred shattered every piece of apparatus upon the table, and all the gas flames in the laboratory were extinguished by the atmospheric wave caused. The assistant only sustained a trifling injury. The potassium compound, CH_3KNO_2 , is prepared in a similar manner to the sodium compound, and is still more unstable, exploding at the ordinary temperature shortly after its isolation. It separates in well-defined crystals upon the addition of the potassium ethylate. The crystalline form, however, soon disappears, and upon rapidly transferring to a filter an explosion invariably occurs as

soon as the compound becomes drained free of most of the mother liquor.

M. Moissan has been making a more exact study of the properties of titanium, of which little is known on account of the difficulty of obtaining the element in a state of sufficient purity. The powder the form in which it usually occurs is produced by the action of the alkaline metals on the fluotitanates, and contains nitride of titanium (the metal having a marked affinity for nitrogen), potassium or sodium, oxygen, and silicon. The reduction of vanadic acid and silica in the electric furnace suggested to the author that titanate acid might be decomposed in the same way. The result of the experiment varied according to the intensity of the arc employed. With an electric arc produced by a machine of only a few horse power, a blue crystalline powder of protoxide of titanium was obtained; with a machine of 45 horse power, a yellow substance with a bronzy fracture composed of nitride of titanium. A definite and crystallized carbide was also prepared. Finally, by subjecting a mixture of titanate acid and charcoal to the action of an arc produced by a machine of from 100 to 300 horse power he obtained melted titanium. This metal is the most refractory substance that M. Moissan has so far obtained by the aid of the electric furnace. It is more difficult to fuse than pure chromium, tungsten, molybdenum, uranium, or zirconium. It is extremely hard and cuts the diamond. When the mixture of titanate acid and charcoal was placed in the crucible of the electric furnace exposed to an arc produced by a machine of 300 horse power, the upper part of the product for a thickness of 1 or 2 centimetres was fused titanium; beneath this was a layer of the nitride, and under this the blue protoxide. A casting was prepared containing 2 per cent. of carbon. Titanium prepared in this way has a slighter affinity for nitrogen than the powder resulting from the action of an alkali metal on the fluotitanates. This pulverized titanium burns in nitrogen at a temperature of 800° C.; it combines at the moment of incandescence with oxygen at a red heat. It does not decompose the vapor of water except at a temperature above 700° C. Titanium unites readily with iodine to form an iodide, and is soluble in lead, copper, and iron. M. Moissan adds that in respect to other properties it resembles the metalloids, especially silicon.

From acetylene it is possible, as is shown by Prof. Vivien B. Lewes, to build up all the other hydrocarbons that can be used for illuminating purposes. For instance, if acetylene be passed through a tube heated to just visible redness, it is rapidly and readily converted into benzol; at a higher temperature, naphthalene is produced, while by the action of nascent hydrogen on acetylene benzene and ethane can be built up. From the benzol we readily derive aniline and the whole of that magnificent series of coloring matters that have been produced from that substance; while the ethylene produced from acetylene can be readily converted into ethyl alcohol by consecutively treating it with sulphuric acid and water, and from the alcohol again an enormous number of other organic substances can be produced; so that acetylene can, without exag-

geration, be looked upon as one of the great keystones of the organic edifice. With a cheap and easy method of preparing it, such as seems to be afforded by the calcium-carbide process, it is hardly possible to foresee the results which may be ultimately produced. The most valuable application of acetylene promises to be to purposes of illumination, for which it has many advantages over coal gas. It has been shown by experiment that it is twelve times as efficient in producing light as the best gas now in use for that purpose, a consumption of 5 cubic feet per hour furnishing a light of 250 candle power, while an equal amount of common gas will give a light of only 20 candle power. Further, only about one sixth as much oxygen is consumed as in obtaining an equal amount of light by the usual methods. The gas is poisonous when breathed, but its presence may be readily detected by its characteristic heavy odor of garlic.

A new and very convenient method of preparing the unsaturated hydrocarbon allylene, C_3H_4 , by means of the action of magnesium on the vapors of the alcohols is described by Prof. Keiser and Miss M. B. Breed. The process has been employed with methyl and ethyl and other alcohols, but with none of them is the gas so pure as that derived from the use of propyl alcohol. When this substance is used the new method is said to be far preferable to the ordinary one of decomposing propylene bromide with alcoholic potash.

Persulphuric acid and its anhydride were first obtained and described by M. Berthelot, and its potassium, ammonium, and barium salts were prepared in 1891 by Dr. Marshall, of Edinburgh. A second memoir by M. Berthelot on the acid and its salts confirms Dr. Marshall's results, and includes a description of the method of preparing the acid by electrolysis of a solution in dilute sulphuric acid of potassium or ammonium sulphate, accordingly as the potassium or ammonium salt is required, in the inner cell, and dilute sulphuric acid in the outer cell. At the expiration of fifteen or twenty hours, the inner cell will contain large quantities of beautiful crystals of the persulphate. Crystals of the salt are also obtained by direct electrolysis of sulphuric acid and subsequent addition to the product of a concentrated solution of potassium bisulphate; and by the gradual addition of anhydrous barium peroxide to concentrated sulphuric acid. Potassium persulphate attacks mercury at ordinary temperatures, with production of a yellow basic sulphate that appears to be identical with the salt called *turpeth mineral*.

Atomic Weights.—Bohuslav Brauner's latest calculations of the atomic weight of tellurium give the number 127.71, which is higher by 0.86 than the atomic weight of iodine, 126.85, whereas, from its position in the periodic system, tellurium should have an atomic weight between 123 and 125. On this account the author is led to the conclusion that it is not a simple substance, which is supported by the following considerations: 1, tellurium precipitated and dried in a current of an inert gas gives higher value for the atomic weight than when sublimed in hydrogen; 2, the properties and composition of the dibromide; 3, the varying results obtained on attempting the synthesis of the dioxide, the

basic sulphate, and certain metallic tellurides; 4, the behavior of tellurous and telluric acid solutions toward hydrogen sulphide.

The atomic weight of tungsten has been revised by Prof. E. P. Smith, of the University of Pennsylvania, by means of 2 series of experiments performed by 2 assistants. The mean value derived from the first series, of 9 experiments, was 184.92, taking oxygen as 0.16; and from the second series of 6 experiments, 184.70. The highest and lowest values obtained in the first series differed only 0.02, and in the second series only 0.07 from the mean. Striking the medium between these two means gives 184.8 as a close approximation to the true atomic weight of tungsten. This value is considerably higher than the currently accepted one, 184.02, the number afforded by Clarke and Becker's recalculation of the results of older determinations. The increase is probably due to the great pains which were taken to remove the traces of molybdenum from the tungstic acid used in the experiments.

That nickel and cobalt should have the same atomic weight, as they have appeared to have from past analyses, seems at variance with Mendeleef's law, and many efforts have been made to secure greater accuracy in the estimations. Prof. Winkler has recently made analyses of cobalt by methods which he declares were quite unimpeachable, and publishes as the results of two series, each consisting of several individual determinations, carried on with an interval of some months, and with metals from independent mineral deposits—Ni = 58.72, and Co = 59.37, when H = 1 and I = 126.83. This gives cobalt an atomic weight at least half a unit higher than that of nickel.

The value, 87.70, for the atomic weight of strontium, found by Pelouze in 1845, has been confirmed by T. W. Richards. Pelouze's method was found on a comparison of anhydrous strontium, chloride, and silver. Richards used anhydrous strontium bromide and silver, and took the results of 3 sets of analyses carried on by different methods.

Chemical Analysis.—Numerous analyses of sea water show that while salinity, or the amount of dissolved salts contained in 100 parts of the water, varies greatly in different regions of the ocean, the composition of the dissolved salts—or the ratio of the constituents of sea salts—remains practically the same in all the superficial marine waters. Consequently, it is only necessary to determine the chlorine in a given weight of water to ascertain at once the respective quantities of other salts present in the sample. It appears, however, from Dittmar's examination of the "Challenger" waters, that lime is slightly more abundant in samples of sea water collected in greater depths than in samples collected nearer the surface of the ocean. Some evidence appears too of slight differences in the composition of the sea salts. There is also abundant evidence that changes in chemical composition take place in the substances deposited on the floor of the ocean; and with the view of throwing some light on the manner in which these changes are brought about, Dr. John Murray and Robert Irvine have examined the composition of the water associated with marine de-

posits on the floor of the ocean or with the blue mud. The experiments indicate that during the process of decomposition the greater part of the oxygen for the oxidation of the hydrogen and carbon of the organic substances in the blue mud is derived from the sulphur salts of the alkaline and earthy alkaline metals in sea water, which, in the first instance, are reduced to the form of sulphides. These sulphides, owing to their instability, especially in the presence of free or loosely combined carbonic acid, are decomposed as they are formed. The sulphur thus reduced from the sulphates may in part, on passing as hyposulphuric acid into the water immediately above the mud, become oxidized back again into sulphuric acid, which, in turn, decomposing the carbonate of lime always present, would reform the sulphate. A certain part of the sulphides or of hydrosulphuric acid which is formed reduces the ferric oxide of the deposit, forming sulphide of iron, which so long as it is not exposed to the action of oxygen remains stable. This gives the characteristic blue color to the great majority of blue muds; and it is by this process that sulphur is continually abstracted from sea water and locked up in marine deposits, which may finally be converted into blue-colored shales, schists, and marls. In these rocks the crystalline pyrites has evidently its origin in the processes of death and decay going on at the time of their deposition at the sea bottom, the sulphur of the sulphide of iron being derived from the sulphates of the sea water, and not from the sulphur of the organisms, as is generally supposed. The bisulphide of iron in the coal measures has probably a similar origin. In the red muds and clays, either from the abundance of oxygen in the superincumbent waters, from the ochereous matter present in the mud or clay, or from the organic matter being small in quantity, the sulphide of iron is either not formed or is after formation soon oxidized into ferric hydrate, which then gives its characteristic red color to the deposits. It may be accepted as a rule that muds containing a large amount of organic matter relatively to the iron present invariably partake of the characteristic blue-black color, while if organic matter be low in amount, or absent, the black sulphide is either not formed or is oxidized into peroxide of iron.

The ammonium salt of thio-acetic acid, $\text{CH}_3\text{COSNH}_4$, is described by Prof. Schiff and Dr. Tarugi as an excellent substitute for the disagreeable sulphureted hydrogen in qualitative analysis. Ammonium thio-acetate is decomposed by hot dilute hydrochloric acid, liberating sulphureted hydrogen without any precipitation of sulphur. No objectionable by-products are formed in the reaction, only sal-ammoniac and acetic acid being produced. When a feebly ammoniacal solution of ammonium thio-acetate is added to a hydrochloric-acid solution of metals of the second group and the liquid is heated to near boiling, the metals are at once precipitated as sulphides, while only the faintest odor of sulphureted hydrogen is perceptible. After cooling and filtering the filtrate is found to contain no trace of the metals. The completeness and rapidity of the reaction, particularly in the case of arsenic, is one of its strongest recommendations. Thio-acetic acid is readily prepared by

acting upon glacial acetic acid with phosphorus pentasulphide. It boils at 95°C , and is but slightly soluble in water. When the acid is dissolved in a slight excess of dilute ammonia a yellow solution is obtained, which is then diluted to 3 times the volume of the acid originally taken—that is, 10 cubic centimetres of the acid furnish 30 cubic centimetres of the reagent. It is proper to observe that zinc, manganese, nickel, and cobalt are not precipitated in the presence of hydrochloric acid by the new reagent any more than they are by sulphureted hydrogen. The sulphides of these metals are at once precipitated, however, upon rendering the solution alkaline; but as ammonium sulphide acts quite as well for this purpose, Prof. Schiff confines the use of ammonium thio-acetate to the precipitation of the metals of the second group.

Until lately no satisfactory experimental criterion was known for distinguishing easily between true compounds and homogeneous mixtures, but the recent work of Raoult, according to Mr. Philip Hartog, showed that the freezing point of a pure compound was always lowered and its boiling point raised by any admixture.

The method of Dr. J. B. Cohen for determining carbonic acid in the air depends on the length of time required by the carbonic acid in a given volume of air to neutralize a known amount of standard lime solution insufficient to combine with all the carbonic acid present.

Cotton and wool may be separated from one another, according to Thomas T. P. B. Warren, by operating on two samples of the textile material, using a solution of caustic soda in one case and dilute sulphuric acid in the other case. On boiling, the wool will be removed in the first case, while the cotton will be left. In the second case the cotton will be removed while the wool will be left. The fibers are then in a condition fit for further examination if required. If a sample be heated for some time to 250°F , the wool can be rubbed out as dust, while the cotton will only be rendered slightly tender. Of course in this case the character of the wool as regards staple, etc., will be lost. If a sample be dipped into dilute sulphuric acid and hung up for some time in a warm place the cotton will be destroyed. On washing and drying the weight of wool is obtained. The loss is due to cotton, size, starch, mineral matter, etc. Undyed mixtures may be boiled in a weak solution, say of eosin. Wool takes a faint pink color; the cotton is unaltered. Dyed mixtures may in most cases be recognized by the action of dilute acids, especially if dyed in the piece, and in many cases if dyed in the hand.

Chemical Synthesis.—The synthesis of natural products, or of compounds which are known to be produced by the vital processes of animals and plants, was named by Prof. Raphael Meldola in his address at the British Association as the greatest of the triumphs of structural chemistry. According to a census made by the author, about 180 such syntheses have been realized. The products of bacteria are included within the list because they are results of vital activity in the same sense that alcohol is a product of the vital activity of the yeast plant; while the uro-compounds resulting from the transformation in the animal economy of definite chemical

substances administered for experimental purposes are excluded because natural products only are contemplated. The artificial formation of natural products began with observations arising from experiments not primarily directed to that end. It was not till the theory of chemical structure had risen to the rank of a scientific guide that the more complicated syntheses were rendered possible by more exact methods. An understanding is needed as to what is meant by an organic synthesis. There appears to be an impression among many chemists that a synthesis is effected only when a compound is built up from simple molecules. If the simpler molecules can be formed directly from their elements, then the synthesis is supposed to be complete; but the great interest of all synthetic work arises from our being able by laboratory processes to obtain compounds which are also manufactured in Nature's laboratory—the living organism. Now, if we confine the notion of synthesis to the building up of molecules from simpler molecules or from atoms, we exclude one of Nature's methods of producing many of those very compounds which we claim to have synthesized. There can be no doubt that a large proportion, if not a majority, of the natural products which have been prepared artificially are not synthesized by the plant in the sense of building up at all. They are the results of the breaking down—of the degradation—of complex molecules into simpler ones. The author urges therefore that if in the laboratory we arrive at one of these products by decomposing a more complex molecule by means of suitable reagents, we have a right to call that a synthesis, provided that the more complex molecule which gives us our compound can be in its turn synthesized by no matter how many steps from its constituent atoms. What evidence is there that any one of the 180 compounds which have been prepared artificially is produced in the organism by a direct building up? Is not the opposite view quite as probable? May they not from the simplest to the most complex be products of the degradation of still more complex molecules? It must be remembered that a compound or mixture of a highly complex proteid nature—protoplasm—is always present in the living organism and is the essence of the vitality. Supposing that the products in question are formed by chemical actions upon this, there is no such process as the direct combination of dead molecules to build up a complex substance, but everything must pass through the vital mill. The supposition that chemical synthesis in the organism is the result of the combination of highly complex molecules with simpler molecules, and that the unstable compounds thus formed then undergo decomposition with the formation of new products, may be provisionally called the protoplasmic theory of vital synthesis.

In the attempt of Dr. Backhouse to produce artificial human milk, milk carefully collected with due attention to cleanliness is submitted to fermentation by rennet, in the course of which a relatively rich milk serum is produced containing albumin and milk sugar. This serum is sterilized, and cream is added. A material is thus produced which closely resembles

human milk, and can be varied in composition according to the age of the person using it, or according to what he needs. The author suggests that the sterilization of milk should, if possible, be carried out on the large scale in dairies before distribution; and that in this way, better apparatus being to hand, more cleanly and more effectual results will be obtained than when the sterilization is left in the hands of private persons. Dr. P. Frankland claims to have prepared an artificial human milk by a similar but slightly different process—adding milk sugar to make up the deficiency in the cow's milk—in 1854, and that his recipe has been advantageously used in private and hospital practice.

The synthesis of caffeine has been effected by Emil Fischer and Lorenz Ach, of Berlin. The substance is obtained by a series of processes from the product of the condensation of dimethyl urea and malonic acid.

A new series of iron nitroso compounds described by K. A. Hoffmann and O. F. Wiede affords fine examples of the synthetical production of complex inorganic substances. The compound $\text{Fe}(\text{NO})_2\text{S}_2\text{O}_3\cdot\text{KH}_2\text{O}$ is precipitated in red-brown leaflets by the action of nitric oxide with ferrous sulphate and potassium thiosulphate. This substance is with difficulty soluble in water, and gives a greenish-yellow solution, without decomposition, when dissolved in concentrated sulphuric acid. Ammonium and sodium compounds of similar composition and properties have been prepared. These compounds are classed as salts of dinitrosoferrothio-sulphuric acid. Cobalt compounds can be obtained, in which cobalt replaces the iron, but with greater difficulty.

A compound of aluminum chloride with benzoyl chloride has been obtained in large crystals by M. Perrier. Such compounds are of particular importance, in view of the remarkable part which aluminum chloride has been found to play in synthetical chemistry, as affording some insight into the nature of the intermediate reactions upon which the apparently catalytic action of this salt depends. The crystals decompose rapidly in moist air, and are instantly decomposed by water, forming an aqueous solution of aluminum chloride, hydrochloric acid, and benzoic acid. They are readily soluble, however, without decomposition, in carbon bisulphide. The formation of compounds of this nature appears to be general throughout the aromatic series. Compounds containing the aromatic ketones, ethers, and phenols, the chloride of phthalic acid, and the chloride of butyric acid have also been obtained.

Agricultural Chemistry.—From investigations of the chemical history of the barley plant carried on during 1894 and 1895 on the experimental plots at Woburn, C. F. Cross and C. Smith draw the general conclusions that the conditions of soil and nutrition have very little influence on the composition of the plant; that the straw grown in wet seasons has a high feeding value, and conversely a low paper-making value; and that the compositions known as furfuroids are continuously assimilated to permanent tissue in a normal season, but in a very dry season the permanent tissue is drawn upon

by the growing plant for nutrient material, which is ordinarily drawn from the cell contents.

The question of nitrogen fixation in algae has been investigated by Prof. Frank, of Berlin, Laurent and Schloesing, and Koch and Korsowitsch, and most recently by Korsowitsch in 1894. The last author directed his experiments to determining whether algae in themselves possess the power of assimilating free atmospheric nitrogen or not. Having succeeded in obtaining a single species of alga in a state of purity—a *cystococcus*—he placed it in a nutritive solution free from nitrates. It failed to show any signs of growth. On adding nitrates to the sand, it grew rapidly till the added nitrates were exhausted, and then stopped; the addition of more nitrate-free solution gave no result, but if only the merest trace of a nitrate were added activity of growth immediately ensued. The conclusion from this experiment—that *cystococcus* is unable to fix free nitrogen—was confirmed by chemical analysis. The experiments were next varied, with different kinds of alga placed in nutritive cultures containing soil bacteria of different kinds, arranged in pairs, both members of each couple having identical conditions, except that in the one a small quantity of sugar (dextrose) was added, while in the other no organic compound was present. The results were various, some of the algae fixing nitrogen in the cultures whether with or without sugar and some only in the cultures containing sugar, while, generally, the activity was largely increased in the sugar-containing cultures. From all the experiments the conclusions are drawn that at least two algae—*cystococcus* and *stichococcus*—possess no "fixing" powers in themselves; that many algae, taken together with certain micro-organisms of the soil, do possess the power of assimilating organic nitrogen; and that this power is much increased by the addition of such organic substances as sugar. The experiments of Laurent and Schloesing had showed that if in a culture of algae and bacteria, endowed with "fixing" powers, the algae were destroyed, the bacteria lost some, if not all, of this capacity which the mixture had possessed; and the experiments of Berthelot, Gautier, and Drouin had shown the importance of organic compounds to nitrification. From such observations as these Korsowitsch concludes that the relationship which the algae bear to the micro-organisms is one connected with the organic food supply of these latter; and that the algae, furnished with nitrogen by the bacteria, assimilate carbohydrate material, part of which goes to their own maintenance, but part also to that of the micro-organisms. The relation is therefore, in his belief, an instance of symbiosis, in which each supplies the wants of the other.

The conclusions drawn by M. Pagnoul from his researches on assimilable nitrogen and its transformations in arable land are: 1, that abundant rains may carry off from rich soils considerable amounts of nitric nitrogen; 2, that plants growing on the soil are able to prevent this loss; 3, that carbon disulphide arrests the action of the nitric ferment temporarily without killing it; 4, that the ammoniacal form is a transition state for organic nitrogen passing into

the nitric form; carbon disulphide causes the temporary suspension of action at this stage; and 5, that the nitrous form is also an unstable transition stage.

M. Berthelot's experiments prove that microbes exist of very different species, free from chlorophyll, and capable of fixing nitrogen, especially certain bacteria of the soil. The nutrition of these plants does not appear capable of being maintained by the carbon and hydrogen, resulting from the decomposition of the atmospheric carbonic anhydride and water. It is correlative with the destruction of certain hydrocarbons, such as sugar or tartaric acid, which in some way act as food for micro-organisms. For these beings to fix nitrogen it is necessary that they find suitable nutriment in the medium where they live. It even appears essential for these substances to contain some little nitrogenous matter in order to give the lower organisms the minimum of vitality necessary for the absorption of free nitrogen. But if these nitrogenous principles are too abundant, the bacterium subsists by preference at their expense.

The drainage of cultivated soils, M. P. P. Dehérain observes, is much less abundant than that of bare soils, and is less the longer the ground is occupied. In agriculture the object to be aimed at is to cover the soil with a plant sufficiently luxuriant in its vegetation to evaporate all the rainfall. The loss of nitrogen compounds is regulated, not by the composition of the drainage, but by its abundance. All the nitrogen nitrified in the soil is either assimilated or lost. Thus, when the crop is small the farmer is doubly injured—by the deficiency of the products obtained and by the impoverishment of his land.

B. Dyer has made a series of determinations of the average acidity of the root sap of about 100 plants in order to measure the power possessed by plants of dissolving the mineral constituents of soils. The experiments seemed to indicate the suitability of a 1-per-cent. solution of citric acid as an analytical soil solvent. The effect of this solution on a number of the Rothamstead soils was therefore tried. The conclusion is drawn that valuable indications of the comparative fertility of the soil in minerals are obtained by the use of such a solution.

Miscellaneous.—Messrs. Jolles and Winkler find from their investigation of the bacterial contents of margarine and margarine products that these substances are considerably freer from microbes than ordinary butter not made with Pasteurized cream. Whereas butter contains an average of from 10,000,000 to 20,000,000 microbes per gramme, margarine butter yields only from 4,000,000 to 6,000,000 microbes; and in extreme cases the proportion is as 47,000,000 to 11,000,000. Cold appears to act more prejudicially on margarine microbes than on butter germs. No pathogenic bacteria were discovered in any of the samples examined. Many of the ordinary microbes found were isolated and described, and among them two were found which the authors believe are closely associated with rancid processes that occur in old samples of margarine.

Arsenic occurs as an impurity in much glycerin, and samples even of that substance designed

for pharmaceutical purposes have been found to contain it. This arsenic is derived from the reagents used in preparing the glycerin. The supposition, largely entertained, that the arsenic can be, and is removed by distillation is declared incorrect by J. Ławkowitch, a manufacturer, who says that arsenic contained in glycerin can not be removed by distillation, and that there is no process known to him for completely freeing glycerin from arsenic. The pure substance, free from arsenic, can therefore be obtained only from sources where reagents not contaminated with arsenic are used. It can be obtained in those processes where the fats are hydrolyzed by means of water, or in which lime saponification is employed. But all glycerin coming from works where sulphuric-acid saponification is used will contain arsenic, as the glycerin will extract all the arsenic from the sulphuric acid. Arsenic, though the most objectionable one, is not the only impurity that may be found in "chemically pure" glycerin. Organic impurities may be present, either fatty acids, etc., or what are called polyglycerols, under which are summarized all those substances having a higher boiling point than glycerin. Suitable tests are prescribed for the detection of these substances.

Experiments made by R. T. Thomson for comparing the value of formic aldehyde as a preservative with such substances as boric acid, salicylic acid, and benzoic acid show that 8½ grains of the 40-per-cent. solution of formalin (the best commercial form of the substance) are quite as effective in preserving milk as four times that amount of boric acid (at least when used as a mixture of boric acid and borax), and the same proportion of salicylic acid, while the preserving power of benzoic acid is very low compared with what might be expected from statements made in text-books.

Discussing the sensitizing action of dyes on gelatino-bromine plates, C. H. Bothamly offers evidence against Abney's view, that an oxidation product, formed by the action of light on the dye, is the active agent in assisting the reduction of the silver bromide by the developer. The probabilities, the author held, appear more in favor of Eder's view, that the dye or sensitizer absorbs the energy of the light waves, and passes that energy on to the silver bromide with which it is associated, the silver bromide being thereby decomposed, and the so-called latent image being formed. The author added that so far as he was aware, photo-chemical action is always preceded by the absorption of light waves, and, in the case of colorless substances, it is the ultra-violet rays that are absorbed and do the chemical work. Although the quantitative composition of the latent image is not known, we have, as a matter of fact, considerable knowledge as to its properties. There is no difficulty in determining the absorbing action and the sensitizing effect on two contiguous strips of the same plate, and therefore under strictly comparable conditions. No relation can be traced between the fluorescence of a dye and its sensitizing action.

Mr. Th. Schloesing has experimented with a number of substances with a view of finding a paste for tipping matches endowed with the properties of the mixture containing white phos-

phorus and not having its poisonous properties. The results showed that it is necessary to use potassium chlorate, red phosphorus, ground glass, glue, or its equivalent, and that it is not a simple matter to find a perfect substitute for the paste used in tipping common matches.

In experiments on the antiseptic properties of disinfectants mixed with different fats in the shape of ointments, Dr. Breslauer examined carbolic acid, corrosive sublimate, boric acid, nitrate of silver, etc., in combination with oil, vaseline, fat, lanolin anhydricum, lanolin, and unguentum leniens. The degree of antiseptic power possessed by the disinfectant was found to depend in a remarkable manner upon the particular diluent employed; and in all cases the best antiseptic results were obtained with disinfectants in combination with lanolin or unguentum leniens. The author asserts that oil and fats simply reduce the antiseptic action of the disinfectant.

Prof. Clowes has found that an atmosphere containing 16.4 per cent. of oxygen, 80.5 per cent. of nitrogen, and 3.1 per cent. of carbon dioxide will extinguish a candle flame; while it is still, according to Haldane, respirable, and can even be breathed for a considerable time by a healthy person without injury. An atmosphere which extinguishes a coal-gas flame, however, appears, so far as the proportion of oxygen which it contains is concerned, to approach the limits of respirability. The author advises that the coal-gas flame be substituted for the candle and lamp flame as a test for the quality of air.

CHILI, a republic in South America. The national Congress consists of two branches, the Senate and the Chamber of Deputies. Senators, of whom there are one third as many as there are Deputies, are elected by the provinces for six years; Deputies are elected by the departments for three years. Every male citizen twenty-one years of age has a vote if he can read and write. The President is elected by indirect suffrage for five years. The Cabinet is selected by the President, but the ministers are now considered responsible to Congress.

Jorge Montt is President for the term ending Dec. 26, 1896. The Cabinet in the beginning of 1895 was composed of the following ministers: Interior, Dr. McIver; Foreign Affairs and Worship, Mariano Sanchez Fontecilla; Justice and Public Instruction, Federico Errazuriz; War and Marine, Santiago Aldunate Baseoñan; Finance, Carlos Riesco; Industry and Public Works, Manuel A. Prieto.

Area and Population.—The area of the republic is 293,970 square miles. The population on Dec. 31, 1893, was estimated at 2,915,332 on the basis of the census of 1885. A corrected official estimate makes it 3,365,221, including 50,000 uncivilized Indians. The population of Santiago, the capital, is about 250,000; that of Valparaiso, the chief port, is 150,000.

Commerce.—The value of the imports in 1893 was 68,235,874 silver pesos (1 peso = 91 cents); of the exports, 72,245,114 pesos. More than half the total value of exports represents nitrate. The chief imports are sugar, cattle, coal, and cloths. The values of the leading exports in 1892 were: Nitrate, 31,785,060 pesos; wheat, 6,196,457 pesos; iodine, 5,138,460 pesos; bar

copper, 5,076,922 pesos; silver bars, 5,017,300 pesos; leather, 814,328 pesos; gold bars, 683,638 pesos; manganese ore, 516,851 pesos; barley, 458,971 pesos; wool, 434,496 pesos; silver ore, 418,077 pesos; wheat flour, 273,171 pesos; beans, 177,567 pesos.

The trade with the principal countries is shown in the following table for 1890, giving the values of the imports from and exports to them in silver pesos:

COUNTRIES.	Imports.	Exports.
Great Britain	59,479,000	44,080,007
Germany	15,660,000	6,354,479
United States	8,917,000	6,240,975
France	6,842,000	2,394,425
Peru	2,394,000	2,164,725

Navigation.—There were entered in 1892 at Chilean ports 8,869 vessels of all kinds, of 9,001,269 tons, and cleared 8,371, of 8,923,222 tons. The tonnage entered of vessels in foreign commerce was 2,245,572, of which 40 per cent. was Chilean, and 30 per cent. English.

The merchant marine on Jan. 1, 1894, consisted of 137 vessels, of 102,199 tons. Of these, 39, of 40,741 tons were steam vessels.

Communications.—The length of railroads in 1892 was 1,735 miles, of which the Government owned 686 miles.

The Government in the beginning of 1894 had 6,965 miles of telegraphs, with 8,330 miles of wire. During 1893 there were 894,280 messages telegraphed. The railroads and companies had 4,300 miles of wire.

The postal traffic for 1892 was: Letters, 23,458,507; postal cards, circulars, etc., 1,740,771; newspapers and printed matter, 24,706,325. The receipts were \$851,893 and expenses \$842,194.

The Army.—The regular army consists of 7 regiments of infantry, 4 of cavalry, 3 of artillery, and the corps of engineers. The law of Feb. 2, 1892, restricts the number to 6,000 men. There are 526 regular army officers. The National Guard in 1894 consisted of 42,120 infantry and 8,970 artillery.

The Government has purchased a large number of Krupp cannon. The tactics, discipline, and equipment of the army have been improved under the direction of Gen. Körner, who in 1895 engaged the services of 26 other German officers.

The Navy.—The Chilean navy in the beginning of 1895 consisted of 1 battle ship, 1 armored coast guard, 1 armored cruiser, 4 second-class cruisers, 10 small cruisers and gunboats, and 11 torpedo boats. The "Capitan Prat," of 6,900 tons displacement, has a speed of 18½ knots, and besides side armor has strong barbettes in which are mounted 9½-inch Canet guns in the bow, the stern, and on either side, and 4 turrets in which are 8 4½-inch quick-firing guns. The cruiser "Almirante Cochrane," of 3,500 tons, has 9-inch plates and carries 6 18-ton and 4 quick-firing guns. The deck-protected cruiser "Esmeralda," of 3,000 tons, carries 2 24-ton and 6 4-ton guns, and can steam 18 knots. The cruisers "Presidente Errazuriz" and "Presidente Pinto," of 2,080 tons, have a speed of 19 knots. This is surpassed by the new "Blanco Encalada," of 4,500 tons, launched at Elswick in September, 1893, which makes nearly 22 knots an hour with natural draught.

Finances.—The revenue for 1895 was estimated at 70,502,288 pesos in currency and £1,647,302 in gold (the paper peso was worth no more than 25 cents). The expenditures were estimated at 57,091,233 pesos in currency and £779,807 sterling. The annual interest on the debt payable abroad is \$605,000. The capital of the external debt was £11,626,300 in May, 1895. The internal debt amounted to 6,597,114 pesos. A new foreign loan of £2,000,000 was authorized in May, 1895, guaranteed on the revenue from the nitrate deposits.

Resumption of Specie Payments.—A bill passed by Congress in 1892 provided for the redemption from Jan. 1, 1896, of 46,450,000 pesos of state and guaranteed bank notes at the rate of 24d. per peso. A conversion fund was amassed, amounting on July 1, 1894, to 10,855,000 pesos. It was intended to resume specie payments on July 1, 1896, paper currency to cease to be legal tender from Jan. 1, 1897. The paper peso in 1894 was worth on the average 1s. 4d. in exchange. Very little gold has been coined, and none has remained in circulation. Another law of 1892 provided for a system of currency based on gold, which should come into use on July 1, 1895. Silver would not be legal tender for more than 20 pesos. The gold peso was to be the unit of value, the doblon or 8-peso piece having the same weight and fineness as the English sovereign. In 1895 some of the details of the plan of conversion were changed. It was decided to redeem the paper notes at the rate of 18d. per peso on and after June 1, 1895. The Government was empowered to coin silver in the space of three years to the amount of 10,000,000 pesos or dollars, 0.835 fine and weighing 20 grammes. The silver coins were made legal tender to the limit of \$50, but the Government treasury was obliged to receive them in any amount for taxes or other obligations, and also to redeem them in gold when presented at the mint. The new act, which passed both houses in May, provided for a system of bank currency guaranteed by the Government. Gold and silver coins and credits in Europe were provided for the resumption of specie payments on the day fixed. The proceeds of the new loan were applied to this operation, for which the public finances and foreign exchange were favorable, exports for the year having exceeded imports by 37,000,000 pesos and the revenue showing a surplus of 10,000,000 pesos or over. There was no great demand for the new gold, and exchange remained steady, but the gold began gradually to flow over to Europe.

Cabinet Crisis.—A reconstruction of the Cabinet occurred in April. Señor Prieto took the portfolio of Finance, Señor Errazuriz became Minister of War, and Señor Valdez y Valdez entered the Cabinet as Minister of Public Works. The Cabinet thus constituted was partly Liberal and partly Radical. The party of Balmaceda and the Liberals were disposed to enter into an electoral alliance for the coming presidential campaign. A Cabinet crisis resulted in July from the appointment by President Montt of diplomatic representatives abroad that were displeasing to the majority of the Senate. Señor Melver, one of the Radical leaders, declined to form a new Cabinet. Ismail Vergara, Presi-

dent of the House of Deputies, after making one attempt, would not undertake the task a second time. The crisis lasted nearly a month, while the conditions were being arranged for a fusion of the Liberal parties. One of the Radical chiefs, Señor Recabarren, then undertook to organize a ministry, which was completed on Aug. 1 as follows: Minister of the Interior, Dr. Recabarren; Minister of Foreign Affairs, Dr. Matte; Minister of Finance, Dr. McIver; Minister of War and Marine, Valdez y Valdez; Minister of Justice, Sanchez Fontecilla; Minister of Public Works, Davila Baeza. The new Government made the same promises that the ministry had that was overthrown, including pledges of noninterference in elections, conversion of the public debt, and the fulfillment of all treaty obligations. It was proposed to raise a loan of 20,000,000 pesos for national defenses and the development of the annexed provinces. A railroad is to be built to Tarapaca, and a harbor made at Constitucion, and Talcahuano, where the Government has constructed a great dry dock, is to be strongly fortified.

Foreign Relations.—A joint commission appointed to delimit the Argentine frontier came together in the summer of 1895, but made no progress in the actual work of delimitation.

The claims of British subjects for damages arising out of the civil war of 1891 were submitted, under the terms of a convention concluded on Sept. 28, 1893, to a mixed commission, which met on Oct. 24, 1894. Claimants had to present their memorials within six months from that date.

CHINA, an empire in eastern Asia. The Government is an absolute monarchy regulated by historical precedents and the Confucian principles of morality. The Manchu or Tsing dynasty has reigned since 1644. The Emperor chooses his heir from among the sons of his first three wives. The present Emperor, who reigns under the style of Kwangsu, which means continuation of splendor, was proclaimed irregularly, his uncle and predecessor having died a minor without leaving a legal successor. He was born Aug. 2, 1872, being the son of Prince Chun, the seventh son of the Emperor Tarkwang, and came to the throne after the death of the Emperor Tsaichun, Jan. 12, 1875, under the direction of his aunt and adoptive mother, the Empress Dowager Tsu-Hsi, mother of the late Emperor, who retained her title of co-Regent, becoming sole Regent upon the death of the Eastern Empress in 1881, and continued to direct the affairs of the empire until the young Emperor became of age and married, and on March 4, 1889, assumed the Government. Ever since then the Empress Dowager has had the final voice in important decisions.

The offices in the Imperial Government and in the administration of the provinces are conferred upon mandarins who show in examinations excellent scholarship and literary style formed on the models of the classical writers of history, poetry, and political and ethical philosophy. Only the *literati*, men who have passed the literary examinations, of which there are many grades, are eligible to civil office; but appointments and promotions depend not merely on literary proficiency, but upon personal fitness and proved administrative ability, often too, it

is said, upon favoritism. There is a Tsung-Tu, or Governor-General, over the capital province of Pechili and over the Liang-Kiang, Min-Che, Liang-Hu, Chan-Kan, Liang-Kwang, and Yun-Kwe groups of provinces and over Szechuen, while each province has its Sun-Fu, or Governor. These officers and the local officials are almost independent of the Imperial Government, which has little to do with the people in general, but they are held accountable by the central authorities for their manner of administration, and may be removed at any time and degraded in official rank or punished even with decapitation for wrongdoing, while on the other hand a virtuous and successful administration brings rewards.

Finances.—The revenue of the Imperial Government is derived from a land tax yielding about 20,000,000 haikwan taels a year, the rice tribute worth, on the average, 2,800,000 taels, the salt levy estimated at 9,600,000 taels, the native custom yielding 6,000,000 taels, a transit levy on opium and other goods that gives about 11,000,000 taels, licenses producing 2,000,000 taels, and the maritime customs under foreign supervision, to which an additional tax on opium has been added which importers have the option of paying in lieu of *likin* or transit duties. The total revenue is supposed to be from 75,000,000 to 78,000,000 taels a year. The customhouse returns are the only ones that are officially published. The receipts from maritime customs in 1893 amounted to 21,989,300 haikwan taels, including 5,362,733 taels from the commuted *likin* tax on opium. In emergencies the Government has compelled wealthy officials and others to contribute money for the relief of its necessities. The sale of brevet titles is another occasional source of revenue.

The first foreign loans, amounting to over £2,225,000 sterling, were contracted at 8 per cent. in 1874 and 1876 and secured by the customs. In 1884 and 1886 silver loans amounting to £3,755,000 were obtained, and in 1887 a loan of £250,000 was raised in Germany. Early in 1895 a war loan of £3,000,000 was obtained.

Commerce.—The imports for 1893 were officially valued at 151,362,819 haikwan taels (the exchange value of the tael was nearly \$1), including 1,964,000 taels of re-exports, and the exports at 116,632,311 taels. Allowance being made for costs incurred after landing and for expenses of shipping to be added, the value of the imports was about 129,250,000 and of the exports 131,950,000 taels. This does not include a considerable trade that is carried on in Chinese junks not subject to the control of the maritime customs. The direct trade with various countries was as follows:

COUNTRIES.	Imports.	Exports.
Hong-Kong	80,891,000	48,290,000
Great Britain	28,156,000	11,608,000
East India	16,740,000	2,735,000
Continent of Europe	5,216,000	15,853,000
United States	5,444,000	11,726,000
Japan	7,552,000	9,898,000
Siberia	180,000	6,844,000
Russia in Europe	704,000	3,038,000
Straits Settlements	2,448,000	1,792,000
Macao	2,864,000	2,046,000
Other countries	2,832,000	3,798,000
Total	153,327,000	116,632,000

The following were the values of the principal imports in 1893: Opium, 31,691,399 taels; cotton cloth, 27,275,000 taels; cotton yarns, 17,962,000 taels; rice, 12,963,000 taels; sugar, 7,429,000 taels; kerosene, 5,571,193 taels; woolen manufactures, 4,587,006 taels; fish, 3,111,000 taels; iron, 2,475,000 taels; timber, 2,214,000 taels; coal, 2,000,000 taels; tin, 1,944,000 taels; matches, 1,540,000 taels. The principal exports and their values were as follow: Tea, 50,338,733 taels; raw silk, 29,020,000 taels; silk goods, 7,847,000 taels; cotton, 6,166,000 taels; beans, 2,522,000 taels; straw braid, 2,429,000 taels; sugar, 2,319,000 taels; paper, 1,830,000 taels; matting, 1,829,000 taels; clothing and shoes, 1,757,000 taels; wool, 1,324,000 taels; skins, 1,290,000 taels; tobacco, 1,304,000 taels; pottery, 1,178,000 taels.

The total export of tea in 1893 was 1,820,831 piculs (1 picul = 133½ pounds), of which 367,218 piculs were shipped to England, 683,744 to Russia, 342,287 to the United States, 160,979 to Hong-Kong, and 89,668 to Australia.

Navigation.—During 1893 there were 37,902 vessels, of 29,318,811 tons, entered and cleared at Chinese ports, of which 19,303, of 19,303,979 tons, were British; 14,270, of 6,829,950 tons, Chinese; 2,142, of 1,508,015 tons, German; 623, of 599,579 tons, Japanese; 167, of 259,687 tons, French; and 63, of 78,175 tons, American. Of the total number, 29,761, of 28,277,050 tons, were steamers.

Communications.—The only railroads yet built are the line from the Kaiping coal mines to the Peking river, and a coal road on the island of Formosa.

Telegraphs now connect all the principal cities and the military posts on the frontiers with the capital. The telegraph system joins the British line at Port Arthur and the Russian transcontinental telegraph at its terminus in the Amur district. In accordance with a convention signed at Tientsin on Sept. 6, 1894, a junction has been made also with the lines of Burmah and British India.

The Army.—The Chinese military forces consist of the Tartar army of Eight Banners, employed to guard the capital province and garrison the chief cities, and the Ying-Ping or national army. The Manchus or soldiers of the Eight Banners enjoy various privileges. They number about 288,000 men, of whom not more than 90,000, including the Peking guard of 13,000, are instructed in modern warfare and provided with European weapons. The men forming the other forces are poorly paid and fed. They are recruited from the lowest classes, for the military profession is generally despised by the Chinese. Each province has its independent military organization, of which there are 23, under the direction of the Governors, to whom, however, the Tartar generals are not subordinate. None of the formations are kept up to their nominal strength, and in many cases they are mere skeleton organizations. Officers have been known to pocket the pay of regiments that do not exist, but which can be improvised by hiring coolies when the inspecting officers make their rounds. Most of the troops sent to the seat of war to fight the Japanese were raw levies recruited from the dregs of the population and

often pressed into the service. They had not learned to handle their weapons, which were often defective, and, as their pay was usually in arrears and their food supply irregular, they had no heart to fight. Often they killed their own officers and ran away before the enemy came in sight. The national troops or army of the Green Flag have been estimated at 539,000 men. The Mongolian militia numbers 117,000, the Tibetan militia 64,000.

The Navy.—The Pei-Yang or northern squadron, the only efficient naval force, was almost entirely destroyed or captured during the war with Japan. The Foochow squadron consists of 4 unprotected steel cruisers of 2,500 tons or under, 3 gunboats, 4 armed transports, and 2 torpedo boats. The "Chao-Yung," a protected schooner belonging to this squadron, was added to the Pei-Yang squadron, and was rammed and sunk by her consort, the "Tai-Yuen" while endeavoring to escape from the battle of Hai-Yun-Tao or the Yalu on Sept. 17, 1894. Another cruiser that joined the northern fleet, the "Yang-Wei," was run ashore to avoid sinking during the same engagement. The Canton flotilla consists of 17 gunboats and 30 torpedo boats. The Shanghai flotilla has 1 armored frigate, 1 gunboat, 6 floating batteries, and 3 transports. The three best ships of this squadron were the "Kwang-Yi," the "Kwang-Chia," and the "Kwang-Ping," which were attached to the northern squadron at the beginning of the war. Of these, the "Kwang-Yi" was so battered at the battle of Amn that she was beached and was afterward destroyed by the Japanese; the "Kwang-Chia" was run ashore in attempting to escape from the battle of the Yalu, and was blown up by the Japanese; and the "Kwang-Ping" was surrendered at Wei-Hai-Wei. The vessels of the Pei-Yang squadron that were lost in action during the war were: The "Tian-Cheng," dispatch vessel, taken off Amn, July 25, 1894; "King-Yuen," belted barbette cruiser, sunk at the battle of the Yalu; a torpedo boat taken at the fall of Port Arthur; "Ting-Yuen," armor-clad battleship, torpedoed at Wei-Hai-Wei, Feb. 4, 1895; "Lai-Yuen," belted barbette cruiser, torpedoed at Wei-Hai-Wei, Feb. 3, 1895; "Wei-Yuen," training ship, sunk at Wei-Hai-Wei, Feb. 5, 1895; 5 torpedo boats destroyed and 8 captured after an unsuccessful attack on the blockading squadron at Wei-Hai-Wei, Feb. 7, 1895; "Ching-Yuen," protected cruiser, sunk at Wei-Hai-Wei, Feb. 9, 1895. The following vessels were surrendered at the capitulation of Wei-Hai-Wei, Feb. 16, 1895: "Chen-Yuen," armor-clad battle ship; "Tai-Yuen," armored ram turret ship; "Ping-Yuen," ironclad coast-guard; "Chen-Pien," "Chen-Pei," "Chen-Chung," "Chen-Nan," "Chen-Tung," and "Chen-Hai," gunboats.

The Japanese in Manchuria.—The army of Marshal Yamagata, commanded after Yamagata's return to Japan by Lieut.-Gen. Nodzu, after crossing the Yalu in October, 1894, separated into two equal divisions, each 12,500 strong. The right wing moved northward along the Mukden road as far as the Fen-Shai-Ling pass. The left wing marched westward with the object of establishing communications with the second army, 22,000 strong, that had been sent by sea

under Marshal Oyama to take Port Arthur and advance up the Liao-Tung peninsula and onward, when it joined the other army, to Peking. Though the movement toward Mukden was of the nature of a feint, intended merely to hold the Chinese in check and prevent their co-operating with the forces in the south, the Chinese massed 25,000 troops in front of Mukden to defend the passes leading to the sacred city and sent down Gen. I with the army that guarded the Amur frontier to break through the Japanese line of communications, in the expectation that these would extend from the Yalu river to Mukden. Maj.-Gen. Tatsumi, who commanded the van of the right wing, broke and dispersed I's forces and intrenched himself at Tsao-Ho-Ken. The left wing of Gen. Nodzu's army, commanded by Lieut.-Gen. Katsura, advanced to Siu-Yen, driving the Chinese troops of Gen. Seh and Gen. Tang out of that place, as they had previously out of Antung and Taku-Shan. In December the march was continued in the direction of Hai-Tcheng, whither the Chinese had retreated. That place was occupied on Dec. 13, 1894, by Maj.-Gen. Oseko's column after he had defeated the Chinese at Simu-Tcheng. Extending his line southward to Kao-Khan, he established communications with the advanced guard of Marshal Oyama's army, which occupied Foochow on Dec. 5, and captured Kaiphing on Jan. 10, 1895. The united Japanese armies were in face of a force of about 60,000 Chinese, consisting partly of the troops that had been fighting Gen. Nodzu's army and retreating all the way from the Yalu river, partly of Gen. Sung's army that had fallen back before Marshal Oyama, partly of the garrison of Niuchuang, and partly of a Mongolian detachment that had recently arrived. These forces were posted to guard Niuchuang and its port and the roads leading into China proper.

The Japanese troops that occupied Foochow under the command of Gen. Nogi, were transported by sea from Port Arthur. Kaiphing was taken after a severe fight with Gen. Seh's garrison of 6,000 men, who were attacked on both flanks. The Japanese losses were 46 killed and 263 wounded. About 2,000 Chinese were killed or wounded. A force of 10,000 troops was coming up to re-enforce Gen. Seh when the retreat began, and meeting the retreating soldiers it faced about and retired. The frost and snow made the movements of the invaders slow and difficult. Re-enforcements were sent to Gen. Sung, who reported that his force was at the mercy of the Japanese. The Japanese made no further advance, and the Peking authorities were led to believe that they were weakened by disease and exposure, and that with new troops and a new commander the fortunes of war would change. Therefore an embassy that was about to depart for Japan to sue for peace was detained.

When Prince Kung was called to power, after the dismissal of Li-Hung-Chang from all his functions except the Viceroyalty of Pechili, he endeavored to introduce reforms, and asked the advice of the Viceroy. Every scheme that was suggested was vetoed by the ignorant and incompetent Grand Council. But after Prince Kung was made the head of this body, while retaining the presidency of the Tsung-Li-Ya-

men, the Viceroy Li was restored in part to his former position of dignity and influence. The Empress Dowager gave support to the efforts of Prince Kung, her former enemy, to extricate China from its difficulties with the help of her old ally. Gen. von Hanneken was intrusted with the reorganization of the army.

In the 14 land battles and 2 naval engagements fought up to the end of 1894 the Japanese lost 430 killed and 1,712 wounded, while the Chinese lost 6,676 killed and 9,696 wounded. The war material taken by the Japanese included 670 Krupp guns, with 2,601,741 rounds of ammunition, and 7,645 rifles, with 77,458,785 rounds, 3,326 tents, and 477 stands of colors. Over 90,000 bushels of rice and grain also fell into their hands, and about \$1,000,000 in gold and silver. The total plunder was valued at \$7,312,000, and the buildings, armament, and plant at Port Arthur were estimated at \$70,000,000. The naval prizes were 2 gunboats and a steel cruiser, besides steam launches, junks, and sailing vessels. One ironclad and 3 steel cruisers had been sunk. The territory occupied was double the area of Japan.

Liu-Kun-Yih, Viceroy of Liang-Kiang, was appointed by an imperial edict commander-in-chief of all the Chinese forces. Gens. Huan, Chao, WeiJu, and Chang, who had lost battles, went into hiding to escape being handed over to the Board of Punishments. Gen. WeiJu was afterward captured by Li-Hung-Chang, and was beheaded for cowardice and extortion.

On Jan. 17 two Chinese forces marched respectively from Niuchuang and Liao-Yang, about 14,000 strong, against the intrenched position of the Japanese at Hai-Tcheng. They opened fire with artillery, but Gen. Katsura soon took the offensive and drove back the Chinese, capturing 5 of their guns. Gens. Chang and Tui, the two commanders, were killed in the battle. On Jan. 22 another attack was made by 12,000 men from Liao-Yang, who were beaten by a flank movement with heavy losses. Gen. Nodzu arranged the defense in such a manner as to draw the Chinese, who were led by the Tartar Gen. Chang-Shun, within 650 yards of his line, where they were suddenly attacked in the right flank by a brigade of infantry and three batteries. Gen. Seh advanced on the same day from the port of Niuchuang with 10,000 men and a strong force of artillery to attempt the recapture of Kaiphing. An artillery engagement took place on Jan. 24, which ended in the rout of the Chinese, who worked their guns well until they were demoralized by the shrapnel bursting among them and killing a great number, while the Japanese gunners suffered little, being under cover.

On Feb. 16 the Chinese, 16,000 strong, unexpectedly attacked the position at Hai-Tcheng, and were beaten by the more accurate artillery fire of the Japanese with a loss of over 150 men. On the 21st another attack was made by 12,000 men of all arms on three sides of the Japanese position, but the Chinese were never able to come to close quarters owing to the steady and well-directed fire of Gen. Nodzu's artillery. On the 24th an attempt was made by 7,000 men to surprise the Japanese left, and later in the day an attack

was delivered on the main position by 13,000 men, with 20 guns. After an artillery duel the Japanese advanced from their intrenchments, and the Chinese held their ground valiantly and finally withdrew in good order after inflicting a loss of 270 upon the enemy.

The Siege of Wei-Hai-Wei.—In the second week of January, 1895, a third army, numbering about 25,000 men, set out from Japan in 50 transports. The troops landed at various points on the Shan-Tung peninsula with the object of closing in upon the naval fortress of Wei-Hai-Wei and capturing it by the same tactics that were pursued at Port Arthur. Marshal Oyama crossed over with his staff from Port Arthur and assumed direction of the operations.

On Jan. 18 and 19 the Japanese ships bombarded Tung-Chow in order to divert the attention of the Chinese from the real objective. On the following day the main body under Gen. Sakuma landed in the bay of Yung-Tcheng, 28 miles east of Wei-Hai-Wei. Another landing was effected on Jan. 24 at Ninghai, at the same distance on the other side of the great naval stronghold, where the Chinese fleet lay at anchor under the protection of the forts.

A force of 500 men, with 4 Krupp guns, had been sent to Yung-Tcheng from Wei-Hai-Wei when the Japanese war ships were seen off the promontory. The first boatloads of Japanese were landed unobserved in a snowstorm, and when the Chinese opened fire on the boats the guns of the war ships soon compelled them to abandon their position, and a bayonet charge put an end to all resistance. In their flight they left behind their cannon. The town of Yung-Tcheng was occupied after a show of resistance, with a large quantity of arms, ammunition, and stores.

A Japanese fleet, consisting of 20 war ships, 19 transports, and 20 torpedo boats, took its station, on Jan. 26, at the entrance of Wei-Hai-Wei harbor. It was many days before the heavy guns and all the supplies and materials for the siege were got on shore. The Japanese then advanced, and drew a close cordon around the Chinese stronghold on the land side. On Jan. 26 and 27 reconnaissances were made, and the range was tested by the large and small guns of the fleet.

On Jan. 30 the Japanese advanced under cover of the night to attack the eastern forts of Wei-Hai-Wei. The Chinese had apparently no pickets out, and seemed to be taken completely by surprise when the enemy's batteries opened fire upon the works at daybreak.

A part of the Sendai division took up an elevated position opposite Rankako Shan, a hill fort commanding the eastern land approach to Wei-Hai-Wei. At daybreak two batteries opened fire upon their trenches, and, after a brisk cannonade on both sides, the Chinese guns, which had distributed shells over a wide area instead of concentrating their fire upon the attacking batteries, began to weaken. Then the infantry, which had worked its way round through ravines to within 500 yards of the position, poured a hail of musketry into the trenches and charged the already fleeing Chinamen. Four Krupp field guns were captured.

In the center and on the right the main body

of the Sendai division and the men of the Kumamoto division had passed by this fort to take up stations on the hills overlooking the sea batteries. Two redoubts recently built to command the landward approach were first stormed by the Kumamoto men, who immediately turned the guns on the Chinese forts, and were shelled by them in return, and by the island forts and the Chinese men-of-war, none of which could get the range. The Japanese cruisers "Naniwa," "Akitsushima," and "Katsuragi" opened fire at long range to draw the fire of the Chinese off the land forces, and were answered by the western batteries. The magazine of the northernmost but one of the 8 modern forts was exploded by a bursting shell, demolishing the structure and killing all the defenders. The Kumamoto brigade, under Gen. Otera, then rushed upon one fort after another, in spite of the shelling from the harbor. The Chinese, unnerved by the terrific explosion, fled as soon as they saw bayonets in the distance from one fort to the next, and then along the beach to Wei-Hai-Wei. A second fort they blew up themselves, and they had laid trains to explode the remaining magazines, and thus dismantle all the guns, but the Japanese came in time to put out the fuses. Gen. Otera was killed by a fragment of a shell from the Chinese war ships, which steamed slowly up and down in front of the forts, firing whenever the enemy presented a mark. The Kumamoto men pursued the fleeing Chinese, and the Sendai men joined them, coming down from the hills into a broad, treeless plain, a Chinese gunboat that was waiting for them killed 80 with its machine guns before they could get under cover. There were 11 powerful pieces of artillery left, which the Japanese could use against the island forts. When expert gunners were landed from the Japanese fleet to work the 25-ton guns, the Chinese ships ceased the bombardment of the forts and sought the shelter of the island of Liu-Kung-Tao. The Kumamoto brigade that did all the fighting lost only 30 or 40 men in taking the forts, the rest of the 233 men killed were struck by shot and shell from the ships and the island forts. The main body of Marshal Oyama's army had taken the route over the steep heights back of the forts in the expectation of finding the Chinese posted there in force, but they met none of the enemy.

The Chinese troops after this battle had no disposition to meet the Japanese again. Some of those who fled to Chefoo were beleagued, as a warning to the rest, but this had no effect. The whole land force, about 9,000 men, melted away, and Admiral Ting sent men to disable such of the guns in the western forts as could be used effectively against the island and the ships, which were not as well sheltered from these forts as they were from the eastern batteries. When the garrison of the western forts fled en masse, Gen. Tai, one of the commanders, went over to Liu-Kung-Tao and there committed suicide. The Japanese commander, not aware of the flight of the army, laid his plans cautiously to attack the town of Wei-Hai-Wei from the rear. The vanguard of the Sendai division, marching through the drifting snow, met and attacked the retreating Chinese on the Chefoo road Feb. 2,

and had a hard fight against superior numbers. When the troops approached Wei-Hai-Wei, where they expected to find the Chinese army re-enforced by 8,000 troops from Chefoo, they found instead that the place had been abandoned. They occupied the town and the adjacent western forts on Feb. 2. On Feb. 3 a heavy bombardment of Liu-Kung-Tao was begun on sea and land. The ironclad "Ting-Yuen" and the cruiser "Lai-Yuen," with two gunboats, took an active part in the defense, leaving the shelter of the island and drawing the fire of the Japanese cruisers. Fort Zhih was greatly damaged by the Japanese shells, and some of the Chinese vessels were hit. The Japanese torpedo flotilla made a first unsuccessful attempt to enter the harbor in the night of Jan. 30. The Japanese gunners in the western forts mistook them for Chinese craft and began firing, thus calling the attention of the Chinese, and compelling the torpedo fleet to retreat. Two nights later they tried again to steal in, but found that the Chinese scouts were this time on the watch. The only place where they could pass the booms and sunken mines was a narrow eddying passage close inshore. If it had not been for the booms and torpedo mines at the entrance of the harbor, the "Ting-Yuen" and "Chen-Yuen" armorclads could have dashed out and engaged the Japanese cruisers with a fair chance of success. The bombardment was renewed on Feb. 4, and in the night the Japanese torpedo boats succeeded in creeping into the harbor and disabled the "Ting-Yuen," with the loss of one torpedo boat and injury to others. The firing was continued the next day, and at night the torpedo boats again entered the harbor and, having cut the boom, they returned night after night. They attacked and sank the "Lai-Yuen" and a gunboat, and disabled the "Chen-Yuen." Another ship, the "Wei-Yuen," was sunk by the fire from the eastern forts. A fort on the island of Jitsu that had been very active was demolished on the 8th by the explosion of the magazine. The cannonading was continued day after day. The Chinese battered the land forts till three of them were practically destroyed, but they could not touch the Japanese ships, which the Japanese commander took extreme care not to expose to danger. On the 7th the Japanese opened fire at daybreak on the north side of the island, intending to cover a landing. As the island could no longer be defended, Admiral Ting for the first time attempted a counter-attack. He sent out the entire flotilla of torpedo boats by the western channel, hoping to take the enemy by surprise. Two cruisers also made their way out. The Japanese were on the alert, and after the torpedo boats had passed the boom the "Yoshino," "Takachiho," "Akitsu," "Chiyoda," and "Naniwa" appeared at once. The torpedo boats, which were proceeding in two lines, broke their order and put back at full speed, but they were unable to reach the passage, and were almost surrounded by the cruisers, most of which could steam 20 knots to their 18. These soon had their quick-firing guns leveled at the torpedo boats, which broke through the line before it closed in upon them and fled westward near the shore, badly damaged by the shots from machine guns and hotly pursued by the cruisers. Seven of

the torpedo boats were overtaken and captured or sunk, and the remaining 6 were driven into the inlets and abandoned, their crews making their way across the ice to the beach, where most of them were taken prisoners. Of the 13 boats 8 were found to be sufficiently seaworthy and were added to the Japanese fleet. The boom where the Japanese had made the first breach was cut away, so that free ingress was assured at any stage of the tide. The "Ching-Yuen" went down on Jan. 9, struck by a shell from the eastern forts. On the following day the Japanese got a mortar battery into position in the western forts, and partly silenced the fort at Koto and hindered the ships by an exceedingly accurate fire of shrapnel. The big guns of the Chinese were useless, owing to poor gunnery and adulterated powder.

All Admiral Ting's plans of defense had failed. The land forces, which could have guarded the approaches to Wei-Hai-Wei against much superior numbers, had run away without first dismantling the forts. Admiral Ting had decided to dismantle both forts before the fighting began, but the Chinese general refused to allow it, and telegraphed to Peking a report of treachery. After they had fallen into Japanese hands, the guns of the eastern forts prevented the Chinese ships from guarding the harbor obstructions, and the Japanese torpedo boats were therefore enabled to destroy the ships one after another. After the loss of the torpedo flotilla and of more than half the fleet, the fall of the fortress could not be delayed many days.

In a letter addressed on Jan. 20 to Admiral Ting, a friend of many years' standing, by Vice-Admiral Ito, signed also by Marshal Oyama, the Japanese commander begged the Chinese admiral to surrender and take refuge in Japan until he could return to China to take a leading part in the reformation of his country, which could no longer hold its place in the world if it continued to pursue ancient methods and to confide its destinies to literary scholars trained only in the traditions of a thousand years ago. To this letter Admiral Ting returned no answer, deeming the proposals dishonorable. On Feb. 12 he addressed to Admiral Ito the following letter:

I received the letter of suggestions addressed to me by the officer commanding the united Japanese squadrons, but did not reply because our countries were at war. Now, however, having fought resolutely, having had my ships sunk and my men decimated, I am minded to give up the contest, and to ask for a cessation of hostilities in order to save the lives of my people. I will surrender to Japan the ships of war now in Wei-Hai-Wei harbor, together with the Liu-kung island forts and the armament, provided that my request be complied with—namely, that the lives of all persons connected with the army and navy, Chinese and foreign, be uninjured, and that they be allowed to return to their homes. If this be acceded to, the commander in chief of the British naval squadron will become guarantor. I submit this proposal, and shall be glad to have a speedy reply.

Admiral Ito at once accepted these terms of surrender and dispensed with the foreign guarantee, writing that he placed implicit reliance on Admiral Ting's assurances as an officer. After writing a second letter asking to have the date of the surrender postponed till Feb. 16,

Admiral Ting committed suicide by poisoning. His example was followed by Gen. Chang, commander of the military garrison of 2,000 men, and by Commodore Liu. Admiral Ito restored one of the men-of-war in order that the bodies of the three officers might be carried home in state, and when the vessel steamed out of the harbor the Japanese ships manned their yards and fired a salute in memory of the brave Chinese commander, Admiral John McClure, a Scotchman, who had been transferred from the Chinese civil service to the navy, carried out the terms of the surrender. The "Chen-Yuen" and six gunboats were all that remained of the Chinese fleet. The foreigners in the fort were released with the exception of John Wilde, *alias* William Howie, an American citizen who had been taken off a French merchant vessel at Kobe in November, 1894, while on the way to China to employ a new explosive against the Japanese fleet. Having broken his parole, he was retained for trial. After destroying the land forts at Wei-Hai-Wei, the Japanese withdrew from the Shan-Tung peninsula, leaving a garrison only on the island of Liu-Kung-Tao, where the armament was left in position.

The Capture of Niuchuang.—The Japanese positions at Hal-Tcheng and Kaiphing became insecure after the Chinese had been re-enforced by fresh troops from the interior of China and from Mongolia, of better fighting qualities than most of those that the Japanese had encountered hitherto. Gen. Nodzu determined, therefore, after the forces that had been engaged at Wei-Hai-Wei were freed and had returned to Talienwan, to assume the aggressive again. On Feb. 27 the Chinese were driven out of their advanced positions in the direction of Liao-Yang, at the cost of 110 Japanese killed and wounded, thus rendering the right flank secure, and on March 1 a general advance was made upon Niuchuang by the united forces of Gen. Nodzu and Gen. Yamajio. The attack was made simultaneously on the north and southeast at dawn on March 4. After a bombardment of two hours the Japanese infantry entered the city, where the Chinese troops fought desperately, but were gradually driven back from street to street until at midnight the Japanese were in possession of the town. Houses were blown up with torpedoes, and the town was burned and totally ruined. The Hunan troops of Gen. Wu-Ta-Chang fled at the first encounter, leaving the brunt of the fighting to the forces of Gen. Sung-Ching. The Chinese left behind 1,880 killed and wounded, 600 prisoners, 18 guns, many banners, and great quantities of rifles, ammunition, and provisions. The Japanese loss was 206 killed and wounded.

On the same day the Chinese from Ying-Kow or Ying-Tse, the port of Niuchuang, attacked Gen. Nogi's position at Kaiphing, with 10,000 men. The Japanese repulsed them easily, and, following them up, attacked and captured Ying-Kow on March 6 with trifling loss. The garrison of the town fled at first sight of the Japanese; the artillerists in the fort fired a few ineffectual shots. The troops of Gen. Sung retired across the Liao river westward. The first and second armies were now joined at last. Lieut.-Gen. Katsura on the right advanced toward Liao-

Yang. Gen. Nodzu, now promoted field marshal, pursued Gen. Sung's retreating forces and attacked them on March 9 at Thien-Chuang-Thai, or Denshodai, killing about 600, no quarter being given to combatants. Gen. Wu with 20,000 men had again decamped, leaving Gen. Sung to defend the place with 8,000. This town, which had contained 30,000 inhabitants and was a depot of war material, was burned to the ground and everything was destroyed except 35 field guns that were taken.

Peace Negotiations.—In spite of the continuous triumphs of Japanese arms and the military helplessness of China, the Pekin Government preserved its attitude of proud superiority. It assumed to place Japan in the position of suing for peace by giving precedence to the proposition of Minister Dun at Tokyo over that made by Minister Denby at Pekin. After the dismissal of the envoy Distiering, who went to Hiroshima without powers of any kind, China requested an armistice, which was refused. Chang-Yen-Huan, late minister to the United States, and Shao-Yu-Lien, Governor of Formosa, were then named as envoys. When they arrived at Hiroshima and met the Japanese Prime Minister and Minister of Foreign Affairs to exchange credentials, it was found that the documents that they brought did not state the subject of negotiation nor confer power to conclude or sign any treaty, but only to report to the Tsung-Li-Yamen for instructions. The Japanese plenipotentiaries refused to enter into discussion with them, and they were escorted to their ship on Feb. 3 and sent home.

After Wei-Hai-Wei had fallen and the Japanese army was preparing to advance to the Great Wall and onward to Pekin as soon as the ice should break, the authorities at Pekin first listened to the enemies of Li-Hung-Chang, who laid to his charge the political demoralization and military impotency of the country. The Empress Dowager, his old political ally, could not save him from disgrace. He was stripped of his honors and of all his offices save the Vice-royalty of Chihli. One learned memorialist urged that, since repeating rifles had proved useless, in the hands of Chinese and Manchus soldiers they should be armed with jingals, with which they had conquered their enemies of old. The court at Pekin did not know that the Chinese were losing until Sung and Wu retreated from Niuchuang. The members of the imperial family were then convinced and lost confidence in their conservative advisers, who had no practical plan to save the capital and the dynasty. When Prince Kung, the Emperor's uncle, who had been recalled to the head of the Tsung-Li-Yamen, was made chief of the Board of Censors also, he was persuaded to restore Li-Hung-Chang, once his political adversary, to his former rank and dignities, and to send him, as the only statesman well versed in the forms and conditions of international dealings, with full powers to conclude peace on the most honorable terms that could be obtained. A request was made that Japanese commissioners might meet Li-Hung-Chang at Port Arthur, to which the Japanese Government replied with a refusal to treat anywhere but on Japanese soil. Accompanied by Li-Ching-Fong, late minister to Japan, after-

ward made an associate plenipotentiary, and by an American, John W. Foster, as legal adviser, the Chinese plenipotentiary arrived in Shimonoseki on March 19. This port was chosen for the conferences because the Chinese could there communicate directly with their Government by cable. As conditions for an armistice the Japanese Government first demanded the surrender of Taku, with its forts Tientsin and Shan-Hai-Kwan as a guarantee, but Li would not accede to this, and even sought to obtain a promise that the Japanese would not advance upon Taku or Shan-Hai-Kwan pending the negotiations, lest the confusion and alarm that such a movement would produce at the capital should prevent the conclusion of an honorable peace. Count Ito would not agree to an armistice except on the conditions named, and at the next meeting, on March 24, informed the Chinese envoy of the intention of the Japanese troops to occupy Formosa.

The war party in Japan was agitating against the conclusion of peace before the Japanese army entered Peking. When Li-Hung-Chang was returning from this second meeting a young fanatical patriot named Koyama, one of the class of political desperadoes called Soshis, shot him with a pistol, the bullet penetrating his upper jaw. In consequence of this attempted assassination of the Chinese envoy the Mikado, on March 30, proclaimed an unconditional armistice, with the exclusion of Formosa. The wound healed readily.

On April 1 the Japanese plenipotentiaries submitted the first draft of a treaty, providing for the independence of Korea, cession of Manchuria, Formosa, and the Pescadores, the payment of an indemnity of 300,000,000 taels, the opening of 7 new treaty ports, the abolition of the *likin* tax, the free navigation of certain water ways, the removal of the bar in the Woosung river, and the temporary occupation of Wei-Hai-Wei and Mukden. The Chinese plenipotentiaries prepared a counter-draft, in which it was proposed that China and Japan should recognize and guarantee the neutrality of Korea, that the cession of territory should be reduced to the Yalu district of Manchuria and the Pescadores, and that the war indemnity should be 100,000,000 taels. Eventually Li-Hung-Chang gave way on most of the disputed points.

On April 10 the Japanese Premier submitted to the Viceroy Li, then sufficiently recovered to attend the conference, a new draft containing the maximum concessions that Count Ito was willing to give. After exhausting every argument, and protesting that no lasting and sincere peace would follow, and that the European powers would not permit their interests to be thus imperiled, Li-Hung-Chang was forced to accept the Japanese ultimatum.

Treaty of Shimonoseki.—A treaty of peace was signed on April 17 by Li-Hung-Chang and Li-Ching-Fong in behalf of China and by Count Ito and Viscount Mutsu, the Japanese Premier and the Minister of Foreign Affairs, in behalf of Japan. China, in the first article, recognized the complete independence of Korea, and agreed that the payment of tribute and the performance of ceremonies and formalities by Korea to China in derogation of such independence should cease

for the future. In the second article China ceded to Japan in perpetuity and full sovereignty, together with all fortifications, arsenals, and public property therein, the southern part of the province of Feng-Tien, the country included between the Yalu as far as the mouth of the river Anping and the Liao up to Ying-Kow, the boundary running through Feng-Huang and Hai-Tcheng; also the island of Formosa and the Pescadore group of islands. The part of Manchuria ceded was that which the Japanese armies had overrun and occupied, including the Regent's Sword and Port Arthur. The third article provided for the demarcation of the boundaries in Manchuria by a joint commission. The fourth article fixed the war indemnity to be paid by China to Japan at 200,000,000 kuping taels, of which 50,000,000 taels were to be paid in six months, an equal sum at the end of twelve months, and the remainder in six annual installments of the same amount, with interest at 5 per cent. on all unpaid portions from the date the first installment was due, China to have the right to forestall the dates of payment, and all interest to be waived in case the whole indemnity should be paid within three years. The fifth article provided for the emigration within two years of inhabitants of the ceded territories who should not desire to become Japanese subjects; also for the transfer of Formosa within two months from the exchange of ratifications. The sixth article bound China to appoint immediately plenipotentiaries to conclude with Japan a new treaty of commerce and navigation, and a convention to regulate frontier intercourse and trade on the basis of the treaties and conventions subsisting between China and European powers, Japan to receive most-favored-nation treatment pending the conclusion of such treaty and convention. China agreed, in addition, to open within six months as new treaty ports Shashi, in Hupeh, Chung-King, in Szechuen, Suchow, in Kiangsu, and Hangchow, in Chekiang, and to permit Japan to station consuls in these places; also to allow vessels under the Japanese flag to convey passengers and cargo on the upper Yangtse river between Ichang and Chun-King, and on the Woosung river and the canal from Shanghai to Suchow and Hangchow; furthermore, to grant the right to Japanese subjects purchasing goods or produce in the interior of China to rent or hire warehouses without the payment of any taxes or exactions; and, finally, to allow Japanese subjects to engage freely in all kinds of manufacturing industries in the open cities, towns, and ports of China, and to import all kinds of machinery, paying only the stipulated import duties thereon, and on the manufactured products only such island transit dues and other charges as are levied on imported merchandise. The seventh article provided for the evacuation by the armies of Japan within three months of China, excepting Wei-Hai-Wei, which, the eighth article provides, shall be temporarily occupied as a guarantee until the first two installments of the indemnity shall have been paid, and shall then be evacuated, provided the Chinese Government makes arrangements for pledging the customs revenue as security for the remaining part of the indemnity. The ninth article provides for the restoration of prisoners of war, China under-

taking not to ill treat or punish them on their return, and to release all Japanese subjects accused of being spies or charged with other military offenses, nor to punish any Chinese subjects who had been compromised by relations with the Japanese during the war. The tenth article stipulated that all offensive military operations should cease upon the ratification of the treaty, and the eleventh provided for the exchange of ratifications at Chefoo on May 8. Separate articles provided that the Japanese force occupying Wei-Hai-Wei should be limited to one brigade, that China should pay one fourth of the cost of occupation at the rate of 500,000 kuping taels per annum, that the Chinese civil authorities should conform to the orders that the commander of the Japanese army of occupation deems necessary for the health, maintenance, and safety of the troops, and that the Japanese military authorities should have jurisdiction over military offenses.

The Viceroy Li did not take the treaty that he had signed at Peking, but remained in Tientsin in token of the humiliation that he felt at having to accept such hard terms. He was deprived again of most of his offices and power. The Board of Admiralty was abolished, the fleet having been lost. Chang-Chi-Tong, Viceroy of Nankin, and the other enemies of Li-Hung-Chang were not able, however, to break the treaty, because Mr. Foster convinced the Peking authorities that the safety of the capital and of the dynasty was involved.

The armistice was extended to May 8. The Emperor of Japan ratified the treaty three days after it was signed. It was ratified by the Chinese Emperor also, notwithstanding the persistent efforts of the Conservatives and the enemies of Li-Hung-Chang at Peking to have it rejected.

On April 23 the Russian, French, and German ministers at Tokio presented a joint note to the Japanese Government protesting against the cession of the Liao-Tung peninsula, as in Japanese possession it would be a constant menace to Peking and a danger to the independence of Korea, and thus detrimental to the lasting peace of the Orient. The Russian military forces in the Amur province had been increased to 30,000 and the Russian fleet in Chinese waters numbered 22 vessels, including some of Russia's best ironclads. The German Government made preparations to strengthen its naval forces in these waters. The British Government, while refusing to join in the menacing demands of the three powers, advised the Japanese Government to yield. The joint note was submitted by the Japanese ministry to the generals and admirals, who were invited to choose between surrendering Manchuria or engaging in a new war to retain it. The naval commanders replied that scarcely a ship was in thorough fighting trim, that extensive repairs and refitting were needed. The ability of the army to continue offensive operations depended upon the fleet, which must convoy it safely across the Gulf of Pechili. The military organization had been put to a severe strain by the campaigns in Korea, Manchuria, the Liao-Tung peninsula, Shan-Tung, and the Pescadores, and the resources of the administration were nearly exhausted. Even apart from the new complication, the ability of Japan to

undertake the advance upon Peking with an army of 100,000 men was doubtful, though while the peace negotiations were proceeding the war preparations were pushed with ostentatious bustle, and Prince Komatsu, uncle to the Emperor, who had been appointed commander in chief, had set sail for Tientsin under the eyes of the Viceroy Li with 20,000 fresh troops in 55 transports under the convoy of 14 men-of-war. The military men agreed with the officers of the navy that to engage in a war with European powers would be madness. The Japanese Cabinet therefore sought only a dignified mode of submission, and was not displeased at the noisy outbreak of patriotic bravado in the Opposition press, which enabled it to reply to the memoranda of the ministers of the three powers that if it yielded to their demands it would be exposed to an uprising of the Japanese people. The Russian Government, refusing to take into consideration the fear of a revolution in Japan, assumed a more peremptory tone. The Japanese Government in the end, when a Russian ultimatum was imminent, consented to abandon her claim to the Liao-Tung peninsula on terms to be arranged in a supplementary convention. The acceptance of the friendly advice of the intervening powers was signified to their representatives shortly before the exchange of ratifications, and published on May 13 in an imperial rescript, which set forth that the Emperor of Japan, having been constrained to take up arms against China by the desire to secure for the Orient an enduring peace, and recognizing that the recommendation of the three powers was prompted by the same desire, and that China, by concluding a peace, had shown regret for the violation of engagements, accepted the advice of the friendly powers in the interests of peace, and with the desire not to bring added hardship upon Japan, or impede the progress of national destiny by creating new complications and thereby making the situation difficult and retarding the restoration of peace. In the negotiations for the restoration of Feng-Tien, or the peninsula of Liao-Tung, the Japanese declined the mediation of the powers. As compensation for the retrocession of Liao Tung Japan demanded 100,000,000 taels.

To enable the Chinese Government to pay the first installment of the indemnity, due in November, a loan of 400,000,000 francs in gold was taken by Paris and St. Petersburg bankers with the guarantee of the Russian Government. This gold loan, bearing 4 per cent. interest, was issued at 98.9 per cent. It runs thirty-six years, and is inconvertible for fifteen years. The Chinese Government, influenced by English and German advice, refused to accept the Russian guarantee, and for a long time resisted the proposition to pledge the maritime customs as security for the loan, but finally gave way on both points. After the contract had been signed, the Russian Minister of Foreign Affairs requested the Japanese minister to St. Petersburg to state within what period the Japanese would evacuate the Liao-Tung peninsula. The minister replied that Japan would continue the occupation until the indemnity was fully paid. The three powers continued their pressure, though when Japan reduced her demand to 50,000,000

tals Germany first counseled acceptance of the proposition, but later stood by France and Russia in insisting upon a lower price for the evacuation of Liao-Tung. An arrangement was finally reached, and the protocol was signed at Peking early in November. The Tokio Government accepted 30,000,000 taels, to be paid on Nov. 16, as extra indemnity for the revision of the Shimone-seki treaty, and agreed to evacuate Port Arthur on Nov. 30. China is said to have covenanted not to cede any part of the Liao-Tung peninsula to any foreign power. She had already agreed to negotiate a commercial treaty with Japan, for which Li-Hung-Chang was appointed commissioner.

Seizure of the Pescadores.—When the Japanese ministers told Li-Hung-Chang that Japan intended to take possession of Formosa, the Japanese squadron had already sailed on that errand. On March 23 three ships bombarded a fort on Pong-Hu, the largest of the Pescadore Islands, near the western coast of Formosa. The Chinese replied with guns of 15 centimetres, but were not able to hit the ships. A force of 3,000 men was landed with guns, which, with the support of the ships' batteries, cannonaded the fort until the garrison left it. The Japanese entered it early the next morning, and then marched upon the fortified town of Makung, which was evacuated after an hour's musketry firing. The Japanese lost 1 killed and 27 wounded, while the Chinese losses were 50 killed and 60 taken prisoners. The garrison departed in junks for Fisher Island, and with the garrison there sailed for the Chinese mainland. This island was occupied on March 27. A garrison of 3,000 men was placed in Makung.

End of the War.—Besides the operations in the Pescadores and Formosa, the Japanese seized the island of Yuchow, bombarded the forts at Haichow, on the Kiangsu coast, and on March 24 landed a force and temporarily occupied that town after a sharp fight in which the Chinese lost 300 killed. In preparation for the advance upon Shanhaikwan they took the island of Taohua, which lies midway between Kinchow and that city. After the treaty was ratified the troops were gradually withdrawn from all points except Port Arthur and Wei-Hai-Wei. The imperial guard, which had come to lead in the advance upon Peking, was dispatched to Formosa to reduce the rebellion there. The other troops returned to Japan, and were disbanded. The war was officially declared to be at an end on June 8. The effective strength of the Japanese forces that fought in China was 60,979, of which number 39,097 formed the first army, 19,919 the second army, and 1,963 were sent afterward. The number actually supplied from Japan was more than double the fighting force, which was attended by coolies for transport, road-making, and the like. The total number of deaths in the army from the beginning of the Korean campaign, in June, 1894, till the return of the troops in June, 1895, was 4,110, of whom 734 were killed in battle, 231 died from wounds, and 3,145 died from disease. Of these last, 1,602 died of cholera, of which there were 2,869 cases among the troops. The actual cost of the war was 150,000,000 yen.

Subjugation of Formosa.—Li-Ching-Fang, the Viceroy's son, and Mr. Foster went to For-

mosa to transfer the government to the Japanese authorities. The Chinese Governor lost control over the troops and people when the cession of the island became known. The leaders of the Black Flags and the *literati* made preparations to resist the Japanese, and anarchy prevailed to such an extent that British and German marines were landed at Auping to protect European lives and property. In the south the savage aborigines raided Chinese settlements and plantations. There were about 30,000 Chinese soldiers on the island, most of them lawless Kwangtung men, including many of the fearless warriors who had fought the French. These troops, whose pay was many months in arrears, mutinied against their commanders and pillaged the inhabitants. The Governor and all the civil and military officers were recalled to China by an imperial decree promulgated on May 21, but the Governor did not obey, and no steps were taken to withdraw the turbulent soldiery. Luu-Vinh-Phuoc, the old chief of the Black Flags, took the lead in a revolt against the new rulers. The Chinese Government sent 5,000 more troops to the island from Canton to suppress the Black Flags, and most of these joined the rebels. A Hakka chief, called Kuhungkuk, proclaimed himself king in the northern part of the island, and thousands of well-equipped soldiers joined his standard. Finally, Tang-Ching-Sung, the Chinese Governor, encouraged by Chinese officials in Canton and Nankin, on May 24, proclaimed an independent republic with himself as president, and appealed to the French republic and to Spain for aid. Two or three days afterward a Japanese fleet arrived at Tamsui, where the Chinese officials refused to allow the Japanese to land. Torpedoes blocked the entrance to the harbor. Chang-Chi-Tong, Viceroy of Nankin, sent troops and munitions to assist the rebels. The forces of the nominal republic, which was understood by the population to be an official device, were said to number 100,000 Canton, Honan, and Swatow braves and Hakka militia, all well armed with Mauser and Lee rifles and Winchester carbines, and well supplied with ammunition. On May 30 a Japanese force landed on an island at Kelung, which was valiantly and ably defended. The formal transfer of the island to Viscount Kabayama, the Japanese Governor-General, took place on June 2 on board a vessel at Kelung. Lord Li included the cable in the list of Government property and offered a statement concerning the condition of affairs, but withdrew it when the Japanese commissioner explained that if the Chinese authorities had official cognizance of the insurrection they were bound to suppress it. The next morning the Japanese landed in force, and occupied Kelung after several hours of severe fighting, in which 200 Chinese and 8 Japanese were killed. As Taipeh-Fu, the capital, was only a short distance away, President Tang and the other officials took flight and went on board a German passenger steamer. The forts at Tamsui tried to detain this vessel, compelled the delivery of treasure to pay the garrison, and fired upon her, killing 7 men, upon which the German gunboat "Itlis" bombarded the forts, killing 13 men, and the Chinese gunners then fled. Only Cantonese fought the Japanese, as the

northern soldiers refused. At Taipei pillage and arson ensued, and in an explosion of the powder magazine many Chinese were killed. The Japanese established their headquarters in this town on June 5, where they were welcomed by the native population. A detachment of Japanese which attacked the forts at Chi-Lu-Shantao lost 30 men and killed 80. At Shiu Fan-Chow, also, the Chinese offered a stubborn resistance. After a week order was established in the vicinity of the capital part of the island. The Chinese soldiers who surrendered were disarmed, and departed to China.

The Black Flags, led by Lin-Yung-Fu, con-

and, together with the Hakkas and other Chinese inhabitants of the island, kept the Japanese on the defensive. The latter were compelled to increase the army of occupation from 40,000 to 60,000, and more were killed in three months of the Formosa campaign than during the entire Chinese war. Even after all the fortified posts were captured and the Black Flags dispersed and leaderless, the natives were still so hostile that fresh troops were sent to the island in November to replace those who were worn out by fatigue or weakened by illness.

The island of Formosa has an area of 8,730 square miles, and about 2,500,000 inhabitants.

centrated at Anping, on the west coast, where they levied exactions on the Chinese inhabitants. When a Japanese cruiser appeared she was fired upon here and at Takau. The Black Flags fortified their position at Anping strongly and attacked the positions of the Japanese frequently, captured commissariat stores, and gave them all they could do to hold their positions and protect the communications until large re-enforcements came. The Japanese were not ready to advance upon Anping till near the end of July. When they made the attack they were held in check, in spite of their mountain and machine guns, by rifles behind loopholed walls and stockades. The troops of Gen. Kawaymura attacked the rebels in the middle of August at Shin-Chiku, with the co-operation of two gunboats, and routed them. Taiwan and the other chief towns of southern Formosa were captured, but the Black Flags still held their camp at Anping.

The rich lands on the western side have long been cultivated by Chinese settlers, who raise a vast quantity of rice, sugar enough to supply Japan and partly supply the refineries of Canton, and an excellent quality of tea, which is exported to the United States. The civilized natives work for the Chinese, while the independent Formosans, who hold the mountainous central districts and the whole western part of the island, are hostile and commit many depredations. The forest products are various, the most valuable being camphor. The aloe, the casia, and the tree that supplies the material for pith paper are also abundant. Other products are cereals, indigo, taro, sweet potatoes, hemp, rattan, and peanuts. Coal and petroleum exist in large quantities, and gold has been found.

Outrages upon Missionaries.—The effect of the Japanese war was to stir the antipathy of the inhabitants of various inland provinces to-

ward foreigners, especially Christians. Superstitious prejudices were as usual played upon and the fanatical rancor inflamed by ambitious *literals*. Near the seat of war fugitive soldiers and impoverished vagrants committed depredations, but not on the missions alone, and the

accompanying illustrations, which are fac-similes of two anti-Christian cartoons.) In these publications the people are advised to assault and mutilate the missionaries and their wives.

On May 28 the Canadian mission at Chengtu was attacked by rioters. The missionaries kept

missionaries who were in danger made their escape, usually to the treaty ports. Dr. Randle, an American missionary, was maltreated at Ping-Fu on May 7 by soldiers, who were afterward punished. The serious outbreaks occurred in central and southern China, where the Chinese stock is purest, the military and national spirit strongest, the hatred of "foreign devils" keenest, and the power of the Pekin authorities least effective. Secret political societies seeking the overthrow of the Manchu dynasty are capable of inciting outrages against Europeans for the very purpose of embroiling the Government with foreign powers, and bringing about a situation in which revolution would be possible. The disasters of the Japanese war cost the Central Government nearly all the prestige and authority it had in the provinces where the anti-dynastic feeling is rife, and in these provinces, the most ingrained with the traditional religion and morality, and impermeable to Christian instruction, the antipathy of the people toward Europeans was now intensified, because from Europe came the arms and tactics that enabled the Japanese to conquer Chinese territory.

There is a literary bureau in Hunan active in spite of the efforts of the central authorities to suppress it, from which are sent out placards, pictures, and pamphlets representing Christ as a pig and missionaries as ghouls who kill Chinese children in order to get their eyes and brains and livers for use in Western arts. (See the two

the mob at bay for some time, but they finally fled for their lives, and their chapel and hospital were looted and burned. The temper of the populace was known to have been for some time in a dangerously excited state, yet the officials took no measures for the security of foreigners. The immediate cause of the outbreak is said to have been the act of one of the medical missionaries in seizing a boy, one of a crowd that persisted in throwing stones at him, and locking him in the chapel. After the looting the boy was found dead and mutilated. An immense crowd gathered. Soldiers and others dug up the ground under the mission buildings, and bones were produced that were declared to be those of children murdered by missionaries. The chief of police, a Taotai from Hunan, issued a proclamation declaring that at last evidence had been found that missionaries kidnap small children. Two missionaries were arrested for trial on this charge. All the missionaries were taken under the protection of the authorities, who did nothing, however, to arrest the pillage and destruction of the missions, which went on from the early morning of May 29. On the contrary, the Viceroy, Liu-Ping-Chang, sent out a telegram stating that the mutilated corpse of a child had been found in a foreign place. The disturbance spread to the other places in Szechuen. The story was placarded everywhere that missionaries had been detected in murdering children to get oil from their bodies. During

the next two days all the missions, English, American, and French, in Kiating, Youshow, Pingshan, Suifu, Chinang, and Sinching were destroyed. Circulars were sent by officials of Hunan and Szechuen to prominent men of Kinkiang and other places urging them to rise at once and drive out the foreign devils, who were corrupting the people and undermining the ancient religion. The missionaries were safely conveyed out of the disturbed districts, but their converts were subjected to dreadful persecution. At Yachan the officials protected mission property, but twenty stations were wrecked. The riots continued through the early part of June.

The French Government was the first to demand reparation, in behalf of the Catholic missions, and in response an imperial decree was issued ordering the damage to be repaired and the malefactors brought to justice. Trials were held in which those who were guilty were accusing witnesses and those who had befriended the missionaries were punished. Before the riots in Szechuen were over an outbreak occurred near Wenchow in Che-Kiang, against native Christians, whose houses and chapels were razed by a mob that accused them of gouging out the eyes of a Taoist idol. The feeling against foreigners spread as far as Yunnan. Minister Denby appealed to all Americans in the interior to repair temporarily to the coast.

On July 31 10 English missionaries of the zeana mission and the Church Missionary Society were massacred without warning by an organized band of 80 armed men at Whasang, a mountain resort near Kueheng, Fukien. The Rev. Dr. Stewart and his wife, a grown daughter, and a child were killed, and their house was then set afire. Misses Marshall, Gordon, Nellie and Topsy Saunders, Hetty Newcombe, and an Irish nurse were tortured and murdered with spears and swords in the sanitarium at Whasang. Four of the Stewart children and 4 woman missionaries were frightfully wounded. Miss Mabel C. Hartford, an American, was knocked down and beaten, but made her escape into the hills. Most of the American Methodist missionaries were absent. All the mission property was destroyed, except Spanish and Russian missions. The woman missionaries were here, as elsewhere, particular objects of fanatical rage.

Kueheng, which has about 50,000 inhabitants, had been in a state of anarchy for some time. A sect of vegetarians, which sprang into sudden prominence during the war, showed special hostility toward Christians. The sect became so numerous and truculent that the mandarin dared not punish its members for crimes, and yielded to them in all things.

The United States minister commissioned J. C. Hixson, consul at Foochow, and Capt. Newell of the "Detroit" to go to Kueheng to inquire into the circumstances of the outrage in conjunction with British investigators. Sheridan P. Read, consul at Tientsin, and Commander Francis M. Barber, naval *attaché* of the legation, were sent to Chengtu to investigate the excesses in Szechuen. The Emperor issued an edict commanding the Tartar generals at Foochow to arrest the rioters and enjoining all viceroys or governors to protect missionaries and

chapels and to issue proclamations exhorting the people not to listen to scurrilous tales which excite unfounded suspicions. The Chinese Government sent mandarins of superior rank to detect and try the perpetrators of the crimes. As a result of the trials, Liu-Ping-Chang, who was immediately deprived of his office, was degraded, as was the Taoist abbot, and some of the rioters were punished as felons. The chiefs of the vegetarian sect at Kueheng were arrested, and of the persons who took part in the murders, 23 out of 130 that were arrested were convicted, and 7 were executed. All the missionaries of the province took refuge at Foochow. The whole province in September was in open insurrection, and the local officials abandoned their posts and fled. An armed mob wrecked the chapel and school of an American mission at Pinghok, near Foochow. Fresh attacks upon missions occurred in various provinces. Placards and pamphlets inveighing against foreigners were distributed in Canton. A mob of roughs attacked the British mission at Fatsan, and a Chinese gunboat was sent to quell the disturbance. The Catholic mission at Wanai was also attacked by bandits, and was defended by the missionaries, who killed some of the marauders. The military authorities of Canton took prompt measures to restore order. Outbreaks occurred also at Chingchow, Taiping, Hupeh, and Anhui. The Chinese Christians were harried and robbed everywhere after the flight of the missionaries.

The French commissioners, one of whom was Bishop Bernard, completed their investigations first, and the French minister obtained from the Chinese Government a promise of full reparation. A convention was concluded, giving to the Roman Catholic Church the privilege of acquiring land in any part of China without the permission of the local authorities. Owners may convey lands or houses by simply signing the title deeds. The Church can not be taxed more than native owners are under the general regulations of the imperial law.

Some of the minor officials were punished for the outrages in Szechuen. The result was far from satisfactory to the English, and their minister, supported by the United States minister, demanded that the Viceroy, Liu-Ping, should be degraded. British war vessels ascended the Yangtse-Kiang, and a naval demonstration was threatened at Nankin. An ultimatum was presented on Sept. 28, and on the day following the Chinese Government announced that the Viceroy of Szechuen had been stripped of his rank for failing to protect missionaries, and that he would never be allowed to hold office again. He had, in fact, been degraded for incompetency and ordered to give up his post before the missionary outrages occurred. Chinese commissioners were sent by the Peking Government to Kueheng, where they held a trial in the presence of the English and American commissioners, the result of which was that 17 other culprits were beheaded.

Mohammedan Revolt.—Besides antimissionary outrages, another consequence of the war was an uprising of the Dunganis of the province of Tsinghai in the Koko-Nor region. The rebels carried Luoting by storm, causing the commandant to commit suicide. The revolt spread

among the Mohammedans of Kansuh. The Viceroy telegraphed for re-enforcements and war material. After the rebels had captured 11 cities Gen. Tung-Fusiang was dispatched, at the head of 25,000 troops, to Lanchow-Fu, the capital of the province, near which place he inflicted several defeats on the rebels. These, however, were constantly gaining fresh adherents, while his troops consisted partly of Mohammedans, who would not fight their coreligionists. Discontented Buddhists joined the Dungans, as the Mohammedans of northwestern China are called, and their forces increased until there were 500,000 under arms. They had the encouragement of the Turkomans of the neighboring Russian provinces and of the secret societies of central China. After an indecisive engagement with Gen. Ma, the leader of the rebellion, Gen. Tung, who lost 3,000 killed in the battle and 5,000 more that deserted to the enemy, reached Lanchow-Fu, and was there closely besieged. The other garrisons of the province, in which there were only 60,000 Chinese troops, were also invested. The cruelties practiced on both sides were as revolting as in the former Mohammedan rebellion, 1862-77.

Franco-Chinese Treaty.—The result of French intervention to save Chinese territory from Japan was a convention settling the northern boundaries of the continuous French possessions in Tonquin and Annam and regulating the commercial relations between French Indo-China and Yunnan. By this agreement Meng and Wuto were ceded to France. This cession is not recognized as valid by Great Britain, because it was held that these districts formed part of the provinces on the upper Mekong that Great Britain conceded to China, so that they might form a buffer state or neutral zone between French Indo-China and Burmah. The convention also sanctions the extension of the Tonquin railroads and telegraphs into Chinese territory. The instrument was signed at Peking on June 20.

CHRISTIAN ENDEAVOR, YOUNG PEOPLE'S SOCIETIES OF. The International Convention of the Young People's Societies of Christian Endeavor met in Boston, Mass., July 11. About 70,000 delegates were in attendance. The statistical report showed that 7,750 new societies had been added during the year, and that the whole number of societies was now 41,220, and the whole number of members was about 2,500,000. Of the societies, 33,412 were in the United States, as against 28,696 in 1894; 3,105 in Canada and Newfoundland, an increase of 1,233 from the previous year; 2,645 in the United Kingdom, 1,509 in Australia, 30 in Africa, 32 in China, 64 in France, 117 in India, 59 in Japan, 93 in Madagascar, 25 in Mexico, 39 in Turkey, 63 in the West India Islands. The societies in the United States included 18 senior societies, 33 mothers' societies, 62 "intermediate companies," 169 societies in schools, colleges, public institutions, prisons, and schools of reform; the North American Union of German Christian Endeavor; 7 societies in the army and navy of the United States; societies among the policemen and patrolmen; companies among the Indians of the North and West; comrades enlisted in work among the life-saving crews, light-houses, and lightships; the Travelers' Union of Christian Endeavor; 158 "floating societies";

and 8,850 junior societies. There were also 339 junior societies in Canada and 224 in other lands, making in all 9,122 junior societies, with 340,000 members. The "Missionary Roll of Honor" bore the names of 5,551 societies, each of which had given not less than \$10 to one of its denominational boards of missions, the whole amount of such gifts having been \$140,719. Adding other gifts for religious and benevolent objects of \$190,884, the aggregate of the contributions of the societies in the United States was \$340,603, and of the United States and Canada \$425,000. The denominations in the United States were represented by the number of societies organized within them in affiliation with the convention in the following order: Presbyterians, Congregationalists, Disciples of Christ and Christians, Baptists, Methodist Episcopal Church, Methodist Protestants, Lutherans, Cumberland Presbyterians, and others. The meetings of the convention were devoted to addresses and religious exercises.

COLOMBIA, a republic in South America. The Senate has 27 members, 3 from each department, elected by indirect suffrage for six years. The House of Representatives has 68 members, 1 to every 50,000 of population, elected for four years by direct vote. Every elector must be twenty-one years of age and either know how to read and write, or be a property owner, or have an income of 500 pesos. The President is elected for six years by an electoral college. The ministers are responsible to the Congress. Miguel A. Caro became President in 1894. The following ministers were in office in the beginning of 1895: Interior, M. A. San Clemente; Foreign Affairs, M. F. Suarez; Justice, A. M. Rueda; Commerce and Communications, B. Bravo; War, J. D. Ospina; Instruction, L. Zerdá; Finance, Abadia Mendez; Public Works, J. de Brigard. The area of the republic has been recently estimated at 464,400 square miles. The population was estimated at 3,878,600 in 1881.

Finances.—The budget for the biennial period 1895-'96 makes the revenue 26,203,966 paper pesos (the value of the peso in exchange is 50 cents), and expenditures 33,801,888 pesos. The customs receipts in 1893 were 9,160,175 pesos.

The foreign debt, contracted in England, amounted on June 30, 1894, to £3,279,828 sterling, including £1,364,328 of unpaid interest. The internal funded debt amounted to 5,466,896 pesos, and other liabilities to 3,946,164 pesos, exclusive of 26,135,606 pesos of paper money.

Commerce and Production.—The value of the imports in 1893 was 13,403,299 pesos; of the exports, 14,630,332 pesos. Manufactured cotton is the most important article of import. It comes from Great Britain, as do woolen and linen manufactures and iron wares. Alimentary substances are imported from the United States and other American countries. The imports from Great Britain, excluding the Panama district, in 1892 were 4,289,276 pesos (1 peso = 97 cents); from France, 2,244,459 pesos; from the United States, 1,861,263 pesos; from Germany, 1,315,430 pesos; from other countries, 2,298,118 pesos. The exports to Great Britain were 5,966,911 pesos; to the United States, 4,855,467 pesos; to France, 1,520,905 pesos; to Germany, 1,450,903 pesos; to other countries, 2,079,615 pesos.

The mineral wealth of Colombia is extraordinary, though owing to difficulties of transport only the most valuable ores and metals can be profitably handled, except the iron found near Bogotá, the capital, and worked up there into cutlery and utensils, and the salt mine in the same district, which is operated by the Government. Gold is found everywhere, and license fees are paid on nearly 5,000 claims. The product is over \$5,000,000 a year. Silver, copper, lead, platinum, quicksilver, cinnabar, magnanese, and emeralds are also mined. There are large deposits of coal, and petroleum has been found. The soil is very fertile. Cattle are raised in the central departments. The chief exports and their values in 1892 were as follow: Coffee, 7,609,000 pesos; precious metals, 3,472,000 pesos; minerals, 620,000 pesos; tobacco, 577,000 pesos; hides, 560,000 pesos; cacao, 436,000 pesos; vegetable ivory, 421,000 pesos; woods, 225,000 pesos; caoutchouc, 228,000 pesos; cattle, 170,000 pesos.

Navigation.—There are only 2 steamers, of 341 tons, and 5 sailing vessels, of 2,179 tons, registered in Colombia. During 1893 there were entered at the ports 1,510 vessels, of 806,297 tons; cleared, 1,475, of 1,430,854 tons. Monthly calls are made at the ports by 32 steamers, of which 15 are English, 9 American, 4 German, 3 French, and 1 Spanish.

Communications.—There were 231 miles of railroads in 1894. The Panama Railroad had a length of 47 miles. The Bolívar line from Barranquilla to Puerto Belillo, 20 miles, was completed, and so was the Cucuta line, running to Villanovar, 34 miles; also the line from Santa Marta to Ciénaga, 20 miles, and the Savanna line, between Facatativa and Bogotá, 24 miles. The Santander line of 75 miles was only begun; of the Cauca line between Buenaventura and Cali 12 miles out of 85 were built; 30 miles of the Antioquia Railroad connecting Medellín with Puerto Berrio, 125 miles, were in operation; the 60 miles between Conejo and Honda were more than half completed; and of the Girardot line, running 93 miles through the mountains from Girardot to Bogotá, 25 miles were constructed, from Girardot to Juntas de Apulo. This last line was begun as a Government enterprise. In 1895 it was handed over to an American company, which has undertaken to build the remaining 68 miles, with the aid of a subsidy of \$16,000 a mile, about one third of the estimated cost, and thus provide steam transportation between the political and commercial capital and the head of navigation on Magdalena river.

The army, which is kept at a strength of 5,500 men, has been employed in improving the highways. The telegraphs in 1894 had a length of 6,835 miles.

The number of internal letters that passed through the post office in 1893 was 1,302,410, including postal cards; of samples, 615,844; of registered letters and packets, 70,008; of foreign letters, 342,440.

The Panama Route.—An arrangement was made between the Colombian Government and the liquidator of the French Panama Company on April 4, 1893, whereby the concession for the construction of an interoceanic canal was prolonged ten years on condition that the new company to be formed should resume work before

Nov. 1, 1894, and pay over to the Government 17,000,000 francs in money and stock.

The original company, organized by Ferdinand de Lesseps in 1881, after receiving 772,545,412 francs up to June 30, 1886, and attempting to raise a loan of 600,000,000 francs in 1888, went into liquidation and suspended work on March 15, 1889. A new French company was incorporated in October, 1894, and work on the canal was resumed *pro forma*. The wages of the laborers and employees having been cut down, they began a strike in January, 1895. Threats were made that Colon would be burned and the railroad property destroyed unless living wages were paid. The outbreak of the revolution encouraged lawlessness and weakened the police powers of the Government. On Feb. 18 three attempts were made to burn Colon. The strike on the canal and the railroad continued, and was joined by the mechanics, many of whom left the country in April. In July the laborers began to return to work at the old rate of wages. In August the canal company prepared to begin work in earnest. Laborers and artisans were hired, and a guard of soldiers, for which the Government charges the company \$10,000 a month, was distributed along the line. Competent experts estimate that the least sum for which the canal can be completed is \$100,000,000. The amount already expended is \$220,000,000.

Revolutionary Uprising.—Avelino Rosas, formerly Governor of Cauca and the recognized head of the radical wing of the Liberal party, planned, in December, 1894, from Curacao an armed attempt against the clerical administration of President Caro, in conjunction with other exiles and their sympathizers in Ecuador and Central America. Gen. Santos Acosta and other Liberal chiefs in Colombia were ready to head uprisings to overthrow the local authorities in the departments of Cauca, Santander, and Magdalena at the same time that Gen. Santo Domingo Vila, ex-Governor of Panama, entered southern Cauca with a strong volunteer force from Ecuador and other expeditions landed from Venezuela, Costa Rica, and the Antilles. The Government was forewarned and prepared to suppress the movement.

The first revolt occurred in Iloca del Toro, where a part of the troops mutinied and declared against the Government. This was easily suppressed without loss of life. In the early part of January an organized body of revolutionary troops entered Colombia from Venezuela at Tachira. They were met by the troops of the Government stationed on the border, and were repulsed, their leaders being captured and imprisoned. On Jan. 28 an uprising with which the authorities were not able to cope occurred at Tolima, in Boyaca. The rebels took the field at once in Cauca, Condumamarca, and Santander. Pasto, Pradera, and other important towns declared for the revolution. At Pradera the Government's authority was restored after a battle in which the revolutionists were defeated. In Bogotá many of the soldiers and police deserted to join the popular movement, and made an attempt to capture the barracks, which the artillery and other loyal troops prevented under the personal direction of President Caro. The fighting

was severe, 300 men being killed. Several of the leading Liberals living in the capital were imprisoned. Cucuta and other points on the frontier were taken by the invading rebels, and arms were introduced freely through Venezuela. The rebels possessed themselves of the Girardot Railroad, and captured 3 of 5 river gunboats that the Governor of Bolivar had equipped on the Magdalena river. They prepared to send an expedition against Honda so as to cut off communications with Bogotá, whence Government re-enforcements were dispatched in haste to defend that place. The capture of Barranquilla made the rebels masters of navigation on the Magdalena, but only until Gen. Rafael Reyes arrived in Cartagena with 1,000 men and 5 river boats. Some foreign residents in Barranquilla, fearing trouble in the city, hoisted the flags of their respective countries. The local authorities ordered them lowered, and issued a decree threatening to fine and imprison any private person displaying a foreign flag. In the battle of Papayo, near Ibaque, the revolutionists sustained a disheartening defeat, 300 of them being captured. Troops were sent out from Cartagena to clear that part of the country of insurgents. The Government continually increased its forces, arming the inhabitants of Cauca, Antioquia, Bolivar, and Magdalena. The rebel forces in Tolima surrendered on Feb. 8 at Chumbamuy. After the route of Tachira on Feb. 5 at Mundo Nuevo, Cundinamarca was cleared of invaders. In the province of Velez and other central districts the rebellion was not yet suppressed, but Government troops closed them in and pursued the principal body toward Sogamoso. A detachment of invaders was routed near Habahia, and 250 prisoners and a large supply of modern rifles were captured. On Feb. 14 the rebels made a brave resistance at Cucuta, and on the following day, after they had been driven out of the town, they returned and attacked the Government forces, and finally expelled them after a desperate battle that lasted from dawn till afternoon, more than 800 being killed on both sides, among them the rebel leader Gen. Cuarto. A small expedition from Port Limon landed at Bocas del Toro on March 8. A fierce attack was made upon the *cuartel*, where the soldiers were surprised in their sleep. The rebels lost their leader, and were repulsed after three hours of fighting. In the evening marines were landed from the United States vessel "Atlanta" to protect American property. The "Raleigh" had before this been ordered to Colon and the "Alert" to Panama, to be ready to land troops, as was done in 1885, in case the revolutionists should attempt to close the Panama Railroad. Gov. Arango declared the department of Panama in a state of siege, and caused a great number of persons to be confined as political prisoners. A fierce battle took place at Barrona, where 300 men were engaged, and 50 fell on both sides. The rebels had previously captured Puerto. A few days later Gen. Martens gained a victory over a large body of rebels at Capitanejo, near Malaga. Battles were fought in Cauca at Cali and Buga. On March 15 the Government forces under Gen. Reyes defeated a large body of revolutionists, and captured the town of Enciso. The rebel loss was reported to

be 1,200 men and that of the Government 700. Many of the loyalist soldiers perished during the forced march. After this decisive engagement the rebels were too much discouraged to take the field again in force, though the army of Gen. Reyes, originally 30,000 strong, had been reduced by deaths and desertion to 8,000. Guerrilla raids continued in the mountainous districts, and martial law was still maintained through the country. Concealed arms were unearthed and confiscated, and the frontier was so closely guarded that attempts to invade the country were finally given up.

To obtain means to prosecute the war the Government raised forced loans, and increased the import duties 15 per cent., and put a heavier export duty on coffee. The collection of a special duty of 10 per cent. on goods destined for the Isthmus of Panama was decided by the courts to be illegal. An extra tax of \$10 a head on all cattle slaughtered was decreed, and the stamp duties and internal-revenue duties were doubled.

Italian Indemnity Claims.—After a long correspondence in relation to claims for damages amounting to over \$600,000 sustained by Italian citizens during the revolution of 1885, the Colombian Government proposed that the matter should be referred to the President of the United States for arbitration. The proposition was accepted by the Italian Government, and in February, 1895, President Cleveland signified his willingness to act as arbitrator.

COLORADO, a Western State, admitted to the Union Aug. 1, 1876; area, 103,925 square miles. The population in 1880 was 194,327; in 1890 it was 412,198. Capital, Denver.

Government.—The following were the State officers during the year: Governor, Albert W. McIntire, Republican; Lieutenant Governor, Jared L. Brush; Secretary of State, Albert B. McGaffey; Treasurer, Harry E. Mulnix; Auditor, C. C. Parks; Superintendent of Education, Anjanette J. Peavey; Attorney-General, B. L. Carr; Chief Justice of the Supreme Court, Charles D. Hoyt; Associate Justices, Luther M. Goddard, and John Campbell.

Finances.—The Treasurer's report shows the balance on hand Nov. 30, 1892, to have been \$850,051.47; the cash receipts during the two years, \$2,502,208.01; and the amount from investment warrants redeemed and interest, \$854,633.41. The cash disbursements were \$2,706,367.04; the warrants bought for investment amounted to \$932,526.28; and the cash in the treasury Nov. 30, 1894 was \$567,999.57. The floating State debt amounted to \$2,488,289.37, and the assets due the State \$1,180,081.59, leaving the net floating debt \$1,308,207.78. The capital bonds amounted to \$600,000.

Education.—The ninth biennial report of the Superintendent of Public Instruction for the two years ending June 30, 1894, gives the school population of 1893 as 116,119 and the attendance 46,187; and the school population of 1894 as 113,384, and the attendance 58,330. The whole amount of money paid for schools in 1894 was \$2,213,723.57, of which \$1,216,324.20 was teachers' wages.

The report of the State University at Boulder shows an enrollment of 159 university students

and 146 preparatory students in 1893-'94, and 181 university and 182 preparatory students for the fall term of 1894 enrolled before Oct. 1. Of the students in the university classes, 113 are in the College of Liberal Arts, 10 in the School of Applied Science, 41 in the School of Medicine, and 17 in the School of Law. A Professor of Philosophy and Pedagogy has been added to the faculty. The collegiate work was completely reorganized in 1893.

The preparatory school has been removed from the campus and established at a distance of several blocks. The city of Boulder assists in maintaining this school, providing rooms, heat, and incidentals, and paying nearly half the salaries. Important improvements have been made at the university, chief of which is the erection of the Hale Scientific Building, a sandstone structure, four stories high, which is occupied chiefly by the classes in science. Three rooms in the main building are used for an art collection given by Col. Ivers Phillips. The first story of an engineering building has been raised and provided with machinery. The proceeds for 1895 from the 4-mill tax will be about \$40,000. For further income the university depends upon special appropriations. The total receipts for the two years ending Oct. 1, 1894, were \$112,082.60, and the disbursements \$107,412.77. Besides this, an appropriation of \$34,000 was made for improving the campus.

The number of students enrolled in the normal school at Greeley for the year ending July 31, 1894, was 363, of whom 275 were girls. In addition there were 30 in the preparatory department, 57 in the model school, and 65 in the kindergarten; 35 diplomas were granted. The 16 teachers employed received in salaries \$22,575. The receipts were \$36,574.45, and the expenses \$34,970.54.

The Denver and Rio Grande Railway Company has established at the Burnham shops a school for apprentices, which in March had an attendance of 22. The pupils are taught mechanics, draughting, mathematics, construction, and other practical branches in such a way that they lose no time, but on the contrary gain both practical and theoretical knowledge as they earn their livelihood.

The yearly receipts for the State Agricultural College and Experiment Station amount to \$78,500, of which \$7,000 comes from the land income fund, derived from interest on the money received from sale of lands given by the Government, and from lease of unsold lands; \$15,000 from the United States fund (Hatch bill) for support of experiment stations; \$20,000 from the United States fund (Morrill bill); \$25,000 from the State tax fund; and \$1,500 from sale of stock and farm products.

The enrollment, Nov. 30, 1893, was 139, and for the fall term 1894 it was 205, of whom 57 were girls. A college experiment station under the control of the State Board of Agriculture is maintained at Fort Collins, and substations at Monument, Rocky Ford, Monte Vista, and Cheyenne Wells. Eight bulletins on farming topics have been issued during the biennial period to citizens of Colorado and other States, and sent to libraries and scientific institutions in this and other countries. A short practical course in

agriculture was given in Agricultural Hall beginning Jan. 8, 1894, to a class of 46.

The ninth annual convention of the Association of American Agricultural Colleges and Experiment Stations met in Denver, July 23. Among resolutions adopted were these:

Inducting the Executive Committee to continue its efforts to secure the establishment of an office of land-grant colleges in the Bureau of Education, Department of the Interior, on the line recommended by the association at the eighth annual convention, the association believing that the provision made for such an office as was contemplated in the recommendation, emphasizing the importance of guarding against the diversion of the Hatch fund from its legitimate objects, viz., agricultural experimentation and research and the dissemination of the results thereof.

State Institutions.—The School for the Deaf and Blind had a total attendance of 178 during the period, with an attendance of 116 at the time of the report. The deaf pupils are organized into 6 classes, and the blind into 4, special instruction being provided for the deaf in art, and for the blind in music.

The number of boys received at the State Industrial School was 147; the number remaining Nov. 1, 1894, was 127. The amount of receipts was \$103,502.25, and the amount expended \$95,937.60.

Railroads.—In his inaugural address the Governor said: "With one principal exception, all the railroads of this State are now in the hands of the courts, and are being managed by receivers. Their business has been greatly diminished, and I believe it is true that there is not a single railroad paying dividends to its stockholders at this time. . . . The decrease in business resulting from the depressed financial condition of the whole country, including Colorado, has reduced the earnings of the railroads to such an extent that in some instances it has become a question whether trains could be run at all." Notwithstanding this fact, at least 11 new roads or extensions are projected in the State, and some are in process of building. The Plateau Valley road, which begins about 18 miles east of Grand Junction and runs to the junction of Grand and Plateau rivers, will be of great service to the western slope. The Midland Terminal is being pushed toward Cripple Creek. Surveyors have begun work on the Florence Southern road, to run from Florence to the Wet Mountain valley. The Gulf is building from Trinidad to Walsenburg. Among other enterprises on which more or less has been accomplished are the White River Valley road, and a railway connection between Durango and Flagstaff, Arizona.

Decision.—It has been decided by Judge Graham that the law prohibiting insurance companies from writing policies on the lives of children under ten years of age is unconstitutional and void. The passage of the law was due to the Colorado Humane Society.

The Capitol.—The General Assembly of this year was the first to occupy the new Capitol building, the outside of which is nearly completed, though much remains to be done on the inside finishing. The appropriations for the building, 1893-'94, amounted to \$2,250,000; for grounds, \$30,000; and for furnishing, \$100,000.

State Lands.—The report on these is as follows: Indemnity school lands, not patented, 455,507.38 acres; selected by former boards, not patented, 40,000 acres; selected by present board, not patented, 59,933.8 acres; total, not patented, 680,441.18 acres. Add school lands in sections 16 and 36, 3,000,000 acres. Total school and indemnity lands, 3,680,441 acres.

The receipts at the State Land Office for two years, ending Nov. 30, 1894, were \$255,753.27, against \$479,705.74 in previous two years.

During August, September, and October, 1894, a larger number of homestead entries was made at the Pueblo land office than in any three months since its establishment, the number being 262. There were 62 more mineral entries this year than last year, and 75 more mineral applications.

The State Land Board has reclaimed many thousand acres of school lands on which payments have not been kept up by the purchasers, but which have been left heretofore in their possession.

Mining.—The strikes that took place among the miners in 1894 reduced the output much below the estimate made at the beginning of the year, especially in reference to the amount produced at Cripple Creek. Notwithstanding this, the gold output of the State was \$4,000,000 larger than that of 1893. More than one third of the entire product of the State was from the Cripple Creek district, which yielded \$4,050,000. It seems to be the fact, as is claimed, that the 4 square miles of this district make up the richest tract of gold-yielding ground of its size on the continent, if not in the world. Leadville, the next most notable gold district of the State, produced nearly \$2,000,000. More than half of this came from one mine, the Little Johnnie, and all from about 4 properties, while at Cripple Creek the paying mines are more numerous and the profits more widely distributed. Activity in gold mining has made San Miguel the most prosperous of all the counties of the Southwest. Gilpin County, which stood second in 1893, took third position in 1894 by Leadville's large output, though its yield was actually larger than during the former year. Goose Creek, in Gunnison County, is a new gold section that promises well, and new mines were opened in Gilpin, Clear Creek, and Boulder Counties, the old properties in which continued to be productive.

Leadville is still the largest silver producer of the State, the product for 1894 being 7,889,992 ounces. The figures representing the mineral yield of 1894 are as follow: Gold, \$11,750,000; silver, 26,300,000 ounces; lead, 131,394,000 pounds; copper, 8,348,441 pounds.

Statements by 5 smelters of the State show that their purchases of gold, silver, and copper ore were greater during the first six months of 1895 than during the same months in 1894, while those of lead were smaller.

Vulcan, in Gunnison County, 12 miles south of Gunnison city, and partly also in Saguache County, is the newest mining town in the State. Prospecting has been done there for some years at times; it has now been found that a mineral-bearing quartz that had been observed on the surface, but passed by as valueless, is rich in gold, and the place has been rapidly filled with pros-

pectors and miners. The population in September was nearly 400.

A large deposit of valuable manganese ore is said to have been found about 20 miles south of Silver Cliff, in Custer County, and claims have been filed on about 1,000 acres.

The total coal product of the State for 1894 was 2,994,028 short tons, a decrease of 953,028 from that of 1893. This decrease was due to the strike, which kept 4,000 or 5,000 coal miners out of work for several months. There were 19 fatal accidents in coal mines, 15 of which were caused by the fall of rock and coal and by the bad management of inexperienced miners.

Farming.—The value of the agricultural product for 1894 was given in round numbers at \$75,000,000. It is estimated that 4,000,000 acres of land are supplied with irrigating ditches. This does not mean that there are 4,000,000 irrigated and cultivated to-day, but there are that many acres now under systems of ditches and canals that eventually will produce cultivated crops. Of the 4,000,000 acres there are 2,500,000 acres under actual cultivation. During the year 303 ditch surveys were recorded, but there is no record of the amount of work accomplished. There are in the State 1,000,000 acres of vega or meadow lands that never require artificial irrigation and another 1,000,000 acres of fenced pasture lands adapted to the growing of small grain without other irrigation than the rainfall.

The prevailing tendency appears to be toward the production of fruit. The orchard acreage of the State amounts to 100,000 acres, with a fair valuation, merging old and new orchards into one, of \$50 an acre. The fruit output for 1894 amounted to \$3,000,000. Mesa County is one of the new fruit-producing districts. The western slope is developing into a grape-growing section, some varieties being successfully grown which have heretofore been supposed to flourish only in California. The amount of alfalfa annually cut is estimated at 2,500,000 tons; the wool clip for 1894 amounted to 12,000,000 pounds, valued at \$3,000,000; and the annual potato crop amounts to about 150,000 tons, valued at \$3,000,000.

Mining and Industrial Exposition.—The twentieth anniversary of the admission of Colorado to the Union was to be celebrated in 1896 by an exposition at Denver of the products of the State and of the West. A site was selected and secured—120 acres of land in the southeast portion of City Park and 30 acres of the school land adjoining on the south. But finally the enterprise was abandoned.

CONGO, INDEPENDENT STATE OF THE, a sovereign monarchical state created with the consent of all the powers and declared perpetually neutral in conformity with the general act of the Congo, which was signed at Berlin, Feb. 26, 1885. Leopold II, King of the Belgians, who was declared its sovereign, ceded his sovereign rights to Belgium by his will, made on Aug. 2, 1889. By a convention made on July 3, 1890, Belgium acquired the right to annex the State after a period of ten years. A codicil of the will, dated July 21, 1890, declares the territories of the State to be inalienable. The convention mentioned above was ratified by the Belgian Chambers on July 25, 1890. A single Secretary of State has direction over all the

branches of the Central Government, of which Brussels is the seat. Edmond van Katviele holds this post. The Governor-General, who is the head of the local government established at Boma, is Theodore Wahls.

Area and Population.—The area of the Congo State is estimated at 870,000 square miles, and the population at 14,000,000. The number of Europeans at the end of 1891 was 950, of whom 445 were Belgians.

Finances.—The budget for 1894 made the revenue 4,949,444 francs, of which 1,157,720 francs came from the customs duties that the Congress of Brussels, revoking the former inhibition, authorized the Independent State to levy for the purpose of suppressing the slave trade. Other local sources of revenue were expected to yield 891,724 francs, and the rest came from the Belgian treasury, which advances 2,000,000 francs a year, and the King-Sovereign, who gives 1,000,000 francs. The expenditures were expected to amount to 7,083,534 francs, of which 2,308,600 francs were for the public force, 948,756 francs for caravans, 897,200 francs for civil administration in Africa, 597,487 francs for public works, 492,260 francs for the naval service, 324,000 francs for the service in Europe, and 916,200 francs for miscellaneous expenditures.

There is a debt of the nominal amount of 150,000,000 francs, contracted in 1888. The Belgian Government by the convention of July 3, 1890, made a loan of 25,000,000 francs extending over ten years. Besides these debts the State has floating and temporary liabilities.

The Armed Forces.—The military force of the Independent State consists of 16 companies of native soldiery, numbering about 9,000 men, commanded by 143 European officers and 146 under officers.

There are 7 armed steamers on the lower and 12 on the upper Congo, besides sailboats.

Commerce.—The total value of the general commerce in 1893 was 10,148,000 francs for imports and 7,515,000 francs for exports, divided among different countries as follows:

COUNTRIES.	Imports.	Exports.
Belgium	4,482,000	2,182,000
Netherlands	1,200,000	1,784,000
Great Britain	2,020,000	582,000
Germany	1,010,000	184,000
French Congo	7,000	1,245,000
Portuguese possessions	177,000	567,000
Other countries	809,000	12,000
Total	10,148,000	7,515,000

The principal exports were: Ivory, 2,003,820 francs; caoutchouc, 1,849,506 francs; nuts, 840,064 francs; palm oil, 569,628 francs; coffee, 309,786 francs.

The special imports were 9,175,000 francs, and the exports of the produce of the State were 6,206,000 francs in value. The exports now consist of natural products, such as rubber, palm oil, palm nuts, and ivory. This last, constituting more than half of the total trade, is bound to decrease rapidly. The only cultivated products are rice and maize, the exports of which are insignificant. There is a vast territory suited for the growth of coffee, sugar, tobacco, and probably cotton, as well as rice and maize, and for the rearing of cattle; but the natives have

not been trained to labor, and means of transportation are still lacking. In certain parts of the Free State there are large supplies of copper, iron, and other minerals, including coal and gold. The export trade has steadily grown from 1,633,000 francs in 1887 to its present dimensions. The importations of textiles and other manufactures have increased with like rapidity, and Belgium's share, originally small, now greatly preponderates.

The number of vessels that visited the ports of Boma and Banana during 1893 was 677, of 217,906 tons.

The Congo Railroad.—Of the railroad that is to connect the head of navigation on the lower Congo with Stanley Pool 50 miles of the 250 were in operation at the close of 1894.

Proposed Belgian Annexation.—The King of the Belgians gave 40,000,000 francs for the original establishment of the Congo State and has since contributed 1,000,000 francs or more a year out of his private resources. He is no longer in a position to continue these sacrifices, and the Free State is also financially embarrassed, having incurred heavy expenses in fighting the Arab slave-raiders, and borrowed large sums of money, the interest on which weighs heavily upon its budget. For some years King Leopold has been anxious to transfer the responsibilities that he could no longer sustain to the Belgian Government. The needs were too urgent to wait for the arrangement for annexation in 1900 to be carried out. In 1894 the Government of the Independent State entered into negotiations with a syndicate of English capitalists, headed by Col. North, which proposed to buy a monopoly of commerce and exploitation in the great and rich province of Manyema. The Belgian Government interposed the objection, after the Manyema Association had been organized, that the proposed concession might prove a serious difficulty in the event of Belgium's taking over the Congo territories. Having blocked this way of relief, the Belgian ministry was constrained to take up the question of immediate annexation. A treaty of annexation was concluded between the Congo State and Belgium on Jan. 9, 1895, by which King Leopold ceded to Belgium the sovereignty of the Congo State, with all the rights and obligations appertaining thereto, the natural resources and acquired property, including the founders' shares in the railroad, and Belgium accepted the cession, and with it the debts and engagements. As a provisional arrangement pending the consideration of the bill for annexation, which was to be submitted to the Belgian Chamber within three months, it was agreed that no outlay should be made without the assent of the Belgian Minister of Finance, and that if the normal receipts of the Congo State fell below the expenses the King should supply the deficit. The total receipts were estimated at 6,000,000 francs, including the annual subsidy of 1,000,000 francs continued by the King, 2,000,000 francs contributed by the Belgian treasury, and taxes, imports, and other colonial resources. When the annexation bill was introduced in the Belgian Parliament it was vehemently opposed by the Socialists and Progressists and dubiously received or openly condemned by a section of the Right. On May 22 the Government suddenly

decided to adjourn the debate indefinitely. M. de Mérode, who was responsible for the French treaty that was made in view of immediate annexation, resigned his post as Belgian Minister of Foreign Affairs. Arrangements were made with M. de Browne de Tiège, an Antwerp banker, who had advanced 5,000,000 francs to the Congo State, whereby the payment of the loan was deferred and the tract of land mortgaged, for the loan remained in the possession of the Congo State. The unexpected withdrawal of the bill, indefinitely postponing annexation after three months of agitated discussion, was attributed to the King, who had found the opposition stronger than was anticipated, and would not be a party to saddling Belgium with so momentous a responsibility by a majority of only six or seven votes. The Chamber subsequently authorized a loan of 5,287,415 francs out of the treasury to pay off the debt to M. de Browne, a further advance of 1,500,000 francs to cover the budgetary deficiency, and a subsidy of 10,000,000 francs to the Congo Railway Company. In April the company had borrowed 5,000,000 francs from Belgian bankers, in addition to 2,500,000 francs advanced by them in the previous September. These advances were to be repaid out of the subsidy. With the 10,000,000 francs the company expected to carry the line 95 kilometres beyond Lufu, the terminus, in November, 1894, when the length constructed was 80 kilometres. The promise of the Belgian Government to furnish this sum was accompanied with the reservation of a right to purchase the railroad within five years. By June, 1895, the line was laid for 102 kilometres, and it was calculated that Kinpessé, 160 kilometres from Matadi, would be reached in May, 1896.

Franco-Belgian Agreement.—After the signing of the treaty of Jan. 9 the French Government made reservations as to the right of pre-emption of the same nature as the reservations that M. Ribot insisted upon in 1890, which induced active negotiations that had no definite outcome. The right of pre-emption claimed by France was first formulated in a letter of Col. Strauch, President of the International Association of the Congo, dated April 23, 1884, and Jules Ferry's reply. On May 31, 1884, M. Ferry, the French Minister of Foreign Affairs, notified the powers of this agreement in a circular letter. After the Independent State of the Congo succeeded to the possessions of the Congo Association there was an exchange of views in April, 1887, in regard to the character of the agreement. When King Leopold entered into the convention of 1890 looking to Belgian annexation of the Congo M. Ribot, then French Minister of Foreign Affairs, called for an explanation acknowledging that the Congo State would not be able to cede its possessions to Belgium without imposing upon the latter the obligation to recognize France's right of pre-emption. After M. Bourée, French minister in Brussels, had renewed the reservations of his Government, M. d'Anethan, the Belgian minister in Paris, wrote on Jan. 13, 1895, that the obligations of the International Association had passed to the Congo State, and in passing to Belgium would acquire still further guarantees.

On Feb. 5, 1895, a treaty was signed at Paris

by Baron d'Anethan and M. Hanotaux. In the first article the Belgian Government recognizes that France has a right of pre-emption over its possessions on the Congo in case of their alienation, by sale or exchange, in whole or in part; previous to any exchange of territory or placing of territories in the hands of a foreign state or a foreign company invested with rights of sovereignty preliminary negotiation with the Government of the French Republic must take place. In the second article the Belgian Government declares that there shall never be gratuitous cession of any territory. The third article explains that these arrangements apply to the whole of the territories of the Belgian Congo. Added to the text of this agreement is a declaration defining the boundary line in Stanley Pool, which is the median line except at the island of Banu, which shall belong to France, on condition that no military establishment shall be created there.

Expansion of the State.—The rout of the Arabs gave free scope to the Congo State to extend its influence to its remotest frontiers. Not only have the Arab rulers in the Manyema country been overthrown, but the slave-traders on the northern frontier and throughout the Welle districts have been driven out. Katanga also has been occupied. The native populations have improved in their manners at a rapid rate wherever the rule of the Free State has been established, and in return for the benefits of civilization and commerce they are being gradually brought to participate in the costs of civilized rule by the establishment of taxes and the formation of military contingents. By creating a native militia the State can save the heavy expense of maintaining a mercenary soldiery enlisted in West Africa. The camps of Kassongo and Douanga have been fortified and garrisoned with trained native soldiers at small expense. The same material is used largely in the defensive occupation of the northeastern provinces, which was deemed necessary in view of the incursions of the Mahdists. Late in 1894 the fortified post of Mundu, commanded by Capt. de Langhe, was attacked by 4,000 Mahdists and their auxiliaries, but it was successfully defended and the assailants were repeatedly repelled by the small disciplined force, and finally routed and driven from their camp at Egaru, although some had the newest rifles. Capt. Christiaens was killed. The Congo officials have made allies of the strongest sultans in the Welle district, who must now depend upon the Congo State alone to obtain arms to defend themselves against marauding bands from the north. In the spring of 1895 the Mahdists attacked another post in the Akka district, and in a desperate fight killed Lieut. Cassart and 19 men. The authority of the Congo State, however, was so firmly established that only isolated posts were in danger. Charles Stokes, a British trader who was once a missionary, for a long time supplied the rebels against the authority of the Congo State and all the slave-raiders of the upper Congo with arms and ammunition, in which traffic he amassed great wealth. Commandant Lothaire, arriving unexpectedly at Kilunga, in the region of the upper Congo, found arms that Stokes had brought and a letter to the chief Kibange, in which the trader announced that he would come to aid in

repelling the Belgian forces. He fled before the place was captured, but was overtaken and brought back, tried by court-martial and hanged. The British Government, though not inclined to question the justice of the sentence or the quality and abundance of the evidence, made representations on the assumption that he ought to have been taken to Boma and tried in the civil courts. The attitude of the British Government was not cordial after the cancelling of the main provisions of the Anglo-Congo treaty of May 7, 1894, out of consideration for the protests of France, and it became less so when the French right of pre-emption, the validity of which had been persistently denied by English statesmen, was embodied in a formal treaty.

CONGREGATIONALISTS. Statistics of American Congregationalists. — The "Congregational Yearbook" for 1895 gives the following summaries of the statistics of the Congregational churches in the United States: Number of churches, 5,842; of ministers, 5,287; of members, 383,532; of additions during the year on confession of faith, 38,853; of baptisms during the year, 17,705 of adults and 12,500 of infants; of families, 405,821; of Young People's Societies of Christian Endeavor, 3,640, with 304,083 members; of members of Sunday schools, 677,665; average attendance on Sunday schools, 420,603. Amount of contributions returned by 4,549 churches: For foreign missions, \$374,627; for education, \$253,758; for church building, \$94,566; for home missions, \$584,027; for the American Missionary Association, \$145,643; for Sunday schools, \$56,154; for ministerial aid, \$26,769; other benevolent contributions, \$674,767; making a total of such, \$2,190,111. Amount given in legacies, \$749,517. Amount contributed for home expenditures by 4,579 churches, \$7,035,307. Benevolent contributions of Sunday schools, \$132,341. Of the churches, 4,067 are returned as "supplied" and 1,275 as "vacant"; of the pastors, 3,480 as engaged in regular pastoral work and 1,807 as without charge. The tables of "fifth-year statistics" give lists of 4,417 houses of worship, having a total valuation of \$43,436,243; 2,032 parsonages, valued at \$4,380,239; 1,022 local invested funds, amounting to \$1,881,750; and 3,392 churches, paying an aggregate of \$4,041,727 for pastors' salaries; average salary of the pastors \$1,125.

Societies. — The Congregational Education Society received in 1894, including a balance of \$5,103 from the previous year, \$179,727, and expended \$178,807. It aided, in the student department, about 330 regular beneficiaries, besides about 50 of foreign birth, who were preparing to be home missionaries to their own people in the United States; in the college and academy department, 8 colleges and 6 academies; and in the "New West" department, the Salt Lake College in Utah, a training school at El Paso, 5 academies, and 9 mission schools, in the amount of \$20,000. The Slavic department of Oberlin Seminary, which has been receiving \$3,000 annually from the society, has furnished 15 graduates, who are now pastors and missionaries.

The American Congregational Association returns the value of its Congregational House as \$501,000. Its present debt is \$146,000. The

debt was reduced during the year by \$7,000. The whole number of volumes in its library is: Books, 33,648; pamphlets, 59,153; periodicals (not including unbound newspapers), 40,227.

The year's contributions to the Congregational Sunday School and Publishing Society, as recorded in the "Congregational Yearbook" for 1895, were 52,288, while its available income from all sources was \$72,502. It aided in 1894 in the organization of 478 Sunday schools, while during the same year 73 Congregational churches grew out of the schools organized by its missionaries.

The 7 theological seminaries (Andover, Bangor, Chicago, Hartford, Oberlin, Pacific, and Yale) returned for the year 1894-'95 58 professors, 27 instructors and lecturers, 23 resident licentiates or fellows, 16 members of the advanced or graduate class, and 459 undergraduate students.

Home Missionary Society. — The sixty-ninth annual meeting of the Congregational Home Missionary Society was held in Saratoga, N. Y., June 4 to 6. Gen. O. O. Howard presided. The financial statement showed that the society had begun the year with a debt of \$87,607. The receipts from the ordinary sources had been \$402,756, while the auxiliaries had raised and expended on their own account \$234,942. The total resources for the work of the society (including the cash on hand at the beginning of the year) were \$645,911. The expenditures, by the society itself and by the auxiliaries in their several fields, and including \$11,070 cash in hand for drafts payable at the end of the year, had been \$690,064. The fiscal year was closed with a net indebtedness of \$132,140. Eleven hundred and ninety-seven home missionaries had been employed in 45 States and Territories. Of these, 484 had been in New England, 154 in the Middle States, 106 in the Southern States, 114 in the Southwestern States, 971 in the Western States and Territories, and 195 on the Pacific coast; 997 had been pastors or stated supplies of single congregations, while 617 had ministered to two or three congregations each, and 411 had extended their labors over still wider fields. The total number of churches and stations regularly supplied by them was 4,104, besides many supplied at intervals. The number who had preached in foreign languages was 227 — 51 to Germans, 111 to Scandinavians, 27 to Bohemians, 6 to Poles, 15 to French, 1 to Mexicans, 3 to Italians, 2 to Spaniards, 2 to Flans, 3 to Danes, 3 to Armenians, 2 to Jews, and 1 to Greeks. The additions to the churches, so far as could be ascertained, had been 13,040, of whom 8,003 were on confession of faith; 116 churches had been organized and 34 had come to entire self-support; 68 houses of worship had been completed and 160 largely repaired or improved.

The thirteenth annual meeting of the Woman's Department was held at the same time with the meeting of the general society. The secretary reported a loss of more than \$1,500 in the year's receipts for the whole work. The gifts in cash had been \$57,674; besides which boxes and packages had been received and sent out to the estimated value of \$72,832. A paper on "Open Doors," read by Secretary Washington Choate,

invited attention to the opportunities for missionary work in Utah, New Mexico, Arizona, southern California, and Texas. A special paper was read by Secretary J. B. Clark on the financial condition of the society. A plan was adopted for raising a sufficient amount to pay the debt of the society by 1,400 subscriptions of \$100 each; and several subscriptions were made upon it.

Church Building Society.—The forty-second annual meeting of the Congregational Church Building Society was held in New York Jan. 10. The treasurer reported an increase both in the receipts and in the number of contributing churches. The receipts were \$155,138, or \$8,086 more than those of the previous year, and the number of contributing churches was 2,378, or 240 more than in any previous year. Aid had been given toward the completion of 54 parsonages, in which, by means of loans of \$21,750, property valued at \$62,115 had been brought into use; and 103 houses of worship, in which \$339,722 of church property had been secured by advancing \$70,758. The average cost, including lots, of the parsonages was about \$1,150, and the average parsonage loan about \$403. The average cost of the churches completed was \$3,298, and the average aid \$694. Of the churches aided, 8 had been given loans only, 21 loans and grants, and 82 grants only.

American Missionary Association.—The forty-ninth annual meeting of the American Missionary Association was held at Detroit, Mich., in October. The receipts for the year had been \$307,547, and the expenditures \$337,334. The deficit, \$29,787, added to the debt, \$66,301, brought over from the previous year made the present indebtedness of the society \$96,088. In addition to the ordinary receipts, the association had received, as income from the Daniel Hand fund, the sum of \$45,275 and endowment funds to the amount of \$4,810, which made its total income \$357,632. Notwithstanding the large debt, the present rate of annual expenditure was \$50,000 less than it had been three years previously. Some of the schools and missions had been closed, and those which remained were suffering in efficiency and power and in the compass of their work. The following statistics were presented of the educational and missionary work of the society: Educational work South—higher institutions, 6; normal and graded schools, 39; common schools, 29; instructors, 405; pupils, 11,981. Church work South—churches, 198; missionaries, 138; members, 10,476; added during the year, 1,346; Sunday-school scholars, 12,715. Mountain work (included above)—churches, 51; members, 4,521; schools, 17; pupils, 2,084; teachers and missionaries, 62; ministers, 22. Work among the Indians—churches, 14; members, 905; schools, 21; missionaries and teachers, 80; pupils, 578; Sunday-school scholars, 1,400. Work among the Chinese—schools, 20; teachers, 36; pupils, 1,011; number of Christian Chinese, 300; professing faith in Christ during the year, 40. General summary—schools, 117; pupils, 13,732; missionaries, 649; churches, 212; church members, 11,381; Sunday-school scholars, 15,289. Forty-two new churches, with more than 1,000 members, had been organized in the South and West. The

out stations connected with the work among the Indians—which usually represent a house occupied by a Christian Indian and his wife, and a school and a church, or, perhaps, a circuit of churches—are situated in 5 different States, and reach probably not far from 20 tribes. Twenty missionaries occupied these out stations, and, it was estimated, came in contact with about 50,000 Indians every year. A new mission had been opened during the year, by the aid of funds contributed especially for that purpose, among the Crow Indians. Missionary work had been resumed among the Eskimos in Alaska, with manifestations of considerable religious interest among the people, and an enrollment of 142 and an average attendance of 108 in the schools. The whole number of additions during the year to the membership of the churches in the South and West was 1,425. An increase of churches and of members had taken place during the year in the "mountain work," or the work among the people of the mountain region of the Southern States. Of the pupils in the schools in the South, 91 were classed as theological, 63 as collegiate, 198 as collegiate preparatory, 1,376 as normal students, 2,621 as grammar-school pupils, 3,170 as intermediate, and 4,552 as preparatory.

In the industrial departments of the schools are taught shoemaking, carpentry, printing, tinning, cabinetmaking, wagon making, blacksmithing, sewing, cutting, nursing, and other like arts. One normal school in the South, that at Orange Park, Fla., is especially mentioned in the report as having been "made an object of determined attack by the State Superintendent of Public Instruction, who has influenced the enactment of laws which make it a criminal offense not only to allow a white student in the same school, but also for a white teacher to be boarded under the same roof with colored pupils. The law is so vicious in intent, and so significant in its purpose, that, after legal opinions of eminent counsel, our committee have found no other way but to test its validity; not in a spirit of disobedience to law, but with a determination to have the deliverance of the highest possible authority upon a law which we consider unchristian."

American Board.—The eighty-sixth annual meeting of the American Board of Commissioners for Foreign Missions was held in Brooklyn, N. Y., Oct. 15 to 18. The treasurer's report showed that the total receipts for the year had been \$716,837, or \$11,704 more than in the previous year. Among the details of the receipts, a gain of \$38,222 was returned in the regular contributions from churches and individuals, a decrease of \$14,628 in special gifts, and a decrease of \$33,333 in legacies, the whole amount received from this source being the smallest sum derived from it, with one exception, in five years. Other items in the receipts were \$9,031 from interest, \$41,367 from the legacy of Asa Otis, and \$47,071 received for the debt. The expenditures had been \$715,232. The debt, which amounted to \$116,237 at the beginning of the year, had been reduced to \$114,632. The foreign missionary work comprised, in 20 fields in Europe, Asia, Africa, and Oceania, 103 stations, 1,163 out stations, 1,461 places for stated preach-

ing, with average congregations of 72,000 persons. In these stations were employed 187 ordained missionaries, 16 of whom were physicians, 24 unordained physicians (including 11 women), 5 male assistants, 267 women (including the 11 physicians)—making the whole number of laborers from the United States 572—242 native pastors, 500 native preachers and catechists, 1,734 native school-teachers, and 613 other native laborers. The whole number of native laborers was 3,107, and the whole number of American and native laborers 3,679. The 461 churches returned 44,413 church members, of whom 3,266 had been added during the year; and the whole number of church members from the beginning, as nearly as could be learned, was 161,914. The educational department returned 16 theological seminaries and station classes, 64 colleges and high schools, 60 boarding schools for girls, and 1,025 common schools, with, in all, 53,615 persons under instruction. Of these, 265 were in the theological schools and station classes and 4,174 in the colleges and high schools.

The condition of the finances was the most important subject claiming the attention of the meeting. As with most of the other missionary societies, the contributions had greatly fallen off during the past few years, and the board had been able to sustain its work without contraction only by drawing upon two large special funds which had been bequeathed to it. These funds were now exhausted, or nearly so, and the question had to be faced of how to carry on the widely extended missionary work without diminution. Co-operating committees, representing different parts of the country, appointed in the previous year to assist in securing increased contributions, had brought in reports that were called encouraging, but could not make sure that the required total of income would be obtained. In a paper on "The Next Step" Secretary Judson Smith insisted that there should be no reduction, and the meeting unanimously resolved

That every member of every Congregational church and every friend of the board in the land engage in continuous prayer for the board and its work and for the personal guidance of the Holy Spirit in determining the duty of individual benefactors.

That the condition of the heathen world be renewably presented by every pastor to every congregation and the obligation of Christians to rescue the perishing; that the spiritual destitution of the world become a burden on the hearts of Christian people; that pastors recommence themselves to missionary endeavor.

That every Church be constrained to make a contribution according to its means, and that plans be adopted by each to secure an individual gift from every member.

That, while every effort be made to reduce (remove, if possible) the debt and diminish the expenses, no field be abandoned, and that the necessary financial burden be carried another year with constant prayer to God for speedy relief.

That we seek, through co-operating committees and by every possible agency, for large gifts from persons sons and daughters of God as well as the regular receipts and replace the nearly consumed Otis and Sweet legacies.

That applicants for service be encouraged to hope that soon their claims may be gratified, that none be turned away from this chosen service, but in tempo-

rary trials at home hold themselves in readiness for the call to duty on foreign fields.

The work of the co-operating committees was approved, and they were reappointed. Further resolutions were unanimously adopted:

That the expenditure of the Otis legacy to be completed in a few months, leaving the responsibility of the missions which have been aided from this source resting directly upon the treasury; that the pressing needs of all the existing missions, hampered as they have been and well-nigh crippled by the enforced retrenchments and the refused appropriations of the last two years; that the number of gifted and devoted young men and women waiting and asking for missionary appointments; that the perils of the time, calling upon the board and its friends to present a resolute and undaunted front to the difficulties and antagonisms it encounters—that those and other facts demand of the pastors and the churches a far more united and generous response to the calls of the board's officers and of the co-operating committees than has yet been obtained.

That the Presidential Committee, in making the appropriations and expending the resources committed to our hands, is not to be held responsible for disastrous results which may result from the inefficiency of those expenditures, and that it be instructed, just so far as is practicable, to restrict its operations within the means of the means furnished it. For all limitations or sufferings thus occasioned, the churches must answer, which, with the knowledge of the need and the opportunities, and with the needed resources in hand, fail to respond to the call of the Master of their fallen race, and of the board's representatives they have sent into the field.

A special committee was appointed to endeavor to secure from individual friends of the board, but without interfering with the co-operating committees and the regular agencies, subscriptions, payable in March, 1896, estimated on \$115,000, the approximate amount of the debt, being obtained.

Woman's Board.—The twenty-eighth annual meeting of the Woman's Board of Missions was held in Boston, Mass., Nov. 6. The report was for nine and one half months. The receipts from contributions and legacies had been \$107,147, while other items made the total receipts from Jan. 1 to Oct. 15, \$115,890. The board had under its care in different fields 130 missionaries, 10 assistant missionaries, 53 girls' boarding schools, 266 day schools in whole or in part, and 157 Bible women. The Island Home for blind girls, at Amanzimtoti, Zululand, afforded shelter to many fugitives, and 197 girls had become members of the school. More than 2,000 girls attended the village day schools in Batticaloa, Ceylon. At the girls' school in Ootacaville, Ceylon, was organized, in 1885, the first Christian Endeavor Society in Eastern India. There are also in the churches Junior Endeavor Societies, a Young Men's Christian Association, and Helping Hand Societies, in which low-caste, poor women are taught to sew and to read the Bible. The reports of missions in European and Asiatic Turkey and of the Marathi Mission in India summarized the work of 56 missionaries. The American College for Girls, in Constantinople, had given instruction during its 25th academic year to 161 students, of whom 88 were Armenians, 19 Greeks, and 18 Bulgarians, the remaining 36 being divided among 7 different nationalities. Eighty-eight were boarders,

47 were in the college proper, and 114 in the preparatory department.

Triennial National Council.—The Congregational Triennial National Council met in Syracuse, N. Y., Oct. 10. The Hon. Nelson Dingley, ex-Governor of Maine, was chosen moderator. The statistical report presented by the secretary, the Rev. Dr. Hazen, showed that the membership of the Congregational churches had increased during the triennium by 58,442, a number larger by 9,000 than in the previous three years, or any three years of the record. The number added on confession of faith was 104,879; the number of infant baptisms, 34,392, almost 6,000 more than in the previous period; the gain in members of the Sunday schools, 51,900; and in members of young people's societies, 38,985, the whole number of Congregational members of these societies being 204,085. The whole number of churches added to the roll was 651, but the net gain of churches was only 356, or 119 a year. When the council met in Boston in 1865 it represented 2,745 churches, with 262,400 members in 23 States and Territories. It was now at home in every State except Delaware, and every Territory except Alaska, had added 2,597 churches to its roll, almost doubling their number, and had gained 320,890 in membership.

The gain of members was largest in the interior where it was 31,077, or 3,500 more than in the East and West combined. In this list Illinois stood first, with 6,994 of increase, and was followed by Michigan, Iowa, Massachusetts, California, and Ohio. Of the gain of churches, 155 were in the interior, 129 in the West, and 73 in the East. Alabama led in it with 55 of increase, and was followed by Oklahoma, Illinois, Michigan, and Wisconsin. The five States having more than 300 churches were Massachusetts, Michigan, Illinois, Connecticut, and Iowa. Massachusetts stood first in the number of members, 109,474, and was followed by Connecticut, 61,357, New York, Illinois, Ohio, and Iowa, each having more than 30,000 members.

The total of benevolent contributions reported for the three years was \$7,244,682. The average per member was \$12.89, or \$4.22 per annum. The influence of the financial situation appeared in the contrast of the small gain of \$124,609 with that of \$1,138,806 during the preceding triennium. The decrease had come into view only during the past two years. The fifth-year statistics showed that the 5,342 churches had 4,417 houses of worship, valued at \$43,446,243, or an average of \$9,792; that 2,032 of the churches had parsonages, valued at \$4,580,239; that 1,022 of the churches had invested funds to the amount of \$3,881,750, and 1,562 churches had debts amounting to \$3,300,796; or, in other words, the invested funds would pay all the debts and leave \$381,000 surplus. A gain of \$55,961 was reported in assets held by the trustees of the council and the Committee on Ministerial Relief, chiefly from legacies. The Church Manual was reported to be completed, with full instructions for the organization and conduct of a church. The report of the committee on church unity included a review of a number of propositions which had been made with reference to that end, chiefly those of the bishops

of the Protestant Episcopal Church, of the Disciples of Christ, of the Christian Connection, and the "New Jersey Declaration" of Congregationalists. The proposition of the bishops, embodying the "four points" of the "Lambeth articles," had failed to be accepted by other denominations on account of the impossibility of agreeing upon the interpretation to be given to "the historic episcopate." A proposal made by the Disciples of Christ was dismissed as impracticable, because it insisted on the baptism of penitent believers by immersion only. It was pointed out that the first steps toward union could best be taken between denominations which were governed by the same polity. The previous National Council had said "that affiliation with our denomination of churches not now upon our roll should be welcomed upon the basis of the common evangelical faith, substantial Congregational polity, and free communion of Christians, without regard to forms or minor differences."

That resolution opened the way fully for fellowship with any Church or Churches that prefer to practice baptism by immersion and only on confession of faith in Christ. It had removed one stumbling-block in the way of union with the Free Baptists. In their case, however, an unsuccessful negotiation for union in Michigan with the regular Baptists had, with other things, made it seem untimely to press the subject at present. There was, however, believed to be a growing sentiment among the Free Baptists in favor of closer union with other bodies, either Baptist or Congregationalist. A more satisfactory correspondence had been had with the Christian Connection, the history of which brought to consideration what was known as the "New Jersey Declaration," concerning which the report continued:

It proposes organic union with the Free Baptists and the Christian Connection, on the basis of the same general faith in the Scriptures, interpreted with Christian liberty. It declares that no change is asked in their customs or faith. It desires that they shall "maintain their teaching as to the manner and subjects of baptism," and it declares that "we are under bondage to no creed, Lutheran, Calvinistic or Arminian, and that our only authority is found in the Holy Scriptures. It does not ask that they "should sink their names or give up their loved organizations or vested interests," and it professes a desire to "accept any terms which they in the exercise of their conscientious rights and their Christian affection could ask," and on such terms it invites correspondence with them. The Declaration concludes with a proposition of a proposed basis of union [for which see the action of the Council following the presentation of the report]:

This paper was sent to the various Congregational State bodies, and has been approved by the Associations or Conferences of Pennsylvania, Michigan, Ohio, Illinois, Indiana, Kansas, Minnesota, Washington, and perhaps of other States.

In accordance with the purpose of this paper, the committee whose names are signed to it were represented at the New Jersey State Convention of the Christian Connection, which body passed very cordial resolutions, recommending further action by their National Convention, which was to meet in Haverhill, Mass., in October, 1894. Your committee were represented at that convention by two of their number, and were most cordially received. Two days were devoted to the discussion of union with

the Congregationalists, and action was finally taken unanimously, recommending "a co-operative union between the Christians and the Congregationalists of any other denomination seeking such union," such union to recognize the parity of the co-operating bodies, and not to be based on doctrinal tests, such co-operative union not to interfere with institutions, churches, conferences, etc., at present organized, but to be concerned with mutual recognition and common service for Christ's kingdom. It was also provided that a commission of 12 members should be formed to act with similar commissions of any other bodies, a two-thirds majority of whom should be assumed to represent the Christian Convention, unless their action is vetoed by the Quadrennial Convention. Such a representative Commission was appointed. It was also voted that "the ultimate ideal of Christian union is the union of all the followers of Christ in one body, in an organic union, inspired with the spirit of the Master, existing and acting with single reference to carrying on his work, building up the kingdom, and bringing the world to Christ; and we would encourage and co-operate with any and all measures looking to this end."

While the Christian body seemed disposed to go slowly in the matter of union, so that there might be no union without general agreement and the fullest concurrence, it was evident that a genuine desire for actual union existed among its members. Their proposal of a co-operative union was for the present purpose, but was regarded as by no means reaching their ideal of ultimate organic union.

The Council resolved

That it be the duty of the Committee on Union with Other Denominations in cases where it may seem wise to this committee to attempt specific union with any particular denomination to conduct negotiations with such denomination by means of persons whom it shall select for such purpose.

That, in particular, this committee be directed to act in conference with the commission appointed by the Christian Quadrennial Convention, with a view to closer co-operative union and, if it seem feasible, organic union. We suggest also particularly that the committee continue the communications with the Free Baptists which have been hitherto in progress.

The Committee on Union with Other Denominations shall be understood to act upon the following basis:

(1) In accordance with the constitution and organic declaration of this National Council, adopted at Oberlin in 1871, declaring the Holy Scriptures "the sufficient and only infallible rule of religious faith and practice, their interpretation thereof being in substantial accordance with the great doctrines of Christian faith commonly called evangelical," and that "the liberty of our churches" affords "the ground and hope of a more visible unity in time to come," we, as Congregational churches, recognize no creed of human origin, no matter how venerable or historically honored by us and by the Christian Church, to have authority over our faith, which authority belongs only to the Word of God.

(2) In any union contemplated those who join together have, accordingly, the right to maintain their conscientious varieties of faith and order.

(3) And, whereas the visible union of Christians is an object greatly to be desired, and whereas it is our duty to do what we can to secure it, and whereas such union can not be secured by the subordination of any, but only by the liberty of all, under Jesus Christ, we do approve, as a proposed basis of such union, the platform of union suggested by the New Jersey Association and approved by a number of our other State bodies, and we direct the Committee on Union with Other Denominations to present it in the following slightly amended form to our sister denom-

inations of evangelical Christians for their consideration:

We propose to other Protestant Evangelical Churches a union, or alliance, based on

1. The acceptance of the Scriptures of the Old and New Testaments inspired by the Holy Ghost as containing all things necessary to salvation, and as being the rule and ultimate standard of Christian faith.

2. Discipleship of Jesus Christ, the divine Lord and Saviour and the Teacher of the world.

3. The Church of Christ, which is his body, where great mission it is to preach his Gospel to the world.

4. Liberty of conscience in the interpretation of the Scriptures and in the administration of the Church.

Such an alliance of the Churches should have regular meetings of their representatives, and should have for its objects, among others:

1. Mutual acquaintance and fellowship.

2. Co-operation in foreign and domestic missions.

3. The prevention of rivalries between competing Churches in the same field.

4. The ultimate visible union of the whole body of Christ.

And whereas it can not be expected that there shall be a speedy corporate union of the numerous bodies into which the Christian Church of our own land is divided, we do therefore deem that their growing spiritual unity should be made manifest by some form of federation which shall express to the world their common purpose and confession of faith in Jesus Christ, and which shall have for its object to make visible their fellowship, to remove misunderstandings, and to aid their consultations in establishing the Kingdom of God in the world; and to this end we invite correspondence with other Christian bodies.

That we recommend our brethren who have sought to promote unity of interdenominational organizations in the several States, and request the Committee on Denominational Unity to arrange similar movements in all parts of our land.

When it shall seem proper that a conference of the various denominations be sought, either for unity or for closer union, this shall be provided for by the joint action of the two committees, each consenting thereto.

During the deliberations on these measures the Council was addressed by the Rev. J. R. Weston, D. D., chairman of the Committee on Union of the Christian Quadrennial Convention, explaining the position of that body, and expressing its desire for a closer fellowship. In the case of the Alabama State Convention, which the Council had hitherto declined to recognize, because including only white churches, it was not organized as representing all the Congregational churches of the State, the Council found that it had modified its constitution, "adopting the principle of the Council of 1882 of 'equal rights for all Disciples of Christ of every race,'" and had invited the Congregational Association of Alabama (colored) to unite with it on that basis, which invitation—although the two bodies had once sat as one—had not yet been finally accepted. Present recognition was given to the General Convention of Alabama pending further action upon the recommendation of the Council that negotiations for union with the churches of the Alabama Association be resumed, and that both parties, in the spirit of mutual concession, earnestly endeavor to bring all the Congregational churches of the State into one fraternal organization." The following resolution, with reference to re-

cent legislation in Florida, was adopted by a unanimous rising vote:

Whereas, The State of Florida in a recent enactment has made it a criminal offense for our missionary teachers to instruct in schools, white and colored pupils without caste distinctions; and for any person to patronize such schools; and

Whereas, The State Superintendent of Education has given public notice that he will subject the teachers of the American Missionary Association to criminal prosecution in case they live in the same building with their pupils or teach white and colored pupils without distinction of caste:

Therefore, The National Council of Congregational Churches of the United States, regarding the enactment not only as repugnant to Christian principle, but also as opposed to our civil rights guaranteed by the Constitution of the United States to all citizens, do call upon our representative, the American Missionary Association, to unceasingly and courageously resist this wicked enactment in all lawful ways, and to exhaust all legal measures to defend these guaranteed rights and privileges, and to carry if necessary this case to the Supreme Court of the United States, for adjudication, and we pledge to the association in pursuance of this our hearty co-operation.

A rule laid down by the Council nine years before for the preservation of a high standard of character and education in the ministry was reaffirmed. Resolutions in reference to the "Armenian atrocities" and outrages on missionaries in China, besides expressions of condemnation, contained a call on the United States Government more thoroughly to protect the lives and interests of its citizens abroad.

British Congregationalists.—The returns of the British Congregational churches, officially furnished to the "Yearbook" for 1895, show that there were in England and Wales in 1894 4,562 Congregational places of worship, with accommodation for 1,613,722 persons, an increase for the year of 43,701 sittings. In Scotland there were 99 churches, and in Ireland 27, with 96 evangelistic stations. In the British colonies there were 818 churches, an increase of 11. In the district covered by the London Congregational Union there were 375 churches, with accommodations for 218,467 persons. No returns as to church membership are furnished by the associations, but there were 2,804 ministers in England and Wales, 112 in Scotland, 27 in Ireland, and 430 in the colonies. Twenty-six new churches were formed during the year, including 10 in the colonies, and 44 new chapels were opened, 29 enlarged, and 10 closed.

Congregational Union of England and Wales.—The sixty-third Annual Assembly of the Congregational Union of England and Wales was held in London, beginning May 6. The Rev. U. R. Thomas, of Bristol, presided. The report of the committee contained a revision (the fourth) of the constitution, in which provision was made for the enlargement of the privileges of membership, giving the committees a more open constitution; substituting a division of England into 8 representative districts for the present division into 4; and proposing the institution of 2 or even more autumnal meetings of the Union. The revision was submitted, with the suggestion that consideration of it be deferred. This was done. The belief was expressed in the report on secondary education that the report of the royal com-

mission would lead to a great extension of secondary education, which would do much to free it from the denominational bias and taint. A resolution concerning the "atrocities" in Armenia called on the Government to continue its remonstrances with the Sublime Porte until the administration of the Armenian provinces has been thoroughly reformed. A resolution was unanimously adopted in favor of the local option bill (relative to the sale of intoxicating liquors). A special committee was appointed in view of the recent letter of the Pope, to prepare an address to the Congregational churches on the subjects of sacramentalism, ecclesiasticism, and reunion. The subject of the duty of the Congregational churches to promote progressive work, especially in large towns, having been introduced and discussed, the committee was authorized to prepare a scheme for church extension in such towns. A resolution of sympathy with Madagascar stated that "the assembly can only contemplate with pain the course by which not only the peace but the national independence of Madagascar have been put in imminent peril. The assembly desired to express its affectionate sympathy with the Malagasy churches in the trial through which they were passing, and earnestly prayed that the lives and liberties of the people might yet be spared." Copies of the resolution were ordered sent to the Minister for Foreign Affairs and to the writers of the recent appeal from Madagascar addressed to the secretary of the London Missionary Society. The subjects, relating to missions, were discussed during the meetings of "Modern Theology in Relation to Christian Missions," "Change of Methods in Missionary Work," and "The Development of the Resources of Our Churches for Missionary Purposes." A course of lectures on various aspects of missions was announced for the next winter.

The autumnal assembly of the Union was held at Brighton, beginning Sept. 30. The Rev. U. R. Thomas presided, and delivered an opening address on "Catholicity and Congregationalism." He said catholicity was indigenous to true Congregationalism. There was little danger of any earnest effort for the reunion of Christendom being ever disparaged from the chair of that Union. But when the pious opinions of the Pope of Rome, the tentative proposals of the Archbishop of Canterbury, and the renewed and reiterated discussions of the conferences at Grindelwald had pretty well succeeded in beating the word "reunion" on the drum of the Church's ear, he might be pardoned for suggesting that catholicity must precede reunion. It would be unspeakably better to have catholicity without reunion than reunion without catholicity. Catholicity was not catholicism that would monopolize the title Catholic, and the great party in another Church that appropriated the name were, and always had been, the chief hinderers, and the most formidable antagonists of catholicity. Resolutions were passed by the assembly, declaring its strenuous opposition to the proposals of the archbishops and the Roman Catholic committees to seek increased grants of public funds for schools under denominational management and for teachers whose appointment or dismissal would be vested in unrepresentative hands.

mentative bodies, regarding them as an attempt, under the guise of assistance to so-called voluntary schools, to create a fresh endowment of religious denominations by the state; and expressing its trust that all Congregationalists will present a united front in resisting such proposals, and will maintain the principle that schools supported by the people must be governed by the people. The appointment of a national committee was recommended, to include representative men of every denomination, whose duty it should be to resist any further endowment of sectarian schools, and to demand the extension of school boards throughout the country, providing unsectarian schools within reach of all the people. The protest of the assembly was renewed against the Turkish treatment of Armenia, and the Government was strenuously appealed to to provide efficient measures of relief, the appointment being suggested of a high commissioner for Armenia—not an official of the Turkish Empire, not even an Ottoman subject—who shall be pledged to protect the Christian population of the country, and who shall be solely responsible to, and sustained by the European powers. The loyalty of the assembly to the principle of religious equality was re-affirmed, and its pledge renewed to continued efforts to secure the application thereof to the three kingdoms. An encyclical letter was ordered prepared for pastors concerning the attitude they should assume and the duties they should attempt to fulfill in the face of the special theological and ecclesiastical questions and difficulties of the day. The Bechuana chiefs, Prince Khama, Sebele, and Bathven, were welcomed to the meeting; its sympathy was tendered them "in their effort to keep their people free from the evils of the drink traffic and to lead them into the life and liberty of Christ"; and hopes were expressed that the Government might "find some way to meet them in their desire to remain under the direct protectorate of the British Crown." Negotiations were carried on during the year with the Evangelical Union of Scotland for union with the Congregational churches, the consummation of which, it is confidently believed on both sides, will be effected in no very long time. Resolutions favoring union were adopted at a representative meeting of members of the Evangelical Union held in Glasgow in the spring; and at the annual meeting of this body in October measures were adopted looking to a completion of the negotiations for union and the carrying of them into effect. The Scottish Congregational Union in April voted to postpone the question of union for one year on condition of the opponents of the measure pledging themselves to accept whatever might be determined upon at the next annual meeting of the body.

London Missionary Society.—The business meeting of the London Missionary Society was held May 6. The financial report showed that the ordinary income had been less than the ordinary expenditure by £19,418, and that the balance accumulated against the society in two years amounted to £42,535. As such a debt would have absorbed more than all the remainder of the society's available resources, and would have made it impossible to carry on the

ordinary work, it had been decided to make this debt the first charge upon the Centenary fund. As the amount received up to the time of the meeting had reached £60,000 (£60,200), that amount had been wiped off, and the residue of the fund as it came in would be utilized for restoring the working capital or reserve fund of the society, and for providing a fund for the erection of buildings in the mission field. Under ordinary circumstances a considerable amount would have been expended in providing accommodation for missionaries, but the money was withheld, to the great risk and inconvenience of the society's agents, and injury to their work. It was estimated that to enable the society to maintain its present staff in the field an increase of income to the extent of £20,000 a year would be required. To close the history of a century remarkable for its unique efforts with an income so much less than the expenditure as to suggest the necessity for prompt contraction of the area of work was far from satisfactory. This, however, was the condition of the society.

It was represented at the meeting of the woman's association that since the association was founded, twenty years before, 103 women workers had gone out, and 69 were now actively engaged—33 in India, 21 in China, 6 in Madagascar, 2 in South Africa, and 4 in the South Sea, Samoa, and Raratonga. They had also many native workers and teachers. The London Missionary Society had the largest number of medical missionaries of any society, and the gifts to their society from natives of China were larger than to any other missionary association. The work of the missionaries included the care of hospitals and leper asylums having 431 beds, which in 1894 received 3,700 patients; the care of 31 dispensaries, which had treated 121,791 patients, not including return visits; and medical missionary tours from village to village. The women's work included the conduct of boarding schools, day schools, and orphanages for girls, with 56,000 enrolled pupils; the training and superintendence of native women helpers, 155 of whom were Bible women, supported by the Bible Society, and 535 teachers; and the zenana and house-to-house visitation. A successful part of the medical work in Madagascar—in which the Society of Friends co-operates—is the training of young men as doctors and of young women as midwives and nurses. Forty young women were in the hospital now undergoing such training. Similar work was done in China, where a woman's hospital was erected and maintained till her death, a year previously, by the wife of Li-Hung-Chang. Three hundred wounded soldiers from Port Arthur, after a month's travel overland, had been received into the Tientsin hospitals.

A convention organized to celebrate the centenary of the society was opened with a young people's meeting, Sept. 21. Of the progress made by the society during the century of its existence, the home secretary, Rev. A. N. Johnson, said that its present income was £180,000 a year, as compared with £11,000 at the beginning of the century; that £20,000 were raised yearly on its foreign stations; that it had sent out more than 1,000 missionaries during the past one hundred years, including such men as Muf-

fat and Livingstone; and that it had now 258 missionaries in different parts of the world. The Centenary fund which the society had undertaken to raise in commemoration of this event, to be applied to educational and other special purposes, had reached £76,160. Special reports were made concerning the condition of the missions and the people in Samoa, where, although life was still in many respects not in conformity with the requirements of the Gospel, many social reforms had been effected, and the community, as a whole, had been Christianized; the Hervey Islands, where there were 20 churches, with accompanying schools and homes for missionaries, 2,600 members in fellowship, and 1,950 pupils; New Guinea, where the work of conversion was advancing gradually; Madagascar, where, with 39 English missionaries and more than 1,000 native pastors, there were 1,406 churches or other buildings in which services were held connected with the society, in addition to numerous auxiliary agencies of a religious and educational nature, and adherents numbered by hundreds of thousands; India; South Africa, and China. Papers were read on "The Duty of the Missionary Society to the Children of Converts," "Schools as a Means of preparing the Way of the Lord," "The Need for Industrial Missions," "Openings for Christian Work among Students and Educated Men in India," and "Medical Work in Connection with Missionary Enterprise." A meeting was held for the discussion of woman's work in the mission field at which papers were read on the home life and position of women in heathen lands, the difficulties of missionary work in heathen homes, and the position and opportunity of the European woman missionary. A special committee reported, as the result of an examination of the whole of the society's expenses, home and foreign, that they had found no appreciable waste. Some criticisms of the methods of the missionaries having been made at the meeting of the British Association by Mr. W. M. Flinders Petrie and others, in which it was intimated that they interfered too much and unwisely with harmless native customs, the Rev. Dr. Bruce said they were actuated by a spirit of tenderness and gentleness toward anything that was at all simple or moral among the natives. There were, however, some practices that they were bound to speak against, and in doing so they were only following the footsteps of the Apostle Paul, who did not hesitate to disturb ancient customs wherever he found them opposed to righteousness. The Rev. J. Chalmers, from New Guinea, said he had personally baptized naked people. The Rev. S. J. Whitney, from Polynesia, had known only one missionary who insisted on the people wearing English clothes.

The meetings were participated in by three Christian African chiefs, and were attended as visiting delegates by representatives of twenty other missionary societies.

The committee of the English Congregational Union proposes to follow up the impression produced by the recent centenary of the London Missionary Society with a course of lectures on missionary themes, and a series of conferences and meetings for prayer.

Colonial Missionary Society.—The fifty-ninth report of the Colonial Missionary Society mentions a new departure which had been made in the direction of giving counsel and aid to native churches founded by the London Missionary Society. Arrangements had been made for visitations to the churches of Jamaica, British Guiana, Natal, and the Cape Colony. Payments and loans had been made to a number of colonial churches and aid offered to the West Australian churches and to churches in Canada and Newfoundland. The year's income was £2,539, an increase, and a balance of £529 was left.

Church Aid Society.—The Congregational Church Aid Society had assisted 958 churches, or 16 less than in the previous year, connected with which were 583 pastors and evangelists, an increase of 18, and 34,355 members, an increase of 1,266. The income of the society had been £28,452, or £829 more than in the previous year, and the expenditure £28,358, an increase of £937. The aided churches raised £76,263, or £17,910 less than in the previous year; and there had been paid in grants £23,487, an increase of £375.

Congregational Union of South Africa.—At the annual assembly of the Congregational Union of South Africa, held at Grahamstown, the recent legislation as affecting the native churches was unanimously condemned as unjust. Instead of establishing a separate institution for the training of a native ministry, it was decided to send the students to Lovedale and make a special contribution to the institution there, in addition to the regular charges. Measures were taken concerning the life assurance of ministers, and to promote the "forward movement."

The Congregational Churches in Madagascar.—Madagascar has been one of the most fruitful fields of the operations of the London Missionary Society. After many years of arduous labor, with twenty-six years of fierce persecution, a strong Church had been built up in the Hova kingdom, and Congregational Christianity had substantially become the religion of the nation. Much interest has been attached to the question of what would be the fate of this Church after the French conquest. The Rev. W. E. Cousins, missionary, was able to make a pleasant forecast at the meeting of the London Missionary Society for the future of the Madagascar Protestants. Through twenty-six years of persecution there, he said, the native Christians kept their churches alive, and that fact might assure them as to their future. These people were not to be lightly turned away from the religion they possessed; and the speaker still clung to the belief that even under a French protectorate they would be able to continue their Christian work. Full protection and complete toleration were guaranteed by the Anglo-French Convention, and they had the assurance of the highest French officials to the same effect. He believed the French would find it politic not to persecute the Protestants, who formed the most influential part of the population; and that the people of central Madagascar, who were practically all Christians, would carry the Gospel throughout the whole island. It would be necessary, however, to give more attention to the teaching of the French language. Nine tenths of the population of the whole island are still heathens.

CONGRESS. The third session of the Fifty-third Congress began Monday, Dec. 3, 1894. The President sent in his annual message as follows:

To the Congress of the United States:

The assemblies within the nation's legislative halls of those charged with the duty of making laws for the benefit of a generous and free people impressively suggest the exacting obligation and inalienable responsibility involved in their task. At the threshold of each labor now to be undertaken by the Congress of the United States, and in the discharge of an executive duty enjoined by the Constitution, I submit this communication, containing a brief statement of the condition of our national affairs, and recommending such legislation as seems to me necessary and expedient.

The history of our recent dealings with other nations, and our peaceful relations with them at this time, additionally demonstrate the advantage of consistently adhering to a firm but just foreign policy, free from envious or ambitious national schemes and characterized by entire honesty and sincerity.

During the past year, pursuant to a law of Congress, commissioners were appointed to the Antwerp Industrial Exposition. Through the participation of American exhibitors full fair docket of completely illustrating our national ingenuity and industrial achievements, yet it was quite creditable, in view of the brief time allowed for preparation.

I have endeavored to impress upon the Belgian Government the modifications and positive harmfulness of its restrictions upon the importation of certain of our food products, and have strongly urged that the rigid supervision and inspection under our laws are amply sufficient to prevent the exportation from this country of diseased cattle and unwholesome meat.

The termination of the civil war in Brazil has been followed by the general prevalence of peace and order. It appearing at an early stage of the insurrection that its course would call for unusual watchfulness on the part of this Government, our naval force in the harbor of Rio de Janeiro was strengthened. This precaution, I am satisfied, tended to restrict the issue to a simple trial of strength between the Brazilian Government and the insurgents, and to avert complications which at times seemed imminent. Our firm attitude of neutrality was maintained to the end. The insurgents received no encouragement of eventual asylum from our commanders, and such opposition as they encountered was for the protection of our commerce and was clearly justified by public law.

A serious tension of relations having arisen at the close of the war between Brazil and Portugal by reason of the escape of the insurgent Admiral da Gama and his followers, the friendly offices of our representatives to those countries were exerted for the protection of the subjects of either within the territory of the other.

Although the Government of Brazil was duly notified that the commercial arrangement existing between the United States and that country based on the third section of the tariff act of 1890 was abrogated on Aug. 28, 1894, by the taking effect of the tariff law now in force, that Government subsequently notified us of its intention to terminate such arrangement on the 1st day of January, 1895, in the exercise of the right reserved in the agreement between the two countries. I invite attention to the correspondence between the Secretary of State and the Brazilian minister on this subject.

The commission organized under the convention which we had entered into with Chili for the settlement of the outstanding claims of each government against the other adjourned at the end of the period stipulated for its continuance, leaving undetermined a number of American cases which had been duly presented. These claims are not barred, and negotiations are in progress for their submission to a new tribunal.

On the 17th of March last a new treaty with China

in further regulation of immigration was signed at Washington, and on Aug. 13 it received the sanction of the Senate. Negotiations on the part of China and formal exchange are awaited to give effect to this mutually beneficial convention.

A gratifying recognition of the uniform impartiality of this country toward all foreign states was manifested by the coincident request of the Chinese and Japanese governments that the agents of the United States should, within proper limits, afford protection to the subjects of the other during the suspension of diplomatic relations due to a state of war. This official office was accepted, and a misapprehension which gave rise to the belief that in affording this kindly unofficial protection our agents would exercise the same authority which the withdrawn agents of the belligerents had exercised was promptly corrected. Although the war between China and Japan endangers no policy of the United States, it deserves our greatest consideration, by reason of its disturbance of our growing commercial interests in the two countries and the increased dangers which may result to our citizens domiciled or sojourning in the interior of China.

Acting under a stipulation in our treaty with Korea (the first concluded with a Western power), I felt constrained at the beginning of the controversy to tender our good offices to induce an amicable arrangement of the initial difficulty growing out of the Japanese demands for administrative reforms in Korea, but the unhappy precipitation of actual hostilities defeated this kindly purpose.

Deplored the destructive war between the two most powerful of the Eastern nations, and anxious that our commercial interests in those countries may be preserved and that the safety of our citizens there shall not be jeopardized, I would not hesitate to lend any intimation that our friendly aid for the honorable termination of hostilities would be acceptable to both belligerents.

A convention has been finally concluded for the settlement by arbitration of the prolonged dispute with Ecuador growing out of the proceedings against Emilio Santos, a naturalized citizen of the United States.

Our relations with the Republic of France continue to be such as should exist between nations as long bound together by friendly sympathy and similarity in their form of government.

The recent cruel assassination of the President of this sister republic called forth such universal expressions of sorrow and condolence from our people and Government as to leave no doubt of the depth and sincerity of our attachment. The resolutions passed by the Senate and House of Representatives on the occasion have been communicated to the widow of President Carnot.

Acting upon the reported discovery of Texas fever in cargoes of American cattle, the German prohibition against importations of live stock and fresh meats from this country has been revived. It is hoped that Germany will soon become convinced that the prohibition is as needless as it is harmful to mutual interests.

The German Government has protested against that provision of the customs tariff act which imposes a discriminating duty of one tenth of 1 cent a pound on sugars coming from countries paying an export bounty thereon, claiming that the sanction of such a duty is in contravention of Articles V and IX of the treaty of 1828 with Prussia.

In the interests of the commerce of both countries, and to avoid even the accusation of treaty violation, I recommend the repeal of so much of the statute as imposes that duty, and I invite attention to the accompanying report of the Secretary of State containing a discussion of the questions raised by the German protests.

Early in the present year an agreement was reached with Great Britain concerning instructions to be given to the naval commanders of the two governments in

Bering Sea and the contiguous north Pacific Ocean, for their guidance in the execution of the award of the Paris Tribunal of Arbitration and the enforcement of the regulations therein prescribed for the protection of seal life in the waters mentioned. An understanding has also been reached for the payment by the United States of \$425,000, in full satisfaction of all claims which may be made by Great Britain for damages growing out of the controversy as to fur seals in Bering Sea, or the seizure of British vessels engaged in taking seal in those waters. The award and findings of the Paris tribunal to a great extent determined the facts and principles upon which these claims should be adjusted, and they have been subjected by both governments to a thorough examination upon the principles as well as the facts which they involve. I am convinced that a settlement upon the terms mentioned would be an equitable and advantageous one, and I recommend that provision be made for the prompt payment of the stated sum.

Thus far only France and Portugal have signified their willingness to adhere to the regulations established under the award of the Paris Tribunal of Arbitration.

Preliminary surveys of the Alaskan boundary and a preparatory examination of the question of protection of food fish in the contiguous waters of the United States and the Dominion of Canada are in progress.

The boundary of British Guiana still remains in dispute between Great Britain and Venezuela. Believing that its early settlement, on some just basis alike honorable to both parties, is in the line of our established policy to remove from this hemisphere all causes of difference with powers beyond the sea, I shall renew the efforts heretofore made to bring about a restoration of diplomatic relations between the disputants, and to induce a reference to arbitration—a resort which Great Britain so conspicuously favors in principle and respects in practice, and which is earnestly sought by her weaker adversary.

Since communicating the voluminous correspondence in regard to Hawaii and the action taken by the Senate and House of Representatives on certain questions submitted to the judgment and wider discretion of Congress, the organization of a government in place of the provisional arrangement which followed the deposition of the Queen has been announced, with evidence of its effective operation. The recognition usual in such cases has been accorded the new Government.

Under our present treaties of extradition with Italy miscarriages of justice have occurred owing to the refusal of that Government to surrender its own subjects. Thus far our efforts to negotiate an amended convention obviating this difficulty have been unavailing.

Apart from the war in which the island empire is engaged, Japan attracts increasing attention in this country by her evident desire to cultivate more liberal intercourse with us, and to seek our kindly aid in furtherance of her laudable desire for complete autonomy in her domestic affairs and full equality in the family of nations. The Japanese Empire of today is no longer the Japan of the past, and our relations with this progressive nation should not be less broad and liberal than those with other powers.

Good will, fostered by many interests in common, has marked our relations with our nearest southern neighbor. Peace being restored along her northern frontier, Mexico has asked the punishment of the late disturbers of her tranquillity. There ought to be a new treaty of commerce and navigation with that country to take the place of the one which terminated thirteen years ago. The friendliness of the intercourse between the two countries is attested by the fact that during this long period the commerce of each has steadily increased under the rule of mutual consideration, being neither stimulated by conventional arrangements nor retarded by jealous rivalries or selfish distrust.

An indemnity tendered by Mexico, as a gracious act, for the murder in 1887 of Leon Baldwin, an American citizen, by a band of marauders in Durango, has been accepted and is being paid in installments.

The problem of the storage and use of the waters of the Rio Grande for irrigation should be solved by appropriate concurrent action of the two interested countries. Rising in the Colorado heights, the stream flows intermittently, yielding little water during the dry months to the irrigating channels already constructed along its course. This scarcity is often severely felt in the regions where the river forms a common boundary. Moreover, the frequent changes in its course through level sands often raise embarrassing questions of territorial jurisdiction.

Prominent among the questions of the year was the Bluefields incident, in what is known as the Mosquito Indian Strip, bordering on the Atlantic Ocean and within the jurisdiction of Nicaragua. By the treaty of 1860 between Great Britain and Nicaragua the former Government expressly recognized the sovereignty of the latter over the Strip, and a limited form of self-government was guaranteed to the Mosquito Indians, to be exercised according to their customs, for themselves and other dwellers within its limits. The so-called native government, which grew to be largely made up of aliens, for many years disputed the sovereignty of Nicaragua over the Strip and claimed the right to maintain therein a practically independent municipal government. Early in the past year efforts of Nicaragua to maintain sovereignty over the Mosquito territory led to serious disturbances, culminating in the suppression of the native government and the attempted substitution of an impracticable composite administration, in which Nicaragua and alien residents were to participate. Failure was followed by an insurrection which for a time subverted Nicaraguan rule, expelling her officers and restoring the old organization. This, in turn, gave place to the existing local government established and upheld by Nicaragua.

Although the alien interests arrayed against Nicaragua in these transactions have been largely American, and the commerce of that region for some time has been and still is chiefly controlled by our citizens, we can not for that reason challenge the rightful sovereignty of Nicaragua over this important part of her domain.

For some months one, and during part of the time two, of our naval ships have been stationed at Bluefields for the protection of all legitimate interests of our citizens. In September last the Government at Managua expelled from its territory twelve or more foreigners, including two Americans, for alleged participation in the seditious or revolutionary movements against the republic at Bluefields already mentioned; but through the earnest remonstrance of this Government the two Americans have been permitted to return to the peaceful management of their business. Our naval commanders at the scene of these disturbances, by their constant exhibition of firmness and good judgment, contributed largely to the prevention of more serious consequences and to the restoration of quiet and order. I regret that in the midst of these occurrences there happened a most grave and irritating failure of Nicaraguan justice. An American citizen named Wilson, residing at Rama, in the Mosquito territory, was murdered by one Argüello, the acting governor of the town. After some delay the murderer was arrested, but so insecurely confined or guarded that he escaped, and, notwithstanding our repeated demands, it is claimed that his recapture has been impossible by reason of his flight beyond Nicaraguan jurisdiction.

The Nicaraguan authorities having given notice of forfeiture of their concession to the canal company on grounds purely technical and not embraced in the contract, have receded from that position.

Peru, I regret to say, shows symptoms of domestic disturbance, due probably to the slowness of her re-

operation from the distresses of the war of 1891. Weakened in resources, her difficulties in facing international obligations invite our kindly sympathy and justify our forbearance in pressing long-pending claims. I have felt constrained to testify this sympathy in connection with certain demands urgently preferred by other powers.

The recent death of the Czar of Russia called forth appropriate expressions of sorrow and sympathy on the part of our Government with his bereaved family and the Russian people. As a further demonstration of respect and friendship our minister at St. Petersburg was directed to represent our Government at the funeral ceremonies.

The sailing interests of Russia in Bering Sea are needed only to our own. A *modus vivendi* has therefore been concluded with the Imperial Government restrictive of poaching on the Russian rookeries, and of sailing in waters which were not comprehended in the protected area defined in the Paris award.

Attention has been found to urge upon the Russian Government equality of treatment for our great life insurance companies, whose operations have been extended throughout Europe. Admitting, as we do, foreign corporations to transact business in the United States, we naturally expect no less tolerance for our own in the ample fields of competition abroad.

But few cases of interference with naturalized citizens returning to Russia have been reported during the current year. One Kraminski was arrested last summer in a Polish province on a reported charge of permitted renunciation of Russian allegiance, but it transpired that the proceedings originated in alleged malfeasance committed by Kraminski while an Imperial official a number of years ago. Efforts for his release, which promised to be successful, were in progress when his death was reported.

The Government of Salvador having been overthrown by an abrupt popular outbreak, certain of its military and civil officers, while hotly pursued by infuriated insurgents, sought refuge on board the United States war ship "Bennington," then lying in a Salvadorian port. Although the practice of asylum is not favored by this Government, yet, in view of the imminent peril which threatened the fugitives, and solely from considerations of humanity, they were afforded shelter by our naval commander, and when afterward demanded under our treaty of extradition with Salvador for trial on charges of murder, arson, and robbery, I directed that such of them as had not voluntarily left the ship be conveyed to one of our nearest ports, where a hearing could be had before a judicial officer in compliance with the terms of the treaty. On their arrival at San Francisco such a proceeding was promptly instituted before the United States district judge, who held that the acts constituting the alleged offenses were political, and discharged all the accused except one Cienfuegos, who was held for an attempt to murder. Thereupon I was constrained to direct his release, for the reason that an attempt to murder was not one of the crimes charged against him and upon which his surrender to the Salvadorian authorities had been demanded.

Unreasonable and unjust fines imposed by Spain on the vessels and cargoes of the United States have demanded from time to time during the last twenty years earnest remonstrance on the part of our Government. In the immediate past exorbitant penalties have been imposed upon our vessels and goods by customs authorities of Cuba and Puerto Rico for clerical errors of the most trivial character in the manifests or bills of lading. In some cases, fines amounting to thousands of dollars have been levied upon cargoes or the carrying vessels when the goods in question were entitled to free entry. Fines have been exacted even when the error had been detected and the Spanish authorities notified before the arrival of the goods in port.

This conduct is in strange contrast with the considerate and liberal treatment extended to Spanish vessels and cargoes in our ports in like cases. No

satisfactory settlement of these vexatious questions has yet been reached.

The Mora case, referred to in my last annual message, remains unsettled. From the diplomatic correspondence on this subject which has been laid before the Senate, it will be seen that this Government has offered to conclude a convention with Spain for disposal by arbitration of outstanding claims between the two countries, except the Mora claim, which, having been long ago adjusted, now only awaits payment as stipulated, and, of course, it could not be included in the proposed convention. It was hoped that this offer would remove parliamentary obstacles encountered by the Spanish Government in proceeding payment of the Mora indemnity. I regret to say that no definite reply to this offer has yet been made, and all efforts to secure payment of this settled claim have been unavailing.

In my last annual message I adverted to the claim on the part of Turkey of the right to expel, as persons undesirable and dangerous, Armenians naturalized in the United States and returning to Turkish jurisdiction. Numerous questions in this relation have arisen. While this Government acquiesces in the asserted right of expulsion, it will not consent that Armenians may be imprisoned or otherwise punished for no other reason than having acquired without Imperial consent American citizenship.

Three of the assistants of Miss Melton, an American teacher in Mosul, have been convicted by the Ottoman courts, and I am advised that an appeal against the acquittal of the remaining five has been taken by the Turkish prosecuting officer.

A convention has been concluded with Venezuela for the arbitration of a long-disputed claim growing out of the seizure of certain vessels, the property of citizens of the United States. Although signed, the treaty of extradition with Venezuela is not yet in force, owing to the insistence of that Government that when surrendered its citizens shall in no case be liable to capital punishment.

The rules for the prevention of collisions at sea which were framed by the maritime conference held in this city in 1889, having been concurrently incorporated in the statutes of the United States and Great Britain, have been announced to take effect March 1, 1893, and invitations have been extended to all maritime nations to adhere to them. Favorable responses have thus far been received from Austria, France, Portugal, Spain, and Sweden.

In my last annual message I referred briefly to the unsatisfactory state of affairs in Samoa under the operation of the Berlin Treaty, as signally illustrating the impolicy of entangling alliances with foreign powers; and on May 9, 1894, in response to a resolution of the Senate, I sent a special message and documents to that body on the same subject, which emphasized my previously expressed opinions. Later occurrences, the correspondence in regard to which will be laid before Congress, further demonstrate that the Government which was devised by the three powers and forced upon the Samoans against their inveterate hostility, can be maintained only by the continued presence of foreign military force, and at no small sacrifice of life and treasure.

The suppression of the Matafua insurrection by the powers, and the subsequent banishment of the leader and 11 other chiefs, as recited in my last message, did not bring lasting peace to the islands. Formidable springing continued, and finally a rebellion broke out in the capital island, Upolu, headed in Aana, the western district, by the younger Tamasese, and in Atua, the eastern district, by other leaders. The insurrection ravaged the country and fought the Government troops up to the very doors of Apia. The King again appealed to the powers for help, and the combined British and German naval forces reduced the Atua to apparent subjection, not, however, without considerable loss to the natives. A few days later Tamasese and his adherents, fearing the ships and the marines, professed submission.

Reports received from our agents at Apia do not justify the belief that the peace thus brought about will be of long duration. It is their conviction that the natives are at heart hostile to the present Government; that such of them as profess loyalty to it do so from fear of the powers, and that it would speedily go to pieces if the war ships were withdrawn. In reporting to his Government on the unsatisfactory situation since the suppression of the late revolt by foreign armed forces, the German consul at Apia stated:

"That peace will be lasting is hardly to be presumed. The lesson given by firing on Atua was not sufficiently sharp and incisive to leave a lasting impression on the forgetful Samoan temperament. In fact, conditions are existing which show that peace will not last and is not seriously intended. Malietoa, the King, and his chiefs are convinced that the departure of the war ships will be a signal for a renewal of war. The circumstance that the representatives of the villages of all the districts which were opposed to the Government have already withdrawn to Atua to hold meetings, and that both Atua and Aana have forbidden inhabitants of those districts which fought on the side of the Government to return to their villages and have already partly burned down the latter, indicates that a real conciliation of the parties is still far off."

And in a note of the 10th ultimo, inclosing a copy of that report for the information of this Government, the German ambassador said:

"The contents of the report awakened the Imperial Government's apprehension that under existing circumstances the peace concluded with the rebels will afford no assurance of the lasting restoration of tranquillity in the islands."

The present Government has utterly failed to correct, if indeed it has not aggravated, the very evils it was intended to prevent. It has not stimulated our commerce with the islands. Our participation in its establishment against the wishes of the natives was in plain defiance of the conservative teachings and warnings of the wise and patriotic men who laid the foundations of our free institutions, and I invite an expression of the judgment of Congress on the propriety of steps being taken by this Government looking to the withdrawal from its engagements with the other powers on some reasonable terms not prejudicial to any of our existing rights.

The Secretary of the Treasury reports that the receipts of the Government from all sources of revenue during the fiscal year ending June 30, 1894, amounted to \$372,802,498.29, and its expenditures to \$442,605,758.87, leaving a deficit of \$69,803,260.58. There was a decrease of \$13,952,674.66 in the ordinary expenses of the Government as compared with the fiscal year 1893.

There was collected from customs \$131,518,530.62, and from internal revenue \$147,168,449.70. The balance of the income for the year, amounting to \$93,815,517.97, was derived from the sales of lands and other sources.

The value of our total dutiable imports amounted to \$373,199,086, being \$146,637,625 less than during the preceding year; and the importations free of duty amounted to \$379,795,536, being \$64,748,675 less than during the preceding year. The receipts from customs were \$73,556,464.11 less, and from internal revenue \$13,856,559.97 less, than in 1893.

The total tax collected from distilled spirits was \$85,259,250.25; on manufactured tobacco, \$28,617,599.62; and on fermented liquors, \$31,414,788.04.

Our exports of merchandise, domestic and foreign, amounted during the year to \$892,140,572, being an increase over the preceding year of \$44,495,378.

The total amount of gold exported during the fiscal year was \$76,899,061, as against \$108,680,444 during the fiscal year 1893. The amount imported was \$72,449,119, as against \$21,174,351 during the previous year.

The imports of silver were \$13,266,552, and the exports were \$50,451,265.

The total bounty paid upon the production of sugar in the United States for the fiscal year was \$12,100,208.89, being an increase of \$2,725,078.01 over the payments made during the preceding year. The amount of bounty paid from July 1, 1894, to Aug. 28, 1894, the time when further payment ceased by operation of law, was \$966,183.84. The total expenses incurred in the payment of the bounty upon sugar during the fiscal year was \$130,140.85.

It is estimated that upon the basis of the present revenue laws the receipts of the Government during the current fiscal year ending June 30, 1895, will be \$424,427,748.44, and its expenditures \$444,427,748.44, resulting in a deficit of \$20,000,000.

On the 1st day of November, 1894, the total stock of money of all kinds in the country was \$2,240,773,588, as against \$2,204,651,000 on the 1st day of November, 1893; and the money of all kinds in circulation, or not included in the Treasury holdings, was \$1,672,093,422, or \$24.27 *per capita*, upon an estimated population of 68,887,000. At the same date there was held in the Treasury gold bullion amounting to \$44,615,177.55, and silver bullion which was purchased at a cost of \$127,779,988. The purchase of silver bullion under the act of July 14, 1890, ceased on the 1st day of November, 1893, and up to that time there had been purchased during the fiscal year 11,917,658.78 fine ounces at a cost of \$8,715,521.32, an average cost of \$0.7313 *per fine ounce*. The total amount of silver purchased from the time that law took effect until the repeal of its purchasing clause, on the date last mentioned, was 168,674,682.53 fine ounces, which cost \$155,931,602.25, the average price *per fine ounce* being \$0.9244.

The total amount of standard silver dollars coined at the mints of the United States since the passage of the act of Feb. 28, 1873, is \$421,776,408, of which \$378,166,793 were coined under the provisions of that act, \$38,531,143 under the provisions of the act of July 14, 1890, and \$5,078,472 under the act providing for the coinage of trade-dollar bullion.

The total coinage of all metals at our mints during the last fiscal year consisted of 63,485,220 pieces, valued at \$106,216,730.06, of which there were \$99,474,912.50 in gold coined, \$758 in standard silver dollars, \$6,024,140.30 in subsidiary silver coin, and \$716,919.26 in minor coin.

During the calendar year 1893 the production of precious metals in the United States was estimated at 1,739,323 fine ounces of gold, of the commercial and coinage value of \$35,955,000, and 60,000,000 fine ounces of silver, of the bullion or market value of \$46,800,000 and of the coinage value of \$77,576,000. It is estimated that on the 1st day of July, 1894, the stock of metallic money in the United States, consisting of coin and bullion, amounted to \$1,251,640,958, of which \$627,923,201 was gold and \$624,347,757 was silver.

Fifty national banks were organized during the year ending Oct. 31, 1894, with a capital of \$5,255,000, and 79, with a capital of \$10,475,000, went into voluntary liquidation. Twenty-one banks, with a capital of \$2,770,000, were placed in the hands of receivers. The total number of national banks in existence on the 31st day of October last was 3,756, being 40 less than on the 31st day of October, 1893. The capital stock paid in was \$672,671,865, being \$9,678,491 less than at the same time in the previous year, and the surplus fund and undivided profits, less expenses and taxes paid, amounted to \$334,121,082.10, which was \$16,069,780 less than on Oct. 31, 1893. The circulation was decreased \$1,741,563. The obligations of the banks to each other were increased \$117,268,334, and the individual deposits were \$277,294,489 less than at the corresponding date in the previous year. Loans and discounts were \$161,206,923 more than at the same time the previous year, and checks and other cash items were \$90,349,963 more. The total resources of the banks at the date mentioned amounted to \$3,473,922,055, as against \$3,109,563,284.36 in 1893.

From the report of the Secretary of War it appears

that the strength of the army on Sept. 30, 1894, was 2,185 officers and 25,745 enlisted men. Although this is apparently a very slight decrease compared with the previous year, the actual effective force has been increased to the equivalent of nearly two regiments through the reorganization of the system of recruiting, and the consequent release to regimental duty of the large force of men hitherto serving at the recruiting depots. The abolition of these depots, it is predicted, will furthermore effect an annual reduction approximating \$250,000 in the direct expenditures, besides promoting generally the health, morale, and discipline of the troops.

The execution of the policy of concentrating the army at important centers of population and transportation, foreshadowed in the last annual report of the Secretary, has resulted in the abandonment of 14 of the smaller posts, which was effected under a plan which assembles organizations of the same regiments hitherto widely separated. This renders our small force more readily effective for any service which they may be called upon to perform, increases the extent of the territory under protection without diminishing the security heretofore afforded to any locality, improves the discipline, training, and esprit de corps of the army, besides considerably decreasing the cost of its maintenance.

Though the force of the Department of the East have been somewhat increased, more than three-fourths of the army is still stationed west of the Mississippi. This carefully matured policy, which secures the best and greatest service in the interests of the general welfare from the small force comprising our regular army, should not be thoughtlessly embarrassed by the creation of new and unnecessary posts through acts of Congress to gratify the ambitions or interests of localities.

While the maximum legal strength of the army is 50,000 men, the effective strength, through various causes, is but little over 20,000 men. The purpose of Congress does not, therefore, seem to be fully attained by the existing condition. While no considerable increase in the army is, in my judgment, demanded by recent events, the policy of seacoast fortification, in the prosecution of which we have been steadily engaged for some years, has so far developed as to suggest that the effective strength of the army be now made at least equal to the legal strength. Measures taken by the department during the year, as indicated, have already considerably augmented the effective force, and the Secretary of War presents a plan, which I recommend to the consideration of Congress, to attain the desired end. Economy effected in the department in other lines of its work will offset to a great extent the expenditure involved in the proposition submitted. Among other things, this contemplates the adoption of the three-battalion formation of regiments, which for several years has been indicated by the Secretary of War and the generals commanding the army. Compact in itself, it provides a skeleton organization, ready to be filled out in the event of war, which is peculiarly adapted to our strength and requirements; and the fact that every other nation, with a single exception, has adopted this formation to meet the conditions of modern warfare should alone secure for the recommendation an early consideration.

It is hardly necessary to recall the fact that, in obedience to the commands of the Constitution and the laws and for the purpose of protecting the property of the United States, aiding the process of Federal courts, and removing lawless obstructions to the performance by the Government of its legitimate functions, it became necessary in various localities during the year to employ a considerable portion of the regular troops. The duty was discharged promptly, unopposed, and with marked discretion by the officers and men, and the most gratifying proof was thus afforded that the army deserves that complete confidence in its efficiency and discipline which the country has at all times manifested.

The year has been free from disturbances by Indians, and the chance of further depredations on their part are constantly becoming more remote and improbable.

The total expenditures of the War Department for the year ended June 30, 1894, amounted to \$26,022,000.54. Of this sum \$1,000,514.39 was for salaries and contingent expenses, \$22,643,156.16 for the support of the military establishment, \$2,001,692.22 for miscellaneous objects, and \$25,871,250.34 for public works. This latter sum includes \$19,494,077.49 for river and harbor improvements, and \$6,377,172.85 for fortifications and other works of defense. The appropriations for the current year aggregate \$24,423,112.78, and the estimate submitted by the Secretary of War for the next fiscal year calls for appropriations amounting to \$25,212,629.35.

The skill and industry of our ordnance officers and inventors have, it is believed, overcome the mechanical obstacles which have heretofore delayed the armament of our vessels, and this great national undertaking upon which we have entered may now proceed as rapidly as Congress shall determine. With a supply of finished guns of large caliber already on hand, to which additions should now rapidly follow, the wisdom of providing carriage and appliances for their mount can not be too strongly urged.

The total enrollment of the militia of the several States is 117,343 officers and enlisted men, an increase of 5,443 over the number reported at the close of the previous year. The reports of militia inspections by regular army officers show a marked increase in interest and efficiency among the State organizations, and I strongly recommend a continuation of the policy of affording every practical encouragement possible to this important auxiliary of our military establishment.

The condition of the Apache Indians, held as prisoners by the Government for eight years at a cost of \$500,000, has been changed during the year from captivity to one which gives them an opportunity to demonstrate their capacity for self support and at least partial civilization. Legislation enacted at the late session of Congress gave the War Department authority to transfer the survivors, numbering 346, from Mount Vernon Barracks, in Alabama, to any suitable reservation. The department selected as their future home the military lands near Fort Sill, Indian Territory, where, under military surveillance, the former prisoners have been established in agriculture under conditions favorable to their advancement.

In recognition of the long and distinguished military services and faithful discharge of delicate and responsible civil duties by Major-General John M. Schofield, now the general commanding the army, it is suggested to Congress that the temporary revival of the grade of lieutenant general in his behalf would be a just and gracious act, and would mark his retirement, now near at hand, with such fitting honors.

The report of the Attorney-General notes the gratifying progress made by the Supreme Court in overcoming the arrears of its business and in reaching a condition in which it will be able to dispose of cases as they arise without any unreasonable delay. This result is of course very largely due to the successful working of the plan inaugurating circuit courts of appeals. In respect to these tribunals, the suggestion is made in quarters entitled to the highest consideration that an additional circuit judge for each circuit would greatly strengthen these courts and the confidence reposed in their adjudications, and that such an addition would not involve a greater force of judges than the increasing business of such courts requires. I commend the suggestion to the careful consideration of the Congress. Other important topics are adverted to in the report, accompanied by recommendations, many of which have been treated at large in previous messages, and at this time, therefore, need only to be

named. I refer to the abolition of the fee system as a measure of compensation to Federal officers; the enlargement of the powers of United States commissioners, at least in the Territories, the allowance of writs of error in criminal cases on behalf of the United States, and the establishment of degrees in the crime of murder. A topic dealt with by the Attorney-General of much importance is the condition of the administration of justice in the Indian Territory. The permanent solution of what is called the Indian problem is probably not to be expected at once, but meanwhile such ameliorations of present conditions as the existing system will admit of ought not to be neglected. I am satisfied there should be a Federal court established for the Territory with sufficient judges, and that this court should sit within the Territory and have the same jurisdiction as to Territorial affairs as is now vested in the Federal courts sitting in Arkansas and Texas.

Another subject of pressing moment referred to by the Attorney-General is the reorganization of the Union Pacific Railway Company on a basis equitable as regards all private interests and as favorable to the Government as existing conditions will permit. The operation of a railroad by a court through a receiver is an anomalous state of things, which should be terminated, on all grounds, public and private, at the earliest possible moment. Besides, not to enact the needed enabling legislation at the present session postpones the whole matter until the assembling of a new Congress, and inevitably increases all the complications of the situation, and could not but be regarded as a signal failure to solve a problem which has practically been before the present Congress ever since its organization.

Eight years ago, in my annual message, I urged upon the Congress as strongly as I could the location and construction of 2 prisons for the confinement of United States prisoners. A similar recommendation has been made from time to time since, and a few years ago a law was passed providing for the selection of sites for 3 such institutions. No appropriation has, however, been made to carry the act into effect, and the old and discreditable condition still exists.

It is not my purpose at this time to repeat the considerations which make an impregnable case in favor of the ownership and management by the Government of the penal institutions in which Federal prisoners are confined. I simply desire to again urge former recommendations on the subject, and to particularly call the attention of the Congress to that part of the report of the Secretary of War in which he states that the military prison at Fort Leavenworth, Kan., can be turned over to the Government as a prison for Federal convicts without the least difficulty and with an actual saving of money from every point of view.

Pending a more complete reform, I hope that by the adoption of the suggestion of the Secretary of War this easy step may be taken in the direction of the proper care of its convicts by the Government of the United States.

The report of the Postmaster-General presents a comprehensive statement of the operations of the Post Office Department for the last fiscal year.

The receipts of the department during the year amounted to \$75,060,479.04 and the expenditures to \$64,324,414.15.

The transactions of the postal service indicate with barometric certainty the fluctuations in the business of the country. Inasmuch, therefore, as business complications continued to exist throughout the last year to an unforeseen extent, it is not surprising that the deficiency of revenue to meet the expenditures of the Post Office Department, which was estimated in advance at about \$8,000,000, should be exceeded by nearly \$1,250,000. The ascertained revenues of the last year, which were the basis of circulation for the current year, being less than estimated, the deficiency for the current year will be correspondingly greater, though the Postmaster-General states that the latest

indications are so favorable that he confidently predicts an increase of at least 8 per cent. in the revenues of the current year over those of the last year.

The expenditures increase steadily and necessarily with the growth and needs of the country, so that the deficiency is greater or less in any year, depending upon the volume of receipts.

The Postmaster-General states that this deficiency is unnecessary, and might be obviated at once if the law regulating rates upon mail matter of the second class was modified. The rate received for the transmission of this second-class matter is 1 cent per pound, while the cost of such transmission to the Government is eight times that amount. In the general terms of the law this rate covers newspapers and periodicals. The extensions of the meaning of these terms from time to time have admitted to the privileges intended for legitimate newspapers and periodicals a surprising range of publications, and created abuses the cost of which amounts in the aggregate to the total deficiency of the Post Office Department. Pretended newspapers are started by business houses for the mere purpose of advertising goods, complying with the law in form only, and discontinuing the publications as soon as the period of advertising is over. "Sample copies" of pretended newspapers are issued in great numbers for a like purpose only. The result is a great loss of revenue to the Government, besides its humiliating use as an agency to aid in carrying out the scheme of a business house to advertise its goods by means of a trick upon both its rival houses and the regular and legitimate newspapers. Paper-covered literature, consisting mainly of trashy novels to the extent of many thousands of tons, is sent through the mails at 1 cent per pound, while the publishers of standard works are required to pay eight times that amount in sending their publications. Another abuse consists in the free carriage through the mails of hundreds of tons of seed and grain uselessly distributed through the Department of Agriculture. The Postmaster-General predicts that if the law be so amended as to eradicate these abuses not only will the Post Office Department show no deficiency, but he believes that in the near future all legitimate newspapers and periodical magazines might be properly transmitted through the mails to their subscribers free of cost. I invite your prompt consideration of this subject, and fully endorse the views of the Postmaster General.

The total number of post offices in the United States on the 30th day of June, 1894, was 69,505, an increase of 1,403 over the preceding year. Of these, 3,428 were presidential; an increase in that class of 68 over the preceding year.

Six hundred and ten cities and towns are provided with free delivery. Ninety-three other cities and towns entitled to this service under the law have not been accorded it on account of insufficient funds. The expense of free delivery for the current fiscal year will be more than \$12,300,000, and under existing legislation this item of expenditure is subject to constant increase. The estimated cost of rural free delivery generally is so very large that it ought not to be considered in the present condition of affairs.

During the year 830 additional domestic money-order offices were established. The total number of these offices at the close of the year was 19,264. There were 14,304,041 money orders issued during the year, being an increase over the preceding year of 994,306. The value of these orders amounted to \$138,793,579.49, an increase of \$11,217,145.84. There were also issued during the year postal notes amounting to \$12,649,094.55.

During the year 218 international money-order offices were added to those already established, making a total of 2,625 such offices in operation June 30, 1894. The number of international money orders issued during the year was 917,823, a decrease in number of 138,176; and their value was \$13,792,455.31, a decrease in amount of \$2,549,382.55. The number of orders paid was 361,180, an increase over the

preceding year of \$6,805, and their value was \$4,565,485.74, an increase of \$1,285,118.08.

From the foregoing statements it appears that the total income of money orders and postal notes for the year amounted to \$165,255,129.55.

The number of letters and packages mailed during the year for special delivery was 3,154,370. The special-delivery stamps used upon these letters and packages amounted to \$343,897. The messengers' fees paid for their delivery amounted to \$381,309.70, leaving a balance in favor of the Government of \$6,461.55.

The report shows most gratifying results in the way of economies worked out without affecting the efficiency of the postal service. These consist in the abolition of steamship-subsidy contracts, retelling of mail-transportation contracts, and in the cost and amount of supplies used in the service, amounting in all to \$14,819,647.42.

This report also contains a valuable contribution to the history of the Universal Postal Union, an arrangement which amounts practically to the establishment of one postal system for the entire civilized world. Special attention is devoted to this subject at this time, in view of the fact that the next congress of the union will meet in Washington in 1897, and it is hoped that timely action will be taken in the discussion of perfecting propositions for that event.

The Postmaster-General repeats the suggestion made in a previous report that the department organization be increased to the extent of creating a direct district supervision of all postal affairs, and in this suggestion I fully concur.

There are now connected with the post office establishment 21,081 employees who are in the classified service. This includes many who have been classified upon the suggestion of the Postmaster-General. He states that another year's experience at the head of the department serves only to strengthen the conviction as to the excellent working of the civil-service law in this branch of the public service.

Attention is called to the report of the Secretary of the Navy, which shows very gratifying progress in the construction of ships for our new navy. All the vessels now building, including the 3 torpedo boats authorized at the last session of Congress and comprising the first-class battle ship "Iowa," will probably be completed during the coming fiscal year.

The estimates for the increase of the navy for the year ending June 30, 1898, are large, but they include probably the entire sum necessary to complete and equip all the new ships now in commission, so that, unless new ships are authorized, the appropriations for the naval service for the fiscal year ending June 30, 1897, should fall below the estimates for the coming year by at least \$12,000,000.

The Secretary presents with much earnestness a plan for the authorization of 5 additional battle ships and 10 or 12 torpedo boats. While the unarmored vessels heretofore authorized, including those now nearing completion, will constitute a fleet which it is believed is sufficient for ordinary cruising purposes in time of peace, we have now completed and in process of construction but 4 first-class battle ships and but few torpedo boats. If we are to have a navy for warlike operations, offensive and defensive, we certainly ought to increase both the number of battle ships and torpedo boats.

The manufacture of armor requires expensive plant and the aggregation of many skilled workmen. All the armor necessary to complete the vessels now building will be delivered before the first of June next. If no new contracts are given out, contractors must disband their workmen and their plants must idle. Battle ships authorized at this time would not be well under way until late in the coming fiscal year, and at least three years and a half from the date of the contract would be required for their completion. The Secretary states that not more than 15 per cent. of the cost of such ships need be included in the appropriations for the coming year.

I recommend that provision be made for the construction of additional battle ships and torpedo boats.

The Secretary recommends the manufacture not only of a reserve supply of ordnance and ordnance material for ships of the navy, but also a supply for the auxiliary fleet. Guns and their appurtenances should be provided and kept on hand for both those purposes. We have not to-day a single gun that could be put upon the ships "Paris" or "New York" of the International Navigation Company or any other ship of our reserve navy.

The manufacture of guns at the Washington Navy Yard is proceeding satisfactorily, and none of our new ships will be required to wait for their guns or ordnance equipment.

An important order has been issued by the Secretary of the Navy co-ordinating the duties of the several bureaus concerned in the construction of ships. This order, it is believed, will secure to a greater extent than has heretofore been possible the harmonious action of these several bureaus, and make the attainment of the best results more certain.

During the past fiscal year there has been an unusual and growing demand in many quarters of the world for the presence of vessels to guard American interests.

In January last, during the Brazilian insurrection a large fleet was concentrated in the harbor of Rio de Janeiro. The vigorous action of Rear-Admiral Buchanan in protecting the personal and commercial rights of our citizens during the disturbed conditions afforded results which will, it is believed, have a far-reaching and wholesome influence whenever in like circumstances it may become necessary for our naval commanders to interfere on behalf of our people in foreign ports.

The war now in progress between China and Japan has rendered it necessary or expedient to dispatch 8 vessels to those waters.

Both the Secretary of the Navy and the Secretary of the Treasury recommend the transfer of the work of the Coast Survey proper to the Navy Department. I heartily concur in this recommendation. Excluding Alaska and a very small area besides, all the work of mapping and charting our coasts has been completed. The hydrographic work, which must be done over and over again by reason of the shifting and varying depths of water consequent upon the action of storms and tides, has heretofore been done under the direction of naval officers in subordination to the Superintendent of the Coast Survey. There seems to be no good reason why the navy should not have entire charge hereafter of such work, especially as the Hydrographic Office of the Navy Department is now, and has been for many years, engaged in making efficient maps entirely similar to those prepared by the Coast Survey.

I feel it my imperative duty to call attention to the recommendation of the Secretary in regard to the personnel of the line of the navy. The stagnation of promotion in this vital branch of the service is as great as to seriously impair its efficiency.

I consider it of the utmost importance that the young and middle-aged officers should, before the eve of retirement, be permitted to reach a grade entitling them to active and important duty.

The system adopted a few years ago regulating the employment of labor at the navy yards is rigidly upheld and has fully demonstrated its usefulness and expediency. It is within the domain of civil-service reform, inasmuch as workmen are employed through a board of labor selected at such navy yard and are given work without reference to politics and in the order of their application, preference, however, being given to army and navy veterans and those having former navy-yard experience.

Amendments suggested by experience have been made to the rules regulating the system. Through its operation the work at our navy yards has been vastly improved in efficiency, and the opportunity to

work has been honestly and fairly awarded to willing and competent applicants.

It is hoped that if this system continues to be strictly adhered to there will soon be as a natural consequence such an equalization of party benefits as will remove all temptation to relax or abandon it.

The report of the Secretary of the Interior exhibits the situation of the numerous and interesting branches of the public service connected with his department. I commend this report and the valuable recommendations of the Secretary to the careful attention of the Congress.

The public land disposed of during the year amounted to 10,406,100.77 acres, including 28,876.05 of Indian lands.

It is estimated that the public domain still remaining amounts to a little more than 600,000,000 acres, excluding, however, about 360,000,000 acres in Alaska as well as military reservations and railroad and other selections of lands yet unadjudicated.

The total cash receipts from sale of lands amounted to \$2,674,285.79, including \$91,981.03 received from Indian lands.

Thirty-five thousand patents were issued for agricultural lands, and 3,100 patents were issued to Indians on allotments of their holdings in severalty, the land so allotted being inalienable by the Indian allottees for a period of twenty-five years after patent.

There were certified and patented on account of railroad and wagon-road grants during the year 865,554.45 acres of land, and at the close of the year 29,000,000 acres were embraced in the lists of selections made by railroad and wagon-road companies and awaited settlement.

The selections of swamp lands and that taken as indemnity therefor since the passage of the act providing for the same in 1849 amount to nearly or quite 80,500,000 acres, of which 58,000,000 have been patented to States. About 138,000 acres were patented during the last year. Nearly 820,000 acres of school and education grants were approved during the year, and at its close 1,250,363.81 acres remained unadjudicated.

It appears that the appropriation for the current year on account of special service for the protection of the public lands and the timber thereon is much less than those for previous years and inadequate for an efficient performance of the work. A larger sum of money than has been appropriated during a number of years past on this account has been returned to the Government as a result of the labors of those employed in the particular service mentioned, and I hope it will not be crippled by insufficient appropriation.

I fully indorse the recommendation of the Secretary that adequate protection be provided for our forest reserves and that a comprehensive forestry system be inaugurated. Such keepers and superintendents as are necessary to protect the forests already reserved should be provided. I am of the opinion that there should be an abandonment of the policy sanctioned by present laws, under which the Government for a very small consideration is rapidly losing title to immense tracts of land covered with timber which should be properly reserved as permanent sources of timber supply.

The suggestion that a change be made in the manner of securing surveys of the public lands is especially worthy of consideration. I am satisfied that these surveys should be made by a corps of competent surveyors under the immediate control and direction of the Commissioner of the General Land Office.

An exceedingly important recommendation of the Secretary relates to the manner in which contests and litigated cases growing out of efforts to obtain Government land are determined. The entire testimony upon which these controversies depend in all their stages is taken before the local registers and receivers, and yet these officers have no power to subpoena witnesses or to enforce their attendance to testify. These

cases, numbering 3,000 or 4,000 annually, are sent by the local officers to the Commissioner of the General Land Office for his action. The exigencies of his other duties oblige him to act upon the decisions of the registers and receivers without an opportunity of thorough personal examination. Nearly 2,000 of these cases are appealed annually from the commissioner to the Secretary of the Interior. Burdened with other important administrative duties, his determination of these appeals must be almost perfunctory and based upon the examination of others, though this determination of the Secretary operates as a final adjudication upon rights of very great importance.

I concur in the opinion that the Commissioner of the General Land Office should be relieved from the duty of deciding litigated land cases, that a non-partisan court should be created to pass on such cases, and that the decisions of this court should be final, at least so far as the decisions of the department are now final. The proposed court might be given authority to certify questions of law, in matters of especial importance, to the Supreme Court of the United States or the Court of Appeals for the District of Columbia for decision. The creation of such a tribunal would expedite the disposal of cases and insure decisions of a more satisfactory character. The registers and receivers who originally hear and decide these disputes should be invested with authority to compel witnesses to attend and testify before them.

Though the condition of the Indians shows a steady and healthy progress, their situation is not satisfactory at all points. Some of them to whom allotments of land have been made are found to be unable or disinclined to follow agricultural pursuits or to otherwise beneficially manage their land. This is especially true of the Cheyennes and Arapahoes, who, as it appears by reports of their agent, have in many instances never been located upon their allotments, and in some cases do not even know where their allotments are. Their condition has deteriorated. They are not self-supporting, and they live in camps and spend their time in idleness.

I have always believed that allotments of reservation lands to Indians in severalty should be made sparingly, or at least slowly, and with the utmost caution. In these days, when white agriculturists and stock raisers of experience and intelligence find their lot a hard one, we ought not to expect Indians, unless far advanced in civilization and habits of industry, to support themselves on the small tracts of land usually allotted to them.

If the self-supporting scheme by allotment fails, the wretched pauperism of the allottees which results is worse than their original condition of regulated dependence. It is evident that the evil consequences of ill-advised allotment are intensified in cases where the false step can not be retraced on account of the purchase by the Government of reservation lands remaining after allotments are made and the disposition of such remaining lands to settlers or purchasers from the Government.

I am convinced that the proper solution of the Indian problem and the success of every step taken in that direction depend to a very large extent upon the intelligence and honesty of the reservation agents and the interest they have in their work. An agent fitted for his place can do much toward preparing the Indians under his charge for citizenship and allotment of their lands, and his advice as to any matter concerning their welfare will not mislead. An unfit agent will make no effort to advance the Indians on his reservation toward civilization or preparation for allotment of lands in severalty, and his opinion as to their condition in this and other regards is heedless and valueless.

The indications are that the detail of army officers as Indian agents will result in improved management on the reservations.

Whenever allotments are made and any Indian on

the reservation has previously settled upon a lot and cultivated it, or shown a disposition to improve it in any way, such lot should certainly be allotted to him, and this should be made plainly obligatory by statute.

In the light of experience, and considering the uncertainty of the Indian situation and its exigencies in the future, I am not only disposed to be very cautious in making allotments, but I incline to agree with the Secretary of the Interior in the opinion that when allotments are made the balance of reservation land remaining after allotment, instead of being bought by the Government from the Indians, and opened for settlement with such standards and unfair practices as were unavoidable, should remain for a time at least as common land or be sold by the Government on behalf of the Indians in an orderly way and at fixed prices to be determined by its location and desirability, and that the proceeds, less expenses, should be held in trust for the benefit of the Indian proprietors.

The intelligent Indian-school management of the past year has been followed by gratifying results. Efforts have been made to advance the work in a sound and practical manner. Five institutes of Indian teachers have been held during the year, and have proved very beneficial through the views exchanged and methods discussed particularly applicable to Indian education.

Efforts are being made in the direction of a gradual reduction of the number of Indian contract schools so that in a comparatively short time they may give way altogether to Government schools, and it is hoped that the change may be so gradual as to be perfected without too great expense to the Government or undue disregard of investments made by those who have established and are maintaining such contract schools.

The appropriation for the current year ending June 30, 1895, applicable to the ordinary expenses of the Indian service amounts to \$4,755,000.18, being less by \$664,540.84 than the sum appropriated on the same account for the previous year.

At the close of the last fiscal year, on the 30th day of June, 1894, there were 999,544 persons on our pension rolls, being a net increase of 5,532 over the number reported at the end of the previous year.

These pensioners may be classified as follows: Soldiers and sailors, survivors of all wars, 753,968; widows and relatives of deceased soldiers, 215,162; army nurses in the war of the rebellion, 414. Of these pensioners 22,059 are surviving soldiers of Indian and other wars prior to the late civil war and the widows or relatives of such soldiers.

The remainder, numbering 977,505, are receiving pensions on account of the war of the rebellion, and of these 489,344 are on the rolls under the authority of the act of June 27, 1890, sometimes called the dependent-pension law.

The total amount expended for pensions during the year was \$129,804,461.05, leaving an unexpended balance from the sums appropriated of \$25,300,712.65.

The sum necessary to meet pension expenditures for the year ending June 30, 1895, is estimated at \$140,000,000.

The Commissioner of Pensions is of the opinion that the year 1893, being the thirtieth after the close of the war of the rebellion, must, according to all sensible human calculation, see the highest limit of the pension roll, and that after that year it must begin to decline.

The claims pending in the bureau have decreased more than 90,000 during the year. A large proportion of the new claims filed are for increase of pension by those now on the rolls.

The number of certificates issued was 80,313.

The names dropped from the rolls for all causes during the year numbered 37,351.

Among our pensioners are 9 widows and 3 daughters of soldiers of the Revolution and 45 survivors of the War of 1812.

The barefaced and extensive pension frauds ex-

posed under the direction of the courageous and generous veteran soldier now at the head of the bureau leave no room for the claim that no perpetration of our pension rolls was needed, or that continued vigilance and prompt action are not necessary to the same end.

The assertion that an effort to detect pension frauds is evidence of unfriendliness toward our worthy veterans and a denial of their claims to the generosity of the Government suggests an unfortunate inference to the concession of any offense which has for its motive the securing of a pension, and inclines a willingness to be blind to the existence of mean and treacherous crimes which play upon democratic fears and make sport of the patriotic impulse of a grateful people.

The completion of the eleventh census is now in charge of the Commissioner of Labor. The total disbursements on account of the work for the fiscal year ending June 30, 1894, amounted to \$10,365,674.81. At the close of the year the number of persons employed in the Census Office was 679. At present there are about 400. The whole number of volumes necessary to comprehend the eleventh census will be twenty-five, and they will contain 25,379 printed pages. The assurance is confidently made that before the close of the present calendar year the material still incomplete will be practically in hand, and the census can certainly be closed by March 4, 1895. After that the revision and proof reading necessary to bring out the volumes will still be required.

The text of the census volumes has been limited, as far as possible, to the analysis of the statistics presented. This method, which is in accordance with law, has caused more or less friction, and in some instances individual disappointment, for when the Commissioner of Labor took charge of the work he found much matter on hand which according to this rule he was compelled to discard. The census is being prepared according to the theory that it is designed to collect facts and certify them to the public, not to elaborate arguments or to present personal views.

The Secretary of Agriculture in his report reviews the operations of his department for the last fiscal year, and makes recommendations for the further extension of its usefulness. He reports a saving in expenditures during the year of \$200,000, which is covered back into the Treasury. This sum is 22 per cent of the entire appropriation.

A special study has been made of the demand for American farm products in all foreign markets, especially Great Britain. That country received from the United States during the nine months ending Sept. 30, 1894, 255,510 live beef cattle, valued at \$24,500,000, as against 150,611 cattle, valued at \$16,634,000, during the same period for 1893.

During the first six months of 1894 the United Kingdom took also 112,000,000 pounds of dressed beef from the United States, valued at nearly \$10,000,000.

The report shows that during the nine months immediately preceding Sept. 30, 1894, the United States exported to Great Britain 224,750,000 pounds of pork; of apples, 1,300,000 bushels, valued at \$1,300,000; and of horses, 2,811, at an average value of \$130 per head. There was a falling off in American wheat exports of 15,000,000 bushels, and the Secretary is inclined to believe that wheat may not in the future be the staple export rural product of our country, but that corn will continue to advance in importance as an export on account of the new uses to which it is constantly being appropriated.

The exports of agricultural products from the United States for the fiscal year ending June 30, 1894, amounted to \$29,562,186, being 17 1/2 per cent of American exports of every description, and the United Kingdom of Great Britain took more than 54 per cent of all farm products finding foreign markets.

The Department of Agriculture has undertaken during the year two new and important lines of research.

The first relates to grasses and forage plants, with the purpose of instructing and familiarizing the people as to the distinctive grasses of the United States and teaching them how to introduce valuable foreign forage plants which may be adapted to this country. The second relates to agricultural soils and crop production, involving the analysis of samples of soils from all sections of the American Union, to demonstrate their adaptability to particular plants and crops. Mechanical analysis of soils may be of such inestimable utility that it is foremost in the new lines of agricultural research, and the Secretary therefore recommends that a division having it in charge be permanently established in the department.

The amount appropriated for the Weather Bureau was \$351,100. Of that sum \$133,500, or 14 per cent., has been saved and is returned to the Treasury.

As illustrating the usefulness of this service, it may be here stated that the warnings which were very generally given of two tropical storms occurring in September and October of the present year resulted in detaining safely in port 2,305 vessels, valued at \$36,253,912, laden with cargoes of probably still greater value. What is much more important and gratifying, many human lives on these ships were also undoubtedly saved.

The appropriation to the Bureau of Animal Industry was \$850,000, and the expenditures for the year were only \$495,429.24, thus leaving unexpended \$354,570.76. The inspection of beef animals for export and interstate trade has been continued, and 12,944,056 head were inspected during the year, at a cost of 1¢ cent per head, against 4¢ cents for 1893. The amount of pork microscopically examined was 25,457,937 pounds, against 20,677,410 pounds in the preceding year. The cost of this inspection has been diminished from 64 cents per head in 1893 to 6¢ cents in 1894.

The expense of inspecting the pork sold in 1894 to Germany and France by the United States was \$88,922.10. The quantity inspected was greater by 15,000,000 pounds than during the preceding year, when the cost of such inspection was \$172,567.08. The Secretary of Agriculture recommends that the law providing for the microscopic inspection of export and interstate meat be so amended as to compel owners of the meat inspected to pay the cost of such inspection, and I call attention to the arguments presented in his report in support of this recommendation.

The live beef cattle exported and tagged during the year numbered 303,535. This is an increase of 69,533 head over the previous year.

The sanitary inspection of cattle shipped to Europe has cost an average of 10¢ cents for each animal, and the cost of inspecting Southern cattle and the disinfection of cars and stock yards averages 27 cents per animal.

The scientific inquiries of the Bureau of Animal Industry have progressed steadily during the year. Much tuberculin and mallein have been furnished to State authorities for use in the agricultural colleges and experiment stations for the treatment of tuberculosis and glanders.

Quite recently this department has published the results of its investigations of bovine tuberculosis, and its researches will be vigorously continued. Certain herds in the District of Columbia will be thoroughly inspected, and will probably supply adequate scope for the department to intelligently prosecute its scientific work and furnish sufficient material for purposes of illustration, description, and definition.

The sterilization of milk suspected of containing the bacilli of tuberculosis has been during the year very thoroughly explained in a leaflet by Dr. D. E. Salmon, the chief of the bureau, and given general circulation throughout the country.

The Office of Experiment Stations, which is a part of the United States Department of Agriculture, has during the past year engaged itself almost wholly in preparing for publication works based upon the re-

ports of agricultural experiment stations and other institutions for agricultural inquiry in the United States and foreign countries.

The Secretary, in his report for 1893, called attention to the fact that the appropriations made for the support of the experiment stations throughout the Union were the only moneys taken out of the national Treasury by act of Congress for which no accounting to Federal authorities was required. Responding to this suggestion, the Fifty-third Congress, in making the appropriation for the department for the present fiscal year, provided that

"The Secretary of Agriculture shall prescribe the form of annual financial statement required by section 3 of said act of March 2, 1887; shall ascertain whether the expenditures under the appropriation hereby made are in accordance with the provisions of said act, and shall make report thereon to Congress."

In obedience to this law the Department of Agriculture immediately sent out blank forms of expense accounts to each station, and proposes, in addition, to make, through trusted experts, systematic examination of the several stations during each year, for the purpose of acquiring by personal investigation the detailed information necessary to enable the Secretary of Agriculture to make, as the statute provides, a satisfactory report to Congress. The boards of management of the several stations, with great alacrity and cordiality, have approved the amendment to the law providing this supervision of their expenditures, anticipating that it will increase the efficiency of the stations and protect their directors and managers from loose charges concerning their use of public funds, besides bringing the Department of Agriculture into closer and more confidential relations with the experimental stations, and through their joint service largely increasing their usefulness to the agriculture of the country.

Acting upon a recommendation contained in the report of 1893, Congress appropriated \$10,000 "to enable the Secretary of Agriculture to investigate and report upon the nutritive value of the various articles and commodities used for human food, with special suggestion of full, wholesome, and edible rations less wasteful and more economical than those in common use."

Under this appropriation the department has prepared and now has nearly ready for distribution an elementary discussion of the nutritive value and pecuniary economy of food. When we consider that fully one half of all the money earned by the wage earners of the civilized world is expended by them for food, the importance and utility of such an investigation is apparent.

The department expended in the fiscal year 1893 \$2,354,809.56; and out of that sum the total amount expended in scientific research was 45.6 per cent. But in the year ending June 30, 1894, out of a total expenditure of \$1,948,988.38, the department applied 51.3 per cent. of that sum to scientific work and investigation. It is therefore very plainly observable that the economies which have been practiced in the administration of the department have not been at the expense of scientific research.

The recommendation contained in the report of the Secretary for 1893 that the vicious system of promiscuous free distribution of its departmental documents be abandoned is again urged. These publications may well be furnished without cost to public libraries, educational institutions, and the officers and libraries of States and of the Federal Government. But from all individuals applying for them a price covering the cost of the document asked for should be required. Thus the publications and documents would be secured by those who really desire them for proper purposes. Half a million of copies of the report of the Secretary of Agriculture are printed for distribution at an annual cost of about \$300,000. Large numbers of them are cumbering storerooms at the Capitol and the shelves of second-hand bookstores throughout the country. All this

labor and waste might be avoided if the recommendations of the Secretary were adopted.

The Secretary also again recommends that the gratuitous distribution of seeds cease, and that no money be appropriated for that purpose except to experimental stations. He reiterates the reasons given in his report for the discontinuance of this unjustifiable practice, and I fully concur in the conclusions which he has reached.

The best service of the statisticians of the Department of Agriculture is the ascertainment, by diligence and care, of the actual and real conditions, favorable or unfavorable, of the farmers and farms of the country, and to seek the means which produce those conditions, to the end that the facts ascertained may guide their intelligent treatment.

A further important utility in agricultural statistics is found in their ascertainment of the relation of the supply of farm products to the demand for them in the markets of the United States and of the world.

It is deemed possible that an agricultural census may be taken each year through the agents of the statistical division of the department. Such a census is recommended for trial by the chief of that division. Its scope would be:

- (1) The area under each of the more important crops.
- (2) The aggregate products of each of such crops.
- (3) The quantity of wheat and corn in the hands of farmers at a date after the spring sowings and plantings and before the beginning of harvest; and also the quantity of cotton and tobacco remaining in the hands of planters either at the same date or at some other designated time.

The cost of the work is estimated at \$200,000. Owing to the peculiar quality of the statistician's work, and the natural and acquired fitness necessary to its successful prosecution, the Secretary of Agriculture expresses the opinion that every person employed in gathering statistics under the chief of that division should be admitted to that service only after a thorough, exhaustive, and successful examination at the hands of the United States Civil Service Commission. This has led him to call for such examination of candidates for the position of assistant statisticians, and also of candidates for chiefs of sections in that division.

The work done by the Department of Agriculture is very superficially dealt with in this communication, and I commend the report of the Secretary and the very important interests with which it deals to the careful attention of the Congress.

The advantages to the public service of an adherence to the principles of civil-service reform are constantly more apparent; and nothing is so encouraging to those in official life who honestly desire good government as the increasing appreciation by our people of these advantages. A vast majority of the voters of the land are ready to insist that the time and attention of those they select to perform for them important public duties should not be distracted by doing out minor offices, and they are growing to be unanimous in regarding party organization as something that should be used in establishing party principles instead of dictating the distribution of public places as rewards of partisan activity.

Numerous additional offices and places have lately been brought within civil-service rules and regulations, and some others will probably soon be included.

The report of the commissioners will be submitted to the Congress, and I invite careful attention to the recommendations it contains.

I am entirely convinced that we ought not to be longer without a national board of health or national health officer charged with no other duties than such as pertain to the protection of our country from the invasion of pestilence and disease. This would involve the establishment, by such board or officer, of proper quarantine precautions, or the necessary aid and counsel to local authorities on the subject, prompt

advice and assistance to local boards of health or health officers in the suppression of contagious diseases, and in cases where there are no such local boards or officers, the immediate direction by the national board or officer of measures of suppression, consistent and authentic information concerning the health of foreign countries and all parts of our own country as related to contagious diseases, and consideration of regulations to be enforced in foreign ports to prevent the introduction of contagion into our cities and the measures which should be adopted to secure their enforcement.

There seems to be at this time a decided inclination to discuss measures of protection against contagious diseases in international conference with a view of adopting means of mutual sanitation. The creation of such a national health establishment would greatly aid our standing in such conferences and improve our opportunities to avail ourselves of their benefits.

I earnestly recommend the inauguration of a national board of health or similar national instrumentality, believing the same to be a needed protection against contagious diseases and in the interest of the safety and health of our people.

By virtue of a statute of the United States passed in 1881 appointed in July last Hon. John D. Kenson, of the State of New York, and Hon. Nicholas E. Worthington, of the State of Illinois, to form, with Hon. Carroll D. Wright, Commissioner of Labor, who was designated by said statute, a commission for the purpose of making careful inquiry into the causes of the controversies between certain railroads and their employes, which had resulted in an extensive and destructive strike, accompanied by much violence and dangerous disturbance, with considerable loss of life and great destruction of property.

The report of the commission has been submitted to me, and will be transmitted to the Congress, with the evidence taken upon their investigation.

Their work has been well done, and their standing and intelligence give assurance that the report and suggestions they make are worthy of careful consideration.

The tariff act passed at the last session of the Congress needs important amendments if it is to be executed effectively and with certainty. In addition to such necessary amendments as will not change rates of duty, I am still very decidedly in favor of putting coal and iron upon the free list.

So far as the sugar schedule is concerned, I would be glad, under existing aggravations, to see every particle of differential duty in favor of refined sugar stricken out of our tariff law. If with all this favor now accorded the sugar-refining interest in our tariff laws it still languishes in the extent of closed refineries and thousands of discharged workmen, it would seem to present a hopeless case for reasonable legislative aid. Whatever else is done or omitted, I earnestly repeat here the recommendation I have made in another portion of this communication, that the additional duty of one tenth of a cent per pound laid upon sugar imported from countries paying a bounty on its export be abrogated. It seems to me that exceedingly important considerations point to the propriety of this amendment.

With the advent of a new tariff policy not only calculated to relieve the consumers of our land in the cost of their daily life, but to invite a better development of American thrift and create for us closer and more profitable commercial relations with the rest of the world, it follows as a logical and imperative necessity that we should at once remove the chief, if not the only, obstacle which has so long prevented our participation in the foreign carrying trade of the sea. A tariff built upon the theory that it is well to check imports and that a home market should bound the industry and effort of American producers was fitly supplemented by a refusal to allow American registry to vessels built abroad though owned and navigated by our people, thus exhibiting a willingness to abandon all contest for the advantages of

American transoceanic carriage. Our new tariff policy, built upon the theory that it is well to encourage such importations as our people need, and that our products and manufactures should find markets in every part of the habitable globe, is consistently supplemented by the greatest possible liberty to our citizens in the ownership and navigation of ships in which our products and manufactures may be transported. The millions now paid to foreigners for carrying American passengers and products across the sea should be turned into American hands. Ship-building, which has been protected to stragulation, should be revived by the prospect of profitable employment for ships when built, and the American sailor should be resurrected and again take his place—a sturdy and industrious citizen in time of peace and a patriotic and safe defender of American interests in the day of conflict.

The ancient provision of our law denying American registry to ships built abroad and owned by Americans appears in the light of present conditions not only to be a failure for good at every point, but to be nearer a relic of barbarism than anything that exists under the permission of a statute of the United States. I earnestly recommend its prompt repeal.

During the last month the gold reserve in the Treasury for the purpose of redeeming the notes of the Government circulating as money in the hands of the people became so reduced, and its further depletion in the near future seemed so certain, that in the exercise of proper care for the public welfare it became necessary to replenish this reserve, and thus maintain popular faith in the ability and determination of the Government to meet, as agreed, its pecuniary obligations.

It would have been well if in this emergency authority had existed to issue the bonds of the Government bearing a low rate of interest and maturing within a short period; but the Congress having failed to confer such authority, resort was necessarily had to the resumption act of 1875, and pursuant to its provisions bonds were issued drawing interest at the rate of 5 per cent. per annum and maturing ten years after their issue, that being the shortest time authorized by the act. I am glad to say, however, that on the sale of these bonds the premium received operated to reduce the rate of interest to be paid by the Government to less than 3 per cent.

Nothing could be worse or further removed from sensible finance than the relations existing between the currency the Government has issued, the gold held for its redemption, and the means which must be resorted to for the purpose of replenishing such redemption fund when impaired. Even if the claims upon this fund were confined to the obligations originally intended, and if the redemption of these obligations meant their cancellation, the fund would be very small. But these obligations when received and redeemed in gold are not canceled, but are reissued, and may do duty many times by way of drawing gold from the Treasury. Thus we have an endless chain in operation constantly depleting the Treasury's gold and never near a final rest. As if this was not bad enough, we have, by a statutory declaration that it is the policy of the Government to maintain the parity between gold and silver, aided the force and momentum of this exhausting process and added largely to the currency obligations claiming this peculiar gold redemption. Our small gold reserve is thus subject to drain from every side. The demands that increase our danger also increase the necessity of protecting this reserve against depletion, and it is most unsatisfactory to know that the protection afforded is only a temporary palliation.

It is perfectly and palpably plain that the only way under present conditions by which this reserve when dangerously depleted can be replenished is through the issue and sale of the bonds of the Government for gold; and yet Congress has not only thus far declined to authorize the issue of bonds best suited to such a purpose, but there seems a disposition in some quar-

ters to deny both the necessity and power for the issue of bonds at all.

I can not for a moment believe that any of our citizens are deliberately willing that their Government should default in its pecuniary obligations or that its financial operations should be reduced to a silver basis. At any rate, I should not feel that my duty was done if I omitted any effort I could make to avert such a calamity. As long, therefore, as no provision is made for the final redemption or the putting aside of the currency obligation now used to repeatedly and constantly draw from the Government its gold, and as long as no better authority for bond issues is allowed than at present exists, such authority will be utilized whenever and as often as it becomes necessary to maintain a sufficient gold reserve, and in abundant time to save the credit of our country and make good the financial declarations of our Government.

Questions relating to our banks and currency are closely connected with the subject just referred to, and they also present some unsatisfactory features. Prominent among them are the lack of elasticity in our currency circulation, and its frequent concentration in financial centers when it is most needed in other parts of the country.

The absolute divorcement of the Government from the business of banking is the ideal relationship of the Government to the circulation of the currency of the country.

This condition can not be immediately reached; but as a step in that direction and as a means of securing a more elastic currency and obviating other objections to the present arrangement of bank circulation, the Secretary of the Treasury presents in his report a scheme modifying present banking laws and providing for the issue of circulating notes by State banks free from taxation under certain limitations.

The Secretary explains his plan so plainly, and its advantages are developed by him with such remarkable clearness, that any effort on my part to present argument in its support would be superfluous. I shall therefore content myself with an unqualified indorsement of the Secretary's proposed changes in the law and a brief and imperfect statement of their prominent features.

It is proposed to repeal all laws providing for the deposit of United States bonds as security for circulation; to permit national banks to issue circulating notes not exceeding in amount 75 per cent. of their paid-up and unimpaired capital, provided they deposit with the Government, as a guarantee fund, in United States legal-tender notes, including Treasury notes of 1890, a sum equal in amount to 30 per cent. of the notes they desire to issue, this deposit to be maintained at all times, but whenever any bank retires any part of its circulation a proportional part of its guarantee fund shall be returned to it; to permit the Secretary of the Treasury to prepare and keep on hand ready for issue in case an increase in circulation is desired blank national bank notes for each bank having circulation and to repeal the provisions of the present law imposing limitations and restrictions upon banks desiring to reduce or increase their circulation—thus permitting such increase or reduction within the limit of 75 per cent. of capital to be quickly made as emergencies arise.

In addition to the guarantee fund required it is proposed to provide a safety fund for the immediate redemption of the circulating notes of failed banks, by imposing a small annual tax, say, one half of 1 per cent., upon the average circulation of each bank until the fund amounts to 5 per cent. of the total circulation outstanding. When a bank fails its guarantee fund is to be paid into this safety fund and its notes are to be redeemed in the first instance from such safety fund thus augmented—any impairment of such fund caused thereby to be made good from the immediately available cash assets of said bank, and if these should be insufficient, such impairment to be made good by *pro rata* assessment among the other banks, their contributions constituting a first lien upon the

assets of the failed bank in favor of the contracting banks. As a further security it is contemplated that the existing provision fixing the individual liability of stockholders is to be retained and the bank's indebtedness on account of its circulating notes is to be made a first lien on all its assets.

For the purpose of meeting the expense of printing notes, official supervision, cancellation, and other like charges, there shall be imposed a tax of, say, one half of 1 per cent. per annum upon the average amount of notes in circulation.

It is further provided that there shall be no national bank notes issued of a less denomination than \$10; that each national bank, except in case of a failed bank, shall redeem or retire its notes in the first instance at its own office or at agencies to be designated by it, and that no fixed reserve need be maintained on account of deposits.

Another very important feature of this plan is the exemption of state banks from taxation by the United States in cases where it is shown to the satisfaction of the Secretary of the Treasury and Comptroller of the Currency by banks claiming such exemption that they have not had outstanding their circulating notes exceeding 75 per cent. of their paid-up and unimpaired capital; that their stockholders are individually liable for the redemption of their circulating notes to the full extent of their ownership of stock; that the liability of said banks upon their circulating notes constitutes under their State law a first lien upon their assets; that such banks have kept and maintained a guarantee fund in United States legal-tender notes, including Treasury notes of 1890, equal to 30 per cent. of their outstanding circulating notes, and that such banks have promptly redeemed their circulating notes when presented at their principal or branch offices.

It is quite likely that this scheme may be usefully amended in some of its details; but I am satisfied it furnishes a basis for a very great improvement in our present banking and currency system.

I conclude this communication fully appreciating that the responsibility for all legislation affecting the people of the United States rests upon their representatives in the Congress, and assuring them that, whether in accordance with recommendations I have made or not, I shall be glad to co-operate in perfecting any legislation that tends to the prosperity and welfare of our country.

GROVER CLEVELAND.

EXECUTIVE MANSION, Dec. 3, 1895.

The Currency.—The most important subject that occupied the attention of the Congress at this session was the scheme proposed for a change in the currency system. The President in his message spoke of a plan proposed by the Secretary of the Treasury in his report, "modifying present banking laws and providing for the issue of circulating notes by State banks free from taxation under certain limitations"; and he outlined the main features of the scheme, giving it his approval. Mr. Carlisle embodied his views in a measure which was introduced in the House of Representatives by Mr. Springer, of Illinois, referred to the Committee on Banking and Currency, and reported from that body Dec. 17, 1894. The measure as reported was as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That all acts and parts of acts which require or authorize the deposit of United States bonds to secure circulating notes issued by national banking associations be, and the same are hereby, repealed, and such notes hereafter prepared shall not contain the statement that they are so secured.

Sec. 2. That any national banking association organized as now provided by law, and any national banking association hereafter organized, may take out

circulating notes to an amount not exceeding 75 per cent. of its paid-up and unimpaired capital, upon depositing with the Treasurer of the United States United States legal-tender notes, including Treasury notes issued under the act approved July 14, 1890, entitled "An Act directing the purchase of silver bullion and the issue of Treasury notes thereon, and for other purposes," as a guarantee fund equal to 30 per cent. of the circulating notes applied for. The association making such deposit shall be entitled to receive from the Comptroller of the Currency circulating notes in denominations of \$10 and multiples thereof in blank, registered and countersigned, as provided by law, and all such notes, together with the circulating notes of national banking associations now outstanding, shall constitute, and are hereby declared to be, a first lien upon all the assets of the association making the same.

All circulating notes hereafter furnished to national banking associations shall be uniform in design, but any association desiring to redeem its circulating notes in gold may have them made payable in that coin; and the Secretary of the Treasury is hereby authorized and directed to have prepared and keep on hand, ready for delivery on application, a reserve of blank notes for such national banking association having circulation, but such reserve for each bank shall at no time be in excess of the difference between the amount of its notes then outstanding and the total amount which it is by this act authorized to receive.

Sec. 3. That in lieu of all existing taxes such national banking association shall pay to the Treasurer of the United States, in the months of January and July of each year, a duty of one fourth of 1 per cent. for each half year upon the average amount of its notes in circulation; and in computing such average all notes issued by such association and not actually retired from circulation in the manner hereinafter provided shall be included.

Sec. 4. That each national banking association shall redeem its notes at par on presentation at its own office and at such agencies as may be designated by it for that purpose, and whenever such association desires to retire the whole or any part of its circulation the notes to be retired shall be forwarded to the Comptroller of the Currency for cancellation, and thereupon 30 per cent. of the amount of such canceled notes shall be returned to the association. Defaced and mutilated notes and notes otherwise unfit for circulation, which have been redeemed by any association, may be returned to the Comptroller of the Currency for destruction and release, as now provided by law.

Sec. 5. That in order to provide a safety fund for the prompt redemption of the circulating notes of failed national banking associations, each such association now organized, or hereafter organized, shall pay to the Treasurer of the United States, in the months of January and July in each year, a tax of one fourth of 1 per cent. for each half year upon the average amount of its circulating notes outstanding, to be computed as hereinafter provided, until the said fund amounts to a sum equal to 5 per cent. upon the total amount of national bank notes outstanding, and thereafter said tax shall cease.

Each association hereafter organized, and each association applying for additional circulation, shall pay its pro rata share into the said fund before receiving notes; but an association retiring or reducing its circulation shall not be entitled to withdraw any part of said fund. When a national banking association becomes insolvent its guarantee fund held on deposit shall be transferred to the safety fund herein provided for, and applied to the redemption of its outstanding notes; and in case the said last-mentioned fund should at any time be impaired by the redemption of the notes of failed national banks, and the immediately available assets of said banks are not sufficient to reimburse it, said fund shall be at once restored by pro rata assessments upon all the other associations

according to the amount of their outstanding circulation, and the association so assessed shall have a first lien upon the assets of each failed bank for the amount properly chargeable to such bank on account of the redemption of its circulation.

SEC. 6. That the Secretary of the Treasury may from time to time invest any money belonging to the safety fund in United States bonds, and the bonds so purchased, and the interest accruing thereon, shall be held as part of the said fund. Such bonds may be sold when necessary and the proceeds used for the redemption of the circulating notes of failed national banks.

SEC. 7. That every national banking association heretofore organized and having bonds on deposit to secure circulation shall, on or before the 1st day of July, 1893, withdraw such bonds and deposit with the Treasurer of the United States a guarantee fund consisting of United States legal-tender notes, including the Treasury notes issued under the act of July 14, 1890, equal to 30 per cent. of its outstanding circulation at the time of such withdrawal and deposit, and all laws and parts of laws requiring such association to deposit, or to keep on deposit, with the Treasurer of the United States bonds of the United States for any purpose other than as security for public moneys, shall be, and are hereby, repealed from and after the said date.

SEC. 8. That sections 9 and 12 of the act approved July 12, 1882, entitled "An Act to enable national banking associations to extend their corporate existence, and for other purposes," and section 31 of the act approved June 3, 1864, entitled "An Act to provide a national currency secured by a pledge of United States bonds, and to provide for the circulation and redemption thereof," and all acts and parts of acts amendatory thereof be, and the same are hereby, repealed.

SEC. 9. That the Secretary of the Treasury may, in his discretion, use from time to time any surplus revenue of the United States in the redemption and retirement of United States legal-tender notes, but the amount of such notes retired shall not in the aggregate exceed an amount equal to 70 per cent. of the additional circulation taken out by national banks and State banks under the provisions of this act; and hereafter no United States notes, or Treasury notes authorized by the act of July 14, 1890, entitled "An Act directing the purchase of silver bullion and the issue of Treasury notes thereon, and for other purposes," of a less denomination than \$10 shall be issued, and as rapidly as such notes of denominations less than \$10 shall be received into the Treasury they shall be canceled and an equal amount of notes of like character, but in denominations of \$10 or multiples thereof, shall be issued in their places, but nothing in this act shall be so construed as to repeal or in any manner affect the second section of the said act of July 14, 1890.

SEC. 10. That the use of circulating notes issued by a banking corporation duly organized under the laws of any State, and which transacts no other than a banking business, shall be exempt from taxation under the laws of the United States when it is shown to the satisfaction of the Secretary of the Treasury and the Comptroller of the Currency

(1) That such bank has at no time had outstanding its circulating notes in excess of 75 per cent. of its paid-up and unimpaired capital.

(2) That its stockholders are individually liable for the redemption of its circulating notes to the full extent of their ownership of stock; but this shall not be required in the case of persons holding stock as executors, administrators, guardians, or trustees, if the assets and funds in their hands are liable in like manner and to the same extent as the testator, intestate, ward, or person interested in such funds would be if living and competent to act and hold the stock in his own name.

(3) That the circulating notes constitute by law a first lien upon all the assets of the bank.

(4) That the bank has at all times kept on deposit with an official of the State authorized by law to receive and hold the same, a guarantee fund in United States legal-tender notes, including Treasury notes of 1890, equal to 30 per cent. of its outstanding circulating notes; and

(5) That it has promptly redeemed its notes at par on demand at its principal office, or at one or more of its branch offices, if it has branches.

SEC. 11. That the Secretary of the Treasury may, under proper rules and regulations to be established by him, permit State banks to procure and use in the preparation of their notes the distinctive paper used in printing United States securities; but no State bank shall print or engrave its notes in similitude of a United States note, or certificate, or national bank note.

The Carlisle bill was entitled "An Act to amend the laws relating to national banking associations, to exempt the notes of State banks from taxation upon certain conditions, and for other purposes." In explanation of the measure, Mr. Springer said:

"The Comptroller of the Currency, in his report to Congress, dated Dec. 3, 1894, on page 27, submits a table showing the number of depositors in national, State, and private banks, loan and trust companies, and savings banks in the United States on Oct. 31 last. This statement shows that there were 8,143,000 persons in the United States who kept accounts in all our banks. The same statement also shows that the deposits made by these persons amounted to \$4,220,000,000.

"On page 12 of the Comptroller's report is given a statement of the capital stock of the national and State banks in the United States, which aggregates \$1,069,000,000. The total banking funds of all the banks in the United States, embracing capital stock, surplus, undivided profits, and deposits in national and other banks amounted to \$6,407,000,000.

"These statements, Mr. Chairman, will serve to illustrate the great importance and the universal interest manifested in the subject now before this committee.

"The Committee on Banking and Currency, which has recommended the passage of the pending bill and has asked for its immediate consideration by this committee and by this House, has been giving the question careful consideration ever since the appointment of the committee by the Speaker of this House in August, 1893. It is not a sudden and unconsidered conclusion to which we have arrived, therefore, but the most careful deliberation has been given to this great subject.

"Since the message of the President of the United States and the report of the Secretary of the Treasury to this Congress at its present session the committee have had hearings and invited before them prominent bankers and financiers from every part of the country. The statements of these gentlemen are printed and before the members of this House. We have deemed it best to report a bill for the consideration of the House, and we ask this committee to enter upon its consideration soberly, candidly, and with the sole view to the promotion of the best interests of our common country.

"This bill does not represent the individual views of any member of the committee, or perhaps of any member of this House, in its entirety.

It is a compromise bill, a measure which, as it is believed, comes nearer to representing the average of sentiment on this subject than any other that has been proposed, and we ask its consideration, not because each member of the committee would have prepared it exactly in that way, but because we believe that is the best we can do under the circumstances, and we believe it is a step, and a great step, in the right direction, a step toward better conditions and toward a reform in our financial system that will give greater stability and greater confidence in this country and throughout the world.

"The present national banking law requires that banks desiring to take out circulation shall deposit with the Treasurer of the United States bonds of the United States, and currency may be issued upon these bonds to 90 per cent. of the par value of the bonds. Our bonds are now worth a premium of 17. If the banks are required to pay \$117 for the bonds, and only get \$90 in return in the shape of currency, the conditions are now such that the issuance of national bank currency is no longer profitable, and there is a continual shrinkage in the national bank currency, which has been going on for a number of years. On the 1st day of November, 1894, the amount of national bank notes in circulation was only \$202,000,000.

"At that time, I may state, the total circulating medium of the United States outside of the Treasury, including gold coin and standard silver dollars, was \$1,672,000,000. The experience of other countries and the best judgment in this country has now reached the conclusion that a bond security is no longer necessary in order to secure bank circulation. At the last session I introduced a bill which provided for receiving deposits of State, county, and municipal bonds, as well as national bonds. But there was this objection to that measure, that nearly all such bonds were held in the East or abroad, and that they were not available in localities where currency was scarce as security for bank circulation.

"The pending bill does not require a deposit of United States bonds nor any other interest-bearing obligation in order to make proper security for the circulating notes.

"It is conceded on all hands, and your committee have taken this subject under the most careful consideration, that there should be no circulating medium issuing from the banks of the country that is not absolutely safe, not only safe in times when everything is flourishing and prosperous, but safe at all times; in time of panics, in time of commercial disaster, at every hour of the day; that the bill shall be paid upon presentation at its face value.

"A great many United States bonds are held in trust capacities and can not be reached for the purpose of being used as a deposit to secure circulation.

"In lieu of the security heretofore required for circulating notes your committee have recommended the following provisions:

First. A guarantee fund consisting of Treasury notes, including the notes issued under the act of Congress approved July 14, 1890, equal to 30 per cent. of the circulating notes applied for.

Second. A safety fund, which will amount when it

reaches its maximum to 5 per cent. upon the total amount of national bank notes outstanding.

Third. A first lien upon all the assets of the association bearing the name.

In case the guarantee and safety funds and the assets of the failed bank are not sufficient to redeem the notes of such bank, a *pro rata* assessment upon all the other banking associations, according to the amount of their outstanding circulation, is to be made by the Treasury Department, and the banks so assessed shall have a first lien upon the assets of each failed bank for the amount properly chargeable to such bank on account of the redemption of its circulation.

"In addition to this the stockholders, as now provided by law, are liable to an amount equal to the value of the amount of the stock which they hold in the bank. Out of the assets of the bank, out of the amount received from the personal-liability clause, from the safety fund and the guarantee fund the notes of any failed bank can be paid.

"I desire to call attention to a few facts which will show conclusively that this provision is ample for securing the notes of the banks under all conditions. The bill limits the amount of notes which any bank may take out at 75 per cent. of the capital stock of the bank. The whole amount of the capital stock of all the national banks at this time is \$672,000,000; and if all the banks in the United States should take out all the currency to which they are entitled under this bill the whole circulating bank currency would amount to \$504,000,000.

"The 5-per-cent. safety fund upon this circulation would amount to \$25,000,000, and the guarantee fund which is required to be deposited in the Treasury of the United States by each bank, amounting to 30 per cent. upon the circulation applied for, would amount to \$151,000,000. The resources of all the national banks, which are ultimately and remotely responsible for the circulation of every bank that fails, amounted on Oct. 31 to \$3,473,000,000. Upon a possible circulation of \$504,000,000 there would be an available guarantee fund in the Treasury of \$151,000,000, a safety fund of \$25,000,000, and an ultimate fund out of which the notes of any failed bank could be paid amounting to \$3,473,000,000.

"During the financial crisis of 1893 135 national banks suspended, having a capital stock of \$30,000,000. If at that time all of the national banks in the United States had taken out all the circulation to which they would be entitled under this bill if it had then been in force, and if all the banks that suspended had also taken out the full amount of circulation to which they would have been entitled, their circulation would have amounted to \$22,762,000. The 30 per cent. which the banks that suspended would have deposited would have been first applied to the payment of these notes. This would have left \$15,994,000 of circulating notes to be paid out of the safety fund, which, as before stated, would have amounted to \$25,000,000.

"These facts show conclusively that if the proposed bill had been in force during the crisis of 1893, and if all the banks had then taken out circulation to the maximum allowed by the law and if the suspended banks had also taken out their maximum amount of circulation, the guarantee and safety fund would have been ample

for the payment of the entire outstanding notes of the suspended banks, and there would have been a surplus of over \$11,000,000 still in the safety fund.

"But of the 158 banks that suspended 86 resumed payment within a short period, and there was no loss in those cases either to the bill holders or to the depositors. There were only 65 national banks that went into the hands of receivers during that crisis, and they had a capital stock of \$10,935,000. If we assume that the notes of those 65 banks only were to be paid out of the guarantee and safety fund, then there would have been only \$8,200,000 of outstanding notes of all the banks which passed into the hands of receivers even if they had all taken out their maximum amounts. The 30-per-cent. guarantee fund would have paid \$2,460,000 of those notes, which would have left only \$4,100,000 to be paid out of the 5-per-cent. safety fund.

"But all of those banks had available assets, and the stockholders were individually liable to amounts equal to their stock, so that here was an additional fund out of which the notes could have been paid. The unavailable assets could have been realized on in the end, and that, with the liability of the stockholders, would have yielded a considerable additional sum. If it should be assumed that all the national banks which were in existence on Oct. 31 last were organized under the proposed law, and that all of them in a great financial crisis had failed, and if it should be assumed that all of them had taken out, under the pending bill, the entire circulation to which they would have been entitled, the condition would have been as follows: The circulation would have amounted to \$504,000,000. The guarantee and safety fund would have amounted to \$176,000,000. That would leave \$328,000,000 of circulating notes the payment of which would be secured and paid by a *pro rata* assessment from the resources of all the national banks in the United States.

"These resources, as I have before stated, amounted on Oct. 1 last to \$3,473,000,000. The amount of the notes, it will be seen, would not equal 10 per cent. of the fund out of which they could be paid. This does not include the fund which would be derived from the personal liability of the stockholders. In view of these facts it seems to me conclusive that under the proposed bill, even in a great crisis such as that which swept over the country in 1893, there could be no possible loss to any person who had in his possession a bill issued by a national bank under the provisions of this proposed law.

"Objection has been made in some quarters to the provision of the bill requiring the Secretary of the Treasury to levy a *pro rata* assessment upon all the banks in the system for the purpose of making good any deficit that there may be in the available assets of the bank and in the guarantee and safety funds for the payment of the notes of a failed bank. It has been stated that the national banks of the United States will not take out circulation under this provision. I do not believe it. The national bankers met in convention in Baltimore last October and formulated a bill which carried out their wishes in regard to a national-bank system.

"The bill formulated by that convention is known as the Baltimore plan, and it differs from the plan submitted by your committee in requiring that the Government of the United States, if the safety fund and the available assets of a failed bank should be insufficient to pay the notes of that bank, shall pay the difference out of the Treasury. But I want to call the attention of gentlemen to the fact that there is a provision in the Baltimore plan which authorizes the Government immediately to levy a tax upon the banks for the purpose of making good the funds advanced by the Government for such purpose and for the purpose of making good the safety fund; so that in practical operation the Baltimore plan subjects the banks in this respect to practically the same responsibility as the bill which your committee reports.

"I desire to call attention to another feature of the Baltimore plan. That plan provides first that the redemption fund now required by law shall be deposited in the Treasury, amounting to 5 per cent. of the circulation in each bank. That fund belongs to the bank and is a part of its assets. In addition to that redemption fund, which is to be used for the redemption of the notes of the failed banks—for the purpose of current redemption at the Treasury—there is what is called a guarantee fund provided in the sixth section of this Baltimore plan through the deposit by each bank of 2 per cent. upon the amount of the circulation received by it the first year.

Thereafter impose a tax of one half of 1 per cent. upon the average amount of outstanding circulation, the same to be paid into this fund until it shall equal 5 per cent. of the entire circulation outstanding, when the collection of such tax shall be suspended, to be resumed whenever the Comptroller of the Currency shall deem it necessary.

"This one half of 1 per cent. per annum may be imposed whenever necessary to restore this fund.

The notes of insolvent banks shall be redeemed by the Treasurer of the United States out of the guarantee fund if it shall be sufficient—

"And it is provided previously that the redemption fund shall also be applied for that purpose

if it shall be sufficient, and if not sufficient, then out of any money in the Treasury, the same to be reimbursed to the Treasury out of the "guarantee fund" when replenished either from the assets of the failed banks or from the tax aforesaid.

"There is precisely in effect the same provision in the Baltimore plan for the ultimate liability of all the banks for the notes of any failed bank in the entire system."

Dec. 21, Mr. Springer submitted a substitute for the Carlisle bill. Among the changes of importance was one in section 2, allowing currency certificates issued under section 5193 of the Revised Statutes to be deposited as part of the 30-per-cent. guarantee fund. The closing part of section 5 was amended so as to read as follows:

When a national banking association becomes insolvent its guarantee fund held on deposit shall be transferred to the safety fund herein provided for, and applied to the redemption of its outstanding notes; and in case the said last-mentioned fund should at

any time be impaired by the redemption of the notes of failed national banks, and the immediately available assets of said banks are not sufficient to reimburse it, the collection of said tax of one fourth of 1 per cent. for each half year shall be resumed and continued until the said fund is restored to an amount equal to 2 per cent upon the total circulation outstanding. All circulating notes of failed national banks not redeemed on presentation to the Treasurer of the United States, or an assistant treasurer of the United States, shall bear interest at the rate of 6 per cent. per annum from the date of the suspension of the bank until thirty days after public notice has been given that funds are on hand for their redemption, and such notes shall constitute a first lien upon all moneys thereafter received into the safety fund.

Section 7 was changed altogether so as to read:

Sec. 7. That every national banking association heretofore organized and having bonds on deposit to secure circulation may withdraw such bonds upon the deposit of lawful money of the United States, as now provided by law, and hereafter such association may take out circulation under this act and be entitled to all the rights, privileges, and immunities herein conferred.

In section 8 only so much of the Act of July 12, 1862, as directs deposits of gold and the issue of certificates thereon, was declared repealed. In section 9, the limitation of United States notes and Treasury notes to denominations of \$10 and multiples of that amount was extended to national bank notes. To section 10 the following clause was added:

Whenever the Secretary of the Treasury and the Comptroller of the Currency shall be satisfied that any banking corporation duly organized under the laws of any State, and which transacts no other than a banking business as provided in this section, has been incorporated under the laws of the State in which it is located and that such laws require that its stockholders shall be individually liable for the redemption of its circulating notes to an amount equal to the par value of the capital stock owned by them, and that such laws require that the circulating notes thereof shall constitute a first lien upon all the assets of the bank, and also that such laws require such bank to keep on deposit at all times with an official of the State authorized by law to receive and hold the same a guarantee fund as required in the fourth paragraph of this section, they shall issue to said bank a certificate to that effect. Thereupon said bank may issue its notes as provided in this act, and thereafter the tax of 10 per cent. heretofore imposed by law upon the circulation of the notes of State banks shall not be assessed or collected upon the notes of such bank unless it appears that said bank has issued circulating notes in excess of 75 per cent. of its paid-up and unimpaired capital, or that its capital is impaired and has remained so for thirty days, or that the bank has not kept on deposit with the State official authorized by law to receive and hold the same a guarantee fund as required in the fourth paragraph of this section, or that said bank has not promptly redeemed its notes in lawful money at par on demand at its principal office, or at one or more of its branch offices, if it has branch offices; and that no person or corporation other than the bank issuing such notes in violation of the provisions of this act, shall be liable to the tax of 10 per cent. upon the circulating notes of State banks as now provided by law.

And section 11 was altered as follows:

Sec. 11. That any banking association organized under the laws of any State may deposit with the Treasurer of the United States legal-tender notes and receive certificates therefor, in the manner provided

in section 3190 of the Revised Statutes of the United States, and the Secretary of the Treasury may, under proper rules and regulations to be established by him, permit such banks to procure and use in the preparation of their notes the distinctive paper used in printing United States securities; but no State bank shall print or engrave its notes in similitude of a United States note, or certificate, or national bank note.

Mr. Dingley, of Maine, represented in his discussion of the measure the reasons for Republican opposition. He dwelt on the fact that the source of the financial embarrassment of the Government was lack of revenue, and insisted that no more currency legislation would meet that difficulty. His main point of criticism, however, was the fact that the bill would revive State banks as banks of issue. He said:

"I now come, Mr. Chairman, to the overshadowing objection to this bill, and this is that it revives State banks as banks of issue. It is to me a matter of surprise that after this House, only six months ago, declared by 70 majority against the rehabilitation of State banks as banks of issue, the Secretary of the Treasury should formulate and the majority of the Committee on Banking and Currency should report a banking bill whose central feature provides for exactly that which the House so recently and so emphatically declared it would not tolerate.

"And the excuse given by the chairman of the Banking Committee for this right-about-face, viz., that this bill provides for the rehabilitation of State banks as banks of issue only on conditions which he thinks are entirely satisfactory, only serves to increase my surprise. For if there was one argument against State banks of issue made by him and by others more prominent than any other in the discussion of this question at the last session, it was that after our experience of the great advantages of one uniform national banking system, under national control and national supervision, over two score different State systems, under the divided and discordant control and supervision of as many different States, the country never would consent to go back.

"If the conditions under which the pending bill proposes to rehabilitate State banks as banks of issue make them practically national so far as note issues are concerned, as the gentleman would have us infer, then certainly it would be not only a waste of time, but unwise from any point of view, to attempt to maintain State banks of issue in name when in reality the limitations, restrictions, control, and supervisions of their chief function are to be national. If this were to be the case in fact I am sure that every supporter of the State-bank system would say: 'Better avoid confusion, uncertainty, and conflict of jurisdiction by not undertaking to establish a double-headed system with a State annex in form, when it must be national in reality.'

"But, Mr. Chairman, it is because the conditions proposed are only shadow and not substance that gentlemen who cling to State banks of issue as if they recognized something of State-rights ideas accept them as a realization of their dreams of State sovereignty. Do those conditions contemplate, as to issue functions, national control and national supervision? Nothing of the kind; but, on the contrary, the control and

supervision of 45 States. If it be said that in four respects, viz., the maximum limit of issue, the deposit of a guarantee fund, personal liability of shareholders, and first lien on assets, it is proposed to require that State banks of issue shall conform to the status of national banks as a condition of exemption from the 10-per-cent. tax, I reply that, in the first place, these are only a part of the requirements for national banks, and that, even if they were all, the failure to provide for effective national supervision would make the requirements practically nugatory.

"Practically it would be found impossible to exercise any effective national control over State banks of issue under such legislation as is proposed, as State banks receive their franchises from the several States and are subject to State control and supervision; and even the right of the national Comptroller of the Currency to investigate from time to time the condition of a State bank to ascertain whether the four national conditions of issue have been complied with is left purposely to an uncertain implication, rather than positive provision, of law. Certainly, gentlemen who take the ground, as many friends of State banks do, that the National Government has no right to interfere with State banks of issue, will not be likely to provide hereafter any serious Federal restrictions on the issues of such banks.

"The fact must not be overlooked that the conditions proposed practically offer a premium for even existing national banks to change to State banks of issue, by exempting State banks of issue, not only from the essential but exacting Government supervision, but also from the payment of the general tax of half of 1 per cent. per annum, and also the payment of the special safety-fund tax of the same amount. When it is borne in mind that banking is a business, pursued because of the expectation of profit like other kinds of business, it will be seen that if this bill should become a law there would be serious danger that under the guise of extending the national banking system it would prove to be a potent inducement for its destruction and for the substitution of 45 State-bank systems.

"I do not propose at this time to recall at length the arguments for 1 national- rather than 45 State-bank systems which led this House at the last session by 70 majority to declare against the rehabilitation of State banks as banks of issue in any form. I merely indicate some of the points of these arguments.

"The four essentials of a good bank currency are, first, ultimate safety or payment of issues; second, immediate convertibility into coin or its equivalent; third, uniformity, convenience, and economy; and fourth, elasticity of issue—that is, response of issue to the demands of business.

"The first three of these essentials have been found in the circulation of our national banks as they never have been and never can be found in the circulating notes of 45 different State-bank systems.

"As to ultimate safety, contrast the fact that in thirty years' experience with State systems before the war, according to the Comptroller of the Currency, the losses through the notes of the failed banks averaged one fifth of the aggre-

gate circulation; while not one dollar has been lost by holders of notes of national banks in the thirty years since the national banking system became general.

"As to convertibility, contrast the fact that the notes of State banks were constantly from one half of 1 per cent. to 5 per cent. discount, where they were received at all, outside of the States of issue, with the fact that during the thirty years in which we have had the national system the notes of national banks in Texas or Oregon have been as current at par in Maine or New York as in the States where issued.

"As to uniformity, convenience, and economy, contrast the fact that in the years of our different State systems before the war the diversity of circulating notes made counterfeiting easy, promoted distrust, and limited the usefulness of notes of issue, and the absence of a common control and common regulations and a common tie increased the friction and cost of exchanges; while in the thirty years since the war, under the national system, counterfeiting has been made difficult and the detection of counterfeiters easy—it has been unnecessary for the traveler or business man to consider for a moment whether the national notes which he carried were issued in Vermont or Montana or Mississippi, and has so promoted and economized exchanges that the Comptroller of the Currency estimates a saving of at least \$120,000,000 per annum on bills of exchange alone in the conduct of the business of the country.

"In directions affecting elasticity of issue alone the national system needs amendment to adapt it to changed conditions. When established it was reasonably elastic as to issue, because United States bonds were abundant and obtainable at or below par, so that a profit could be made on note issues which could be loaned. But in progress of time such bonds have become scarce and command a premium, and this, coupled with the fact that the law still permits an issue of only 90 per cent. of the par value of the bonds, has made the issue of circulating notes on such bond security unprofitable, and in making it unprofitable has made it unresponsive to business demands.

"If, instead of devising a bill to rehabilitate State banks of issue, the Committee on Banking and Currency had assumed, what they should have assumed, that any legislation dealing with banks of issue must be on the lines of a uniform national system, under the sole control and constant supervision of the nation, and had proceeded to make such changes in the national system as would have provided reasonable security on the one hand and reasonable elasticity of issue on the other hand, they would have done themselves more credit and the country a real service, even if their work had not resulted in legislation at this session.

"But in bringing into the House a hastily framed bill, which has not even had the benefit of the criticisms and amendments of the members of that committee in the committee room, whose central idea is the rehabilitation of State banks as banks of issue, they have failed to strike the keynote of the legislation which the country expects.

"I can not understand, Mr. Chairman, why it

is that so many of our Southern friends look so favorably upon State banks of issue. If it is because they find the national system requires so excessive security for the issue of circulating notes as to fail to adapt itself to their wants, then I ask, Why not join those who believe in the national system in so modifying the security requirements enacted under different conditions as to make them conform to the present situation? For it must be apparent to every student of finance that a national system in which each bank must receive at par the notes of every other bank in payment of debts due to it—which would be impossible with the notes of State banks—requires less security to make circulating notes safe and convertible than would be necessary under dissimilar State systems.

"It ought to be evident, as the Comptroller of the Currency so clearly shows in his last report, that for this reason, as well as for the reason that there is greater confidence in the intelligence, efficiency, and courage of national supervision than State supervision of bank issues, there is more confidence, not only among the people, but also among capitalists, in national banking institutions than in State banks. Inasmuch as the Southern people rightly regard it as of the greatest importance to them that Northern capital should be attracted to their States, not only for banking purposes, but also for industrial development, it is certainly surprising that their Representatives in Congress should for a moment fall into the error of regarding State banks as more desirable than national banking institutions for that part of the Union, for capital would be much more likely to be attracted to a national than to a State bank.

"If it is because it is thought that State-bank notes will stay at home and not tend, at certain seasons when payments are to be made for supplies and when there is little demand for home loans, to move to commercial centers, then I call attention to the fact that there can be no difference in this respect between a good currency issued by State banks, or by national banks, or even by the nation itself, for the unwritten laws of trade are supreme. The only way that I know of to keep currency at home when there is no demand for it for home business, and when it is required to make payments at the commercial centers, is to make it so poor that nobody outside will take it except at a discount. It is the addled eggs, not the good eggs, that stay at home. If there be any provisions in the laws regulating our national system which improperly act as an inducement for country banks to deposit in reserve cities loanable funds needed at home, as sometimes charged, such provisions may be easily modified. A little reflection ought to satisfy every one that any currency which will not pass beyond the State lines where issued, except at a discount, entails a loss on the people of such State proportioned to the discount to which it is subjected when purchases are to be made outside of State limits.

"I have heard some of our Southern friends say that they wanted a home currency—a currency in which their own people were interested, but I can not understand why a dozen citizens of Georgia, for example, who organize a State bank are any more interested in their people than

when they organize a national bank, or why the issues of a national bank in Charleston are any the less a home currency than the issues of a State bank in the same city.

"Mr. Chairman, the regulation of the currency is a function essentially national, and no State has any more business with it than with the regulation of postal affairs or the regulation of interstate and foreign commerce. Whatever possesses the circulating quality, that is, the quality which causes it to pass on delivery from hand to hand in exchange for valuations—a quality entirely distinct from that possessed by a check or bill of exchange—is money, and as such should be issued under national laws alone and subject alone to national control and supervision. And in saying this, I only repeat what the people of this country have settled beyond recall; and whatever party or whatever men or set of men undertake to settle our currency problem may as well understand first as last that it must be settled on national and not on State lines."

Mr. Bland, of Missouri, protested against the measure in behalf of a portion of the Democracy:

"All your makeshifts are but a fraud and a sham. I believe that the American people will after a while understand this, if they do not now. It may take a few years more of hard times, of grinding poverty, a few more bank failures, to teach them this lesson. And the men who have heretofore enjoyed the profits of this increased value of their securities are to-day becoming very much alarmed on account of the shrinkage of value of the property or wealth on which these securities are resting. Take your railroad securities. Half of your railroads are to-day in the hands of receivers. I do not like to allude to this railroad question just now, and will not do so for the purpose of giving offense to any members of this House.

"You undertook recently to save the railroad monopolies from the effects of the single gold standard by permitting them to pool, to go into trusts. Why was that done? Simply because the shrinkage of the value of their earnings and their securities was bankrupting those corporations, and they came here for relief. All the banking and railroad monopolies and their trusts come here to be saved. The tariff barons and all of them come, each and every one seeking, by means of legislation at the hands of Congress, to escape the crash that is coming in the future, by being made the preferred pets of Congress."

"Mr. Chairman, in the name of an outraged Democracy I protest against the whole proceeding. I have been a Democrat all my life, and expect to live and die one, battling for the principles of that great party. I believe them to be essential to the perpetuity of the republic. I have seen them trampled upon here day by day and month by month. But this House is not the Democratic party. Neither is this Administration the Democratic party. I will appeal from this presence to that vast majority of this country, the great masses of the people, and I hope that there will be a sufficiency of the Democratic party to rally around the great principles of Democracy, therefore, in the coming days and reorganize the party on the principles of Jefferson and Jackson, and go back to the ancient days and landmarks on which the party has

grown and prospered and made this country great and happy.

"I have no sympathy with all of these schemes of monopoly, national banks, and trust monopolies. They do not belong to our system of government. I have no sympathy with the legislation which has been inaugurated in their behalf—railroad pooling, trusts, and monopolies of all kinds. It is true that the House has conformed in a great many ways to the demands of the people. It has passed a great many very important bills on the lines of Democracy; and, so far as we are concerned, we have conformed in the tariff as nearly as we could to our promises and pledges. We passed the seigniorage bill and repealed the Federal election law, and enacted a great many measures of importance to the people of this country; and yet on this money question we have not conformed to our principles or to our pledges. And we, Mr. Chairman, who believe in the principles—the great principles of Democracy—will insist that neither now nor in the future shall there be any compromise on this subject that does not look to the restoration of the money of the Constitution and bringing the Democratic party back on the lines of Democratic principles."

An attempt was made to rush the measure through the House of Representatives; and Jan. 7, 1895, a Democratic caucus was held, at which it was decided by a vote of 81 to 59 to call upon the House Committee on Rules to report a resolution, providing for the consideration of the Springer substitute for the Carlisle bill, in general debate, for one day, then for its discussion under the five-minute rule, and finally for a vote on its passage before the close of the week. On Wednesday, Jan. 9, the following resolution for immediate consideration was reported from the Committee on Rules by Mr. Outhwaite, of Ohio, who called for the previous question on it:

Resolved, That, immediately upon the adoption of this order, the House shall resolve itself into the Committee of the Whole for the further consideration of H. R. 8149; that general debate thereon be then closed. That H. R. No. 8410 (which is substantially the substitute bill submitted by the chairman of the Committee on Banking and Currency on the 21st day of December last) be substituted for said bill, and considered by said Committee of the Whole as an original bill, under the five-minute rule, this and each succeeding day after the morning hour (unless sooner disposed of) until 4.50 p. m. on Friday, the 11th instant, when the same shall be reported to the House, with pending amendments, and the previous question shall then be considered as ordered on said amendments and on the bill to its passage. On Saturday, the 12th instant, immediately after the first morning hour, without intervening motions, the vote shall be taken on said bill and amendments until the same has been fully disposed of.

It was understood that a refusal to sustain the demand for the previous question would kill the measure; and it failed by the following vote:

YEA—Abbott, Alderson, Alexander, Allen, Bankhead, Barnes, Barwig, Beckner, Bell of Texas, Berry, Black of Georgia, Boatner, Bower of North Carolina, Bretz, Brickner, Brookshire, Cabanis, Cadmus, Campbell, Cannon of California, Caruth, Catchings, Causey, Clancy, Clarke of Alabama, Cobb of Alabama, Coombs, Cornish, Covert, Cox, Crawford, Culbertson,

Davey, Denson, Dinwiddie, Dockery, Durbin, English of California, Epes, Erdman, Fielder, Fithian, Geary, Geissenhainer, Goodnight, Grady, Gresham, Griffin of Michigan, Hall of Minnesota, Hall of Missouri, Hammond, Hare, Harrison, Henderson of North Carolina, Henry, Hines, Holman, Hutcheson, Izlar, Kilgore, Kyle, Lapham, Lawson, Lester, Livingston, Lockwood, Lynch, Maddox, Mallory, Martin of Indiana, McCreary of Kentucky, McCulloch, McDearmon, McGann, McKaig, McMillin, Meredith, Meyer, Montgomery, Moses, O'Neil of Massachusetts, Outhwaite, Page, Paschal, Patterson, Pearson, Pendleton of Texas, Pendleton of West Virginia, Pigott, Richards of Ohio, Richardson of Tennessee, Ritchie, Robbins, Rusk, Russell of Georgia, Ryan, Sayers, Sehermerhorn, Sipe, Sperry, Springer, Stallings, Stevens, Stone of Kentucky, Straus, Swanson, Talbot of Maryland, Tate, Taylor of Indiana, Tracey, Tucker, Turner of Georgia, Tyler, Warner, Washington, Weadcock, Wells, Wheeler of Alabama, Williams of Illinois, Williams of Mississippi, Wilson of West Virginia, Wise, Wolverton, Woodard—124.

NAY—Adams of Pennsylvania, Aldrich, Arnold, Avery, Bailey, Baker of Kansas, Baker of New Hampshire, Bartholdt, Bell of Colorado, Beltzhoover, Bland, Boen, Bowers of California, Broderick, Brownell, Brosius, Bryan, Bundy, Cannon of Illinois, Capelhart, Chickering, Clark of Missouri, Cockrell, Coffeen of Wyoming, Coffin of Maryland, Conn, Cooper of Texas, Cooper of Wisconsin, Cousins, Curtis of Kansas, Curtis of New York, Dalzell, Daniels, Davis, De Armond, Dingley, Dolliver, Doolittle, Draper, Edmunds, Ellis of Kentucky, Ellis of Oregon, Gardner, Gillet of New York, Gillett of Massachusetts, Griffin of Wisconsin, Grout, Grow, Hager, Hainer of Nebraska, Haines, Harner, Harris, Hartman, Hatch, Haugen, Henderson of Iowa, Hepburn, Hermann, Hicks, Hitt, Hooker of Mississippi, Hopkins of Illinois, Hopkins of Pennsylvania, Hunter, Ikert, Johnson of North Dakota, Jones, Kem, Kiefer, Lacey, Latimer, Little, Loud, Loudenslager, Magner, Mahon, McCall, McDowell, McEtrick, McLaurin, McRae, Meiklejohn, Money, Moore, Morgan, Morse, Neill, Northway, Ogden, Pence, Perkins, Phillips, Pickler, Powers, Quigg, Randall, Ray, Reed, Reyburn, Richardson of Michigan, Robertson of Louisiana, Robinson of Pennsylvania, Russell of Connecticut, Scranton, Shell, Sibley, Simpson, Smith, Snodgrass, C. W. Stone, W. A. Stone, Storer, Strait, Strong, Talbert of South Carolina, Terry, Thomas, Updegraff, Van Voorhis of New York, Van Voorhis of Ohio, Wadsworth, Walker, Wanger, Waugh, White, Whiting, Wilson of Ohio, Wooster, Wright—180.

NOT VOTING—Adams of Kentucky, Aitken, Apsley, Babcock, Baldwin, Bartlett, Belden, Bingham, Black of Illinois, Blair, Boutelle, Braneli, Breckinridge, Brown, Bunn, Burnes, Burrows, Bynum, Caminetti, Childs, Cobb of Missouri, Cockran, Cogswell, Cooper of Florida, Cooper of Indiana, Crain, De Forest, Donovan, Dunn, Dunphy, English of New Jersey, Enloe, Everett, Fletcher, Forman, Funk, Fyan, Gear, Goldzier, Gorman, Graham, Grosvenor, Harter, Hayes, Heard, Heiner of Pennsylvania, Henderson of Illinois, Hendrix, Hooker of New York, Houk, Hudson, Hull, Johnson of Indiana, Johnson of Ohio, Kribbs, Lane, Layton, Lefever, Linton, Lucas, Maguire, Marsh, Marshall, Marvin of New York, McAleer, McCleary of Minnesota, McDannold, McKeighan, McNagney, Mercer, Milliken, Moon, Murray, Mutchler, Newlands, O'Neill of Missouri, Payne, Price, Rayner, Reilly, Settle, Sherman, Sickles, Somers, Sorg, Stephenson, Stockdale, Sweet, Tarsney, Tawney, Taylor of Tennessee, Turner of Virginia, Turpin, Weaver, Wheeler of Illinois, Wilson of Washington—97.

The Bond Question.—At the beginning of the year there were heavy drafts made on the Treasury for gold; and the gold reserve, which had been advanced to \$108,888,432 by the sale of

the second bond issue of \$50,000,000, Nov. 26, 1894, fell to \$52,463,173 on Jan. 28, 1895. On that day the President sent to the Congress a message, in which he said that a crisis had come demanding other legislation than the currency measure proposed in his annual message of the previous month, and urged the issue of bonds, payable in gold, instead of in coin, to replenish the gold reserve and redeem for cancellation the legal-tender notes of the Government:

To the Senate and House of Representatives:

In my last annual message I recommended to the serious consideration of Congress the condition of our national finances, and in connection with the subject outlined a plan of currency legislation which at that time seemed to furnish protection against impending danger. This plan has not been approved by the Congress. In the meantime the situation has so changed, and the emergency now appears so threatening, that I deem it my duty to ask at the hands of the legislative branch of the Government such prompt and effective action as will restore confidence in our financial soundness and avert business disaster and universal distress among our people.

Whatever may be the merits of the plan outlined in my annual message as a remedy for the then existing, and as a safeguard against the depletion of the gold reserve then in the Treasury, I am now convinced that the reception by the Congress and our present advanced stage of financial perplexity necessitate additional or different legislation.

With natural resources unlimited in variety and productive strength, and with a people whose activity and enterprise seek only a fair opportunity to achieve national success and greatness, our progress should not be checked by a false financial policy and a headlong disregard of sound monetary laws, nor should the timidity and fear which they engender stand in the way of our prosperity.

It is hardly disputed that this predicament confronts us to-day. Therefore, no one in any degree responsible for the making and execution of our laws should fail to see a patriotic duty in honestly and sincerely attempting to relieve the situation. Manifestly this effort will not succeed unless it is made untrammelled by the prejudice of partisanship and with a steadfast determination to resist the temptation to accomplish party advantage. We may well remember that if we are threatened with financial difficulties all our people in every station of life are concerned; and surely those who suffer will not resolve the promotion of party interests as an excuse for permitting our present troubles to advance to a disastrous conclusion. It is also of the utmost importance that we approach the study of the problems presented as free as possible from the tyranny of preconceived opinions, to the end that in a common danger we may be able to seek with unclouded vision a safe and reasonable protection.

The real trouble which confronts us consists in a lack of confidence, widespread and constantly increasing, in the continuing ability or disposition of the Government to pay its obligations in gold. This lack of confidence grows to some extent out of the palpable and apparent embarrassment attending the efforts of the Government under existing laws to procure gold, and to a greater extent out of the impossibility of either keeping it in the Treasury or cancelling obligations by its expenditure after it is obtained.

The only way left open to the Government for procuring gold is by the issue and sale of its bonds. The only bonds that can be so issued were authorized nearly twenty-five years ago, and are not well calculated to meet our present needs. Among other disadvantages, they are made payable in coin, instead of specifically in gold, which, in existing conditions, detracts largely and in an increasing ratio from their desirability as investments. It is by no means certain that bonds of this description can much longer

be disposed of at a price creditable to the financial character of our Government.

The most dangerous and irritating factors of the situation, however, remain to be mentioned. It is found in the means by which the Treasury is depleted of the gold thus obtained without creating a single Government obligation and solely for the benefit of those who find profit in shipping it abroad, or whose fears induce them to hoard it at home. We have outstanding about \$200,000,000 of currency notes of the Government for which gold may be demanded, and, curiously enough, the law requires that when presented and, in fact, redeemed and paid in gold, they shall be released. Thus the same notes may do duty many times in drawing gold from the Treasury; nor can the process be arrested as long as private parties, for profit or otherwise, see an advantage in repeating the operation. More than \$200,000,000 in these notes have already been redeemed in gold, and notwithstanding such redemption they are all still outstanding.

Since the 17th day of January, 1894, our bonded interest-bearing debt has been increased \$100,000,000 for the purpose of obtaining gold to replenish our gold reserve. Two issues were made amounting to \$50,000,000 each—one in January and the other in November. As a result of the first issue there was realized something more than \$50,000,000 in gold. Between that issue and the succeeding one in November, comprising a period of about ten months, nearly \$100,000,000 in gold were drawn from the Treasury. This made the second issue necessary, and upon that more than \$50,000,000 in gold was again realized. Between the date of this second issue and the present time, covering a period of only about two months, more than \$50,000,000 in gold have been drawn from the Treasury. These large sums of gold were expended without any cancellation of Government obligations or in any permanent way benefiting our people or improving our pecuniary situation.

The financial events of the past year suggest facts and conditions which should certainly arrest attention.

More than \$172,000,000 in gold have been drawn out of the Treasury during the year for the purpose of shipment abroad or hoarding at home.

While nearly \$100,000,000 of this amount was drawn out during the first ten months of the year, a sum aggregating more than two thirds of that amount, being about \$65,000,000, was drawn out during the following two months, thus indicating a marked acceleration of the depleting process with the lapse of time.

The obligations upon which this gold has been drawn from the Treasury are still outstanding and are available for use in repeating the exhausting operation with shorter intervals as our perplexities accumulate.

Conditions are certainly supervening tending to make the bonds which may be issued to replenish our gold less useful for that purpose.

An adequate gold reserve is in all circumstances absolutely essential to the upholding of our public credit and to the maintenance of our high national character.

Our gold reserve has again reached such a stage of diminution as to require its speedy re-enforcement.

The aggravations that most likely follow present conditions and methods will certainly lead to misfortune and loss, not only to our national credit and prosperity and to financial enterprises, but to those of our people who seek employment as a means of livelihood, and to those whose only capital is their daily labor.

It will hardly do to say that a simple increase of revenue will ease our troubles. The apprehension now existing and constantly increasing as to our financial ability does not rest upon a calculation of our revenue. The time has passed when the eyes of investors abroad and our people at home were fixed upon the revenues of the Government. Changed

conditions have attracted their attention to the gold of the Government. There need be no fear that we can not pay our current expenses with such money as we have. There is now in the Treasury a comfortable surplus of more than \$63,000,000, but it is not in gold, and therefore does not meet our difficulty.

I can not see that differences of opinion concerning the extent to which silver ought to be coined or used in our currency should interfere with the counsels of those whose duty it is to rectify evils now apparent in our financial situation. They have to consider the question of national credit, and the consequences that will follow from its collapse. Whatever ideas may be insisted upon as to silver or bimetalism, a proper solution of the question now pressing upon us only requires a recognition of gold as well as silver, and a concession of its importance, rightfully or wrongfully acquired, as a basis of national credit, a necessity in the honorable discharge of our obligations payable in gold, and a badge of solvency. I do not understand that the real friends of silver desire a condition that might follow inaction or neglect to appreciate the meaning of the present exigency, if it should result in the entire banishment of gold from our financial and currency arrangements.

Besides the Treasury notes, which certainly should be paid in gold, amounting to nearly \$500,000,000, there will fall due in 1904 \$100,000,000 of bonds issued during the last year, for which we have received gold, and in 1907 nearly 600,000,000 of 4-per-cent. bonds issued in 1877. Shall the payment of these obligations in gold be repudiated? If they are to be paid in such a manner as the preservation of our national honor and national solvency demands, we should not destroy or even imperil our ability to supply ourselves with gold for that purpose.

While I am not unfriendly to silver, and while I desire to see it recognized to such an extent as is consistent with financial safety and the preservation of national honor and credit, I am not willing to see gold entirely banished from our currency and finances. To avert such a consequence I believe thorough and radical remedial legislation should be promptly passed. I therefore beg the Congress to give the subject immediate attention.

In my opinion the Secretary of the Treasury should be authorized to issue bonds of the Government for the purpose of procuring and maintaining a sufficient gold reserve and the redemption and cancellation of the United States legal-tender notes and the Treasury notes issued for the purchase of silver under the law of July 14, 1890. We should be relieved from the humiliating process of issuing bonds to procure gold to be immediately and repeatedly drawn out on these obligations for purposes not related to the benefit of our Government or our people. The principal and interest of these bonds should be payable on their face in gold, because they should be sold only for gold or its representative, and because there would now probably be difficulty in favorably disposing of bonds not containing this stipulation. I suggest that the bonds be issued in denominations of \$20 and \$50 and their multiples and that they bear interest at a rate not exceeding 3 per cent. per annum. I do not see why they should not be payable fifty years from their date. We of the present generation have large amounts to pay if we meet our obligations, and long bonds are most salable. The Secretary of the Treasury might well be permitted, at his discretion, to receive on the sale of bonds the legal-tender and Treasury notes to be retired, and of course when they are thus retired or redeemed in gold they should be canceled.

These bonds under existing laws could be deposited by national banks as security for circulation; and such banks should be allowed to issue circulation up to the face value of these or any other bonds so deposited, except bonds outstanding bearing only 2 per cent. interest, and which sell in the market at less than par. National banks should not be allowed to take out circulating notes of a less denomination than

\$10, and when such as are now outstanding reach the Treasury, except for redemption and retirement, they should be canceled and notes of the denomination of \$10 and upward issued in their stead. Silver certificates of the denomination of \$10 and upward should be replaced by certificates of denominations under \$10.

As a constant means for the maintenance of a reasonable supply of gold in the Treasury, our duties on imports should be paid in gold, allowing all other dues to the Government to be paid in any other form of money.

I believe all the provisions I have suggested should be embodied in our laws if we are to enjoy a complete reinstatement of a sound financial condition. They need not interfere with any currency scheme providing for the increase of the circulating medium through the agency of national or State banks that may commend itself to the Congress, since they can easily be adjusted to such a scheme. Objection has been made to the issuance of interest-bearing obligations for the purpose of retiring the noninterest-bearing legal-tender notes. In point of fact, however, these notes have burdened us with a large load of interest, and it is still accumulating. The aggregate interest on the original issue of bonds, the proceeds of which in gold constituted the reserve for the payment of these notes, amounted to \$70,326,250 on Jan. 1, 1895, and the annual charge for interest on these bonds and those issued for the same purpose during the last year will be \$9,145,000, dating from Jan. 1, 1895.

While the cancellation of these notes would not relieve us from the obligations already incurred on their account, these figures are given by way of suggesting that their existence has not been free from interest charges and that the longer they are outstanding, judging from the experience of the last year, the more expensive they will become.

In conclusion, I desire to frankly confess my reluctance to issuing more bonds in present circumstances and with no better results than have lately followed that course. I can not, however, refrain from adding to an assurance of my anxiety to co-operate with the present Congress in any reasonable measure of relief, an expression of my determination to leave nothing undone which furnishes a hope for improving the situation or checking a suspicion of our disinclination or disability to meet with the strictest honor every national obligation.

GROVER CLEVELAND.

EXECUTIVE MANSION, Jan. 23, 1895.

On the same day Mr. Springer, of Illinois, introduced the following bill designed to carry out the President's recommendations.

A bill to authorize the Secretary of the Treasury to issue bonds to maintain a sufficient gold reserve and to redeem and retire United States notes, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That in order to enable the Secretary of the Treasury to procure and maintain a sufficient gold reserve and to redeem and retire United States legal-tender notes and Treasury notes issued under the act of July 14, 1890, entitled "An Act directing the purchase of silver bullion and the issue of Treasury notes thereon, and for other purposes," he is hereby authorized to issue and sell, at not less than par, in gold, except as provided in section 2 of this act, United States registered or coupon bonds, in denominations of \$20 and \$50, and multiples of said sums, respectively, payable fifty years after date in gold coin of the United States of the present weight and fineness, and bearing interest at a rate not exceeding 3 per cent. per annum, payable quarterly in like coin; and such bonds and the interest thereon shall have like qualities, privileges, and exemptions as the bonds issued under the act approved July 14, 1870, entitled "An Act to authorize the refunding of the national debt." Such bonds may be sold and delivered in the United States, or elsewhere, as may be

issued most advantageous to the interests of the Government.

Sec. 2. That whenever any United States legal-tender notes or Treasury notes shall be redeemed in gold, they shall be cancelled and not reissued; and the Secretary of the Treasury is hereby authorized, in his discretion, to receive United States legal-tender notes and Treasury notes issued under the aforesaid act of July 14, 1860, in payment for any of the bonds issued under the preceding section of this act, and the notes so received shall be cancelled and not reissued.

Sec. 3. That hereafter national banking associations may take out circulating notes in the amount now provided by law to an amount equal to the par value of the bonds deposited to secure the same; but this provision shall not apply to any bonds now outstanding bearing interest at the rate of 2 per cent. only.

Sec. 4. That hereafter no national bank notes of a less denomination than \$10 shall be issued, and as rapidly as such notes of denominations less than \$10 shall be received into the Treasury, otherwise than for redemption and retirement, they shall be cancelled, and an equal amount of notes of like character, but in denominations of \$10 and multiples thereof, shall be issued in their places. All silver certificates now outstanding, in denominations larger than \$10, shall, when received into the Treasury of the United States, be retired and cancelled, and silver certificates in denominations less than \$10 shall be issued in their stead.

Sec. 5. That from and after the 1st day of July, 1860, all duties on imports shall be paid in gold coin only, and all taxes, debts, and demands, other than duties on imports, accruing or becoming due to the United States shall be paid in gold and silver coin, Treasury notes, United States notes, silver certificates, or notes of national banks.

Sec. 6. That all laws and parts of laws inconsistent with the provisions of the preceding sections be, and they are hereby, repealed; and a sum sufficient to carry the provisions of this act into effect be, and the same is hereby, appropriated out of any money in the Treasury not otherwise appropriated.

Feb. 1, this measure, which had been referred to the Committee on Banking and Currency, was reported back with this proviso covering a difference of opinion in the committee: "The extraordinary condition to which the President has referred in his message, and the necessity for immediate action in view of the early adjournment of this Congress, have constrained your committee to concur in rejoining the bill with the proposed amendments to the House for its consideration, each member reserving to himself the right to file his separate views thereon and have them printed with the report of the committee, and vote on the proposed amendments and other amendments which may be offered in the House and on the final passage of the bill as he may determine."

On Monday, Feb. 4, the following rule, making the measure a special order, was reported from the Committee on Rules and adopted:

Resolved, That on Tuesday, the 5th instant, immediately after the call of committees for reports, the House shall resolve itself into Committee of the Whole for the consideration of H. R. 3709; that general debate shall be allowed during that day; that on Wednesday, the 6th, after the call of committees for reports, the House shall again resolve itself into Committee of the Whole for the consideration of said bill, and at the hour of 2 o'clock p. m., unless sooner terminated, general debate shall be closed, and the consideration of said bill shall continue under the five-minute rule, with this modification: It shall be in order, immediately after general debate is closed, to offer an

amendment to any section of the bill, and two substitutes for the whole bill (provided that no more amendments shall be pending at any time than are permitted by the rules of the House), and no more than thirty minutes' debate (fifteen minutes on a side) shall be permitted on any amendment before the vote shall be taken thereon; that on Thursday, the 7th instant, after the call of committees for reports, the House shall again go into Committee of the Whole for the consideration of said bill under the five-minute rule, with the modification mentioned herein, and consideration thereof shall continue until 1.30 p. m. of said day, when the committee shall rise and report said bill to the House, together with any amendments that may have been agreed to, or may be pending, in the committee, when the previous question shall be considered as ordered on said amendments and on the bill to its passage, whereupon, without intervening action, votes shall be taken on said bill until the same shall have been fully disposed of.

The debate on the subject went over ground frequently traversed, and there were few questions of interest or ability. Mr. Brookes, of Pennsylvania, put the plea for urgency as follows:

"Mr. Chairman, the mischief works while we wait; the difficulties deepen while we dally with our duty; promptitude is of the essence of our obligation to act, and therefore I believe that any union of minds and voices in this chamber that will bring succor to the country and spare us national disgrace will be an honorable and patriotic alliance.

"That action might be impeded by the delays of controversy and the peril of final disagreement, I have sought in my humble way to have the bill as free as possible from causes of division among us, for I have believed it would promote the passage of a measure to limit its scope to the very mischief to be remedied. A bill, short, sharp, and decisive, that goes directly to the purpose in view, without circumlocution, without the baggage of incidental and unnecessary meddling with other and different matters of legislation, will be much more likely to pass this House than one containing a variety of unrelated provisions which multiply the points of controversy and invite contention and disagreement over matters in which one and another sees a service to some special interest.

"There is hope of agreement only in minimizing the grounds of controversy, and hence I have tried to keep out of the bill provisions looking to the reorganization of our financial system, which undertaking is not, in my judgment, suitable to the circumstances of our situation, and can be wisely deferred to a more appropriate season instead of engaging our minds when they are already taxed to the limit of their capacity in finding a way to strengthen the Treasury and insure the solvency of the Government.

"What, then, Mr. Chairman, stands in the way? Are we kept from agreement by an unworthy pride that is ashamed to yield or an equally censurable obstinacy that delights to contend?

"It is not patriotic nor wise to waste time and further embarrass the situation by hypercriticism and capious and carping complaints of the details of the proposed measure as long as it is in substance calculated to answer the end proposed. If it bridges the chasm it ought to pass in one form or another.

"In one of the trying hours of Mr. Lincoln's

experience during the war, when he keenly felt the unkindness of those who carped and caviled at his conduct, when he bent and swayed under the mighty responsibilities of the war, he illustrated the situation in this striking manner. He said: 'If all your property was in gold, and you had put it in the hands of Blondin to carry across Niagara on a rope, would you shake the cable or keep shouting at him, "Stand straighter! Walk faster! Walk slower! Lean north or south!"? No; you would hold your breath and your tongue as well.'

"The administration is trying to keep the gold in the Treasury to save the honor of the United States, and it is unpatriotic to catch at unconsidered trifles to impede the consummation of the undertaking. Or is it mere partisan politics that hinders us? Perish the thought! The representatives of the people must be patriots before they are partisans. Will any member dispute the proposition that in the situation which invites our consideration, with a crisis looming, huge and hideous, in the twilight future, we ought to see nothing but the best interests of the country?

"The member of this House who in the supreme exigency suffers his vision to be obscured, his judgment to be warped, and his conclusions to be vitiated by prejudice, passion, or partisanship discredits himself in the eyes of his country and will be held to strict accountability by his constituents. There is but one word that can express the inspiring and controlling influence of this hour, and that word is "patriotism." There is but one word that can denote the action which that overruling inspiration commands, and that word is "duty." He who is insensible to the one or disobedient to the other is not a safe custodian of his country's interests, and was misdirected when he was sent to this body.

"I indulge the hope that no member of this House entertains views of public duty which constrain him in determining his action upon this measure to ask who initiated it, but only is it wise legislation? not which side of this Chamber is advocating or opposing it, but only is it calculated to meet the need of the hour and mitigate the afflictions we are suffering by restoring the confidence of our people in the money of the country?

"I am profoundly moved by the conviction that this is the time and this the occasion (if I may be pardoned for using an illustration a second time in this presence) for us to emulate the generous sentiment expressed by Philip of France in the Crusades, when he said to Richard of England: 'Let the only strife between the lions of England and the lilies of France be which shall carry them farthest into the ranks of the infidels.' So I pray you, let the only strife between the parties represented in this Chamber to day, in the presence of this impending crisis, be which shall carry the banner of honorable, patriotic, and effective relief farthest into the ranks of the opposition."

Mr. Reed, of Maine, made this argument in introducing a substitute for the Springer bill:

"In order to ascertain what remedy we ought to apply to the present condition of things our first duty is to ascertain what is the condition of

things. The United States Government has issued at different times \$346,000,000 of what are known as legal-tender notes, and \$150,000,000 more which are known as Treasury notes of 1890, making in all \$496,000,000 of paper obligations of the Government which the Government may be called upon to pay under our present system of finance.

"For a country like the United States this is a sum not worth talking about from any point of view of the ability of the Government to pay and to pay promptly. Therefore there must have been something done which created any distrust that now exists.

"What was done? The first thing that was done—the main thing that was done—which caused the present condition of affairs, was the passage of financial measures which have resulted in a deficit of \$107,000,000 up to the present date, and which seem to indicate in their operation a further deficiency, whether permanent or temporary. This caused a peculiar condition of things in the United States Treasury. The United States Treasury keeps practically two accounts: First, the account of the United States as a banker, which has issued its notes and announced its readiness to redeem those notes whenever the holders or possessors may demand the same. For a period of sixteen years the United States has been a banker, without question as to its ability to pay. Within the last year doubts have been thrown about that ability. But there is another department of the United States Treasury, which is the department of the United States as a business establishment. That business establishment has been running astern \$107,000,000 up to this time, with more deficits in prospect.

"Unfortunately for the Government those two operations, those two departments of the Government have been mingled together in such fashion that the misfortunes of the business department have been devolved in the popular mind on the banking department. The United States has redeemed, as it has agreed to redeem, thus far every note which has been presented. But unfortunately the exigencies of its business department have compelled it to put out \$107,000,000, more or less, in order to meet the necessities of that business department.

"Now, the business department, instead of borrowing money on its own hook, has taken the money of the banking department and reissued it; and the result is what is known in popular phrase as the "endless chain," whereby the United States has been made the furnisher of gold to the rest of the world, a condition of things never contemplated by our system of finance, a condition of things which never need to have occurred; but it has occurred, and the President of the United States has appealed not merely to his own party associates, who are in a great majority in this House, but to the gentlemen upon the other side for assistance.

"I could have wished that there had been some consideration for the views of gentlemen on the other side, and that we had not been appealed to to forget the tyranny of preconceived opinions when those preconceived opinions were supposed to be our own merely and not the preconceived opinions of others. However, we are

face to face with the situation, and while as a party man I may not be melancholy about the condition of the Democratic party, as a citizen of the United States I am ready at all times to assist the country in which I live. But it must be done according to my opinions and those who think with me—according to our opinions of what is just and right, having reference to its practicability and reasonableness, without bigotry, in good faith and honesty.

"In order, in my judgment, to reach the present crisis, it is not necessary to go into general financial and currency legislation. General financial and currency legislation can not be had in this country at the dictation of any one man. I do not now refer to the Executive in any way whatever when I make that assertion. I am only laying down a general proposition when I say it can not be done at the dictation of any one man. It has got to be done by the consensus of the people of the United States after a full and fair discussion.

"Such a discussion is not liable to be had or even possible on the eve of a session. But perhaps I may be able to dispose of the whole matter by appealing to every man of this audience as to the truth of my statement that, whatever bill passes this House there is no possibility of its going further, and therefore it ceases to be a practical measure. It does seem to me a practical measure could be presented, however, to Congress, one we could be able to vote for without adding to the one question others upon which other gentlemen have difficulties which are not so easy to get over.

"Our situation is this: We were redeeming greenbacks when they were presented. If the revenue was equal to the expenditures whenever a greenback was redeemed it would stay in the Treasury, and this notwithstanding the fact the Secretary is authorized to reissue; for it is not either the authorization nor even the demand of the law that they shall be reissued that causes the trouble. It is the fact that they are reissued. It is the fact that their reissuance causes this continual depletion of the Treasury. Now, I will fortify my own statement by a recurrence to the Treasury figures themselves.

"In March, 1893, the demand notes of the Government which were in the Treasury were \$30,000,000 in amount. To-day the amount is \$134,000,000, nearly \$135,000,000. In other words, we have redeemed \$88,000,000 of the United States demand notes which up to date stay redeemed. We had in gold when this Administration entered into power \$107,000,000. We have borrowed \$117,000,000, which makes \$224,000,000. We have on hand \$42,000,000; showing that we have paid out \$182,000,000. Of this \$105,000,000 has indirectly gone to pay for the deficiency in the revenue, and that leaves \$77,000,000 which ought to have been the amount of our redemption of the greenbacks; but in reality we have redeemed \$88,000,000, and added \$11,000,000 more out of other funds than this greenback redemption fund called upon us to redeem. I say that is not a bad showing in the present unfortunate condition of affairs. It is not a bad showing for the working of the system under this tremendous disadvantage. Now, let us see what is our situation and our future liabilities.

"As I have already stated, we had originally \$496,000,000 of demand notes. We have \$134,000,000 of these notes in the Treasury of the United States. That leaves us as demandable \$372,000,000. We have \$42,000,000 in gold, which leaves the demand for which there is no gold in the Treasury to meet \$332,000,000. In other words, the United States stands face to face with an emergency of \$332,000,000. That is not vast when you think what we have met and conquered in the way of finance. It seems strange that \$332,000,000 should stagger us; and the only reason why it does stagger us is because in the popular mind this drain of \$107,000,000, which was for the United States deficiency, is attributed to an eager rush by the people to have the greenbacks redeemed.

"Now, what is the remedy? Why, the remedy is plainly to separate these two transactions; to let the people of the United States see precisely what is going on and the people of the world see what is going on. When the Government negotiates the next \$100,000,000, which, if rumor be correct, is already negotiated, we shall then only have \$232,000,000 outstanding, with ample authority on the part of the Government to raise every dollar of that. Now, what is the condition in which a favorable state of affairs will exist? It is that condition which we shall have when we keep separate from our banking department our business department. How shall we meet the business in our business department?—because that is partially involved in the problem. We would meet it on our side, perhaps, by proposing to make the revenue equal to the expenditures; but there are difficulties in the way of that just as there are difficulties in the way of this original bill.

"These difficulties in the way of raising revenue arise from a pride, if I can call it pride, in the present advantageous tariff bill. A proposition to raise revenue would be, in a certain sense, a confession, and confession would perhaps be suicide. Then again we are bound in our transactions here to pay some attention to the constituted authorities, and the constituted authorities for the next two years, for this purpose, are the present Secretary of the Treasury and the President of the United States. Now, the Secretary of the Treasury, with a precision whose accuracy I wish for the sake of a simple world had not been so complete—the present Secretary says that at the end of this year there will be a surplus of \$22,563,023.

"I do not desire in any way to throw doubt upon this calculation. I hope it is correct. At any rate, we are bound to treat it as being so. But the present condition undoubtedly is temporarily—even if the Secretary be right—that of a monthly deficiency.

"Now, that deficiency might not be run into our gold account. It ought to be separate. It ought to be kept by itself. How will you do that? The remedy is perfectly simple. If the Secretary will not have revenue, and declares that he is face to face with a surplus, we must treat the case upon that basis. Otherwise we arouse party feeling and come to no arrangement on the subject. How shall we do that? It seems to me that we should require the Secretary of the Treasury, as long as this deficiency

continues to exist, even though it exists only temporarily, to issue certificates of indebtedness bearing such rates of interest, not exceeding 3 per cent., as he deems suitable and proper, so as to pay off this deficiency just as fast as it accrues, and leave untouched the greenback redeeming resources of the country.

"Let the people of the United States then see whether those who have greenbacks do not want them, and if they are all returned it may be a guide to the people to know what to do with those greenbacks. If they do not choose at some future time to destroy them; if, when the times become as they have been during the past sixteen years, the people prefer to use them, we owe debts enough to employ them, and perhaps they may be used to redeem these very bonds which produce the gold.

"So, also, when we come to the surplus which Mr. Carlisle thinks is in sight. When we come to that, if we issue certificates of indebtedness for the deficit, certificates running two years—I would not care if the time was even shorter, but say two years—redeemable at the pleasure of the Government, then the surplus can be used to wipe out that deficit, and we shall stand free from that part of our debt.

"In addition to that, these certificates offer an advantage to the country over the present system. Under the present system the deficiency must be met by a long-time gold bond, and when we get ready to purchase those bonds, that is just the time that they will get ready to go up, and we shall pay a pretty penny before we get them back; but if we issue short-time certificates of indebtedness, temporary on their face, we supply the place of these long gold bonds, which will otherwise have to be paid.

"Now, why is not that the solution of our problem without raising vexed questions which we know can not be solved? Why is it not a practical solution of our trouble? Why is it not suitable in every way?"

The substitute proposed by Reed was as follows:

A bill to provide for a temporary deficiency of revenue.

Be it enacted, etc., That to enable the Secretary of the Treasury to provide for and maintain the redemption of United States notes according to the provisions of the act approved Jan. 14, 1875, entitled "An Act to provide for the resumption of specie payments," he is authorized, in addition to the power he now has under said act, from time to time, at his discretion, to issue, sell, and dispose of, at not less than par in coin, either of the description of bonds authorized in said act, or coupon or registered bonds of the United States, to an amount sufficient for the objects herein stated, bearing not to exceed 3 per cent. interest per annum, payable semiannually, and redeemable, at the pleasure of the United States, in coin, after five years from their date, with like qualities, privileges, and exemptions provided in said act for the bonds therein authorized. And the Secretary of the Treasury shall use the proceeds thereof for the purposes herein provided for, and none other.

SEC. 2. That to enable the Secretary to pay the current expenses of the Government so long as the current revenues shall be deficient he is authorized and required from time to time, in his discretion, to issue, sell, and dispose of, at not less than par, such an amount of certificates of indebtedness of the denomination of \$25, \$50, and \$100, or any multiple thereof, as may be needed for that purpose, bearing not to ex-

ceed 3 per cent. interest per annum, payable semiannually, and redeemable at the pleasure of the Government, in coin, after two years from their date, with like qualities, privileges, and exemptions provided in the act approved Jan. 14, 1875. The Secretary may at his discretion sell and dispose of the same for not less than an equal amount of lawful money of the United States, at designated depositories of the United States, and at such post offices as he may select, and the Secretary shall use the proceeds thereof for the purpose provided for in this section, and for none other.

Mr. Swanson, of Virginia, urged the arguments of the Democratic opponents of the measure:

"Let us examine the propositions of the pending bill. Let us divest them of all the misconceptions with which gentlemen who advocate them have sought to envelop them, so that the country may see them in their nakedness. Let the farming, producing, mercantile classes clearly understand what is here proposed and its effects. The first section of the bill provides for the sale of \$500,000,000, of 3-per-cent. bonds payable in gold alone. These bonds are to run for fifty years. They are nontaxable. It means an opportunity for that amount of wealth, possessed by the rich, to escape all city, county, State, and Federal taxation by being invested in these bonds. It means an annual interest charge upon the Treasury of \$15,000,000 in gold. It means a payment of \$750,000,000 in gold as interest on these bonds by the people before they become due. It means, before the bonds are retired, a payment to the holders of \$1,250,000,000 in gold.

"With the present deficiency in the Treasury this additional charge of \$15,000,000 in annual interest would necessitate increased tariff taxes. So it means higher food, clothing, and necessities of life to the people. It means a perpetuation of the national-bank system and no return to State banks for years. It means the complete establishment of the gold basis in this country. It sanctions, for the first time with governmental approval, the making of gold contracts. It will be followed by all the contracts and obligations of the people being made payable in gold. It is useless for you gentlemen who advocate this bill to deny that you intend to make all private obligations ultimately payable in gold. All your arguments tend to that. The Government has power now to sell bonds payable in coin, which means either gold or silver. You say that European capital will have confidence restored in us if we sell bonds payable in gold alone. It will, you say, be proof to them that all money invested in the United States will be payable in gold. This means, if it means anything, the payment of all private obligations ultimately in gold. With about \$16,000,000,000 of private indebtedness and only about \$500,000,000 of gold with which to pay it, it means to the people bankruptcy and a frightful fall in the price of labor, land, and produce with which to acquire the gold. Convinced of this, I can not vote for a gold bond.

"To what purposes is the money derived by the sale of these bonds to be devoted? You would imagine that money obtained by such extraordinary methods and marking so great and far-reaching a departure would be needed for the purposes of national defense or to avert some frightful disaster.

"The second section of this bill provides that the money thus obtained shall be used to redeem the \$500,000,000 of greenbacks and Sherman Treasury notes, which, when redeemed, shall be canceled and destroyed. The money thus obtained shall be used for the purposes of contraction. It shall be used for the purposes of making money scarcer to the people. When the Republican party had passed legislation providing for the retirement of the greenbacks, it was the Democratic party which passed the present statute which prohibits their cancellation and destruction.

"It was the Democratic party which saved this vast amount of currency to the people. I am unwilling at this time to reverse this policy, unite with the Republican party, and destroy by one act one third of the legal-tender money of this country. I am one of those who believe that, with our increasing population, wealth, business, and commerce, we need an increase and not a contraction of the currency. But the gentlemen who preceded me in advocacy of this bill pretend it will not result in a contraction of the currency, as there is a proviso that these greenbacks and Treasury notes shall only be canceled to the amount of the aggregate of additional national bank notes taken out after the passage of this bill. But this declaration is not true. That provision is simply inserted to deceive this House and the country, and to justify the pretended claim, frequently heard, that this bill does not mean contraction. But I shall expose the falsity of this claim and prove that this bill is actually devised not only to destroy the greenbacks and Treasury notes, but also to enable the national banks, when they desire, to suddenly and absolutely retire the currency they now have out.

"Under this bill the national banks can purchase these bonds, issue \$500,000,000 of national bank notes in February, have the Treasury notes and greenbacks canceled and destroyed by this bill, then in March retire the national bank currency issued, and leave the country absolutely divested of greenbacks, Treasury notes, and national bank notes. To do this existing law must be changed. By present statute all the national banks can not retire currency in excess of \$1,000,000 a month. This law was passed to prevent sudden contractions of the currency by national banks.

"The banks had used their power of contraction fearfully and disastrously. This law prevented it. The fifth section of this bill provides for the repeal of this limitation upon national banks in withdrawing currency, and permits them to withdraw their currency without limit. If this bill should become law the national banks would have the power in one day of retiring their entire notes and produce a frightful contraction of the currency. If these banks do not contemplate in the near future retiring and contracting their currency, why do their friends insert in this bill the repeal of the only restriction against their power of retirement and contraction? The safeguard inserted in the second section is absolutely destroyed by the provisions of the fifth section. I see before me and listening to me prominent gentlemen who advocate this bill, and I call upon

you now to deny if these statements and facts are not true, and if this bill does not permit what I have described. It can not be denied. So the intention of the bill is not only to destroy the greenbacks and Treasury notes, but also to make the way easy to retire the national bank notes.

"But the ultimate and covert aims of this bill do not stop here. It is the commencement of the effort to retire and destroy about \$400,000,000 of silver we have in our currency. If this bill passes you will witness a further depreciation in the value of silver. It sanctions gold contracts by the Government. It repudiates our silver dollars in the payment of our obligations. It stamps with disfavor silver dollars as money. If they can not be used by the Government in its payments to the bondholders, it will be said, why should they be used in payments to others, and by others? If this bill should pass and times get worse and harder, as they surely would, the same parties and the same influences which to-day are behind this bill would come and say that 'the trouble was caused by a lack of confidence in our currency, produced by the infusion of \$400,000,000 of silver therein,' and clamor for the retirement and destruction of that. That design can be seen in section 4 of the bill.

"That section provides that the lawful reserves required of national banks on account of their deposits shall be kept in coin, one half of which at least shall be gold. Now, this section, like the entire bill, conceals its ultimate design. To a thoughtless person this section would appear all right, as requiring one half of the reserve to be in gold and one half in silver, thus maintaining the parity of the two. It was intended to leave the House and country under that impression. But it is the very reverse, and will have the contrary effect. It makes it imperative upon the banks to keep their reserve in coin. With the present deposits of the banks it would require the banks to have \$417,000,000 of coin for a lawful reserve. It requires half of this at least should be in gold. It makes no requirement as to silver. The section actually leaves it optional with the banks to have any silver, but makes it compulsory that it should be kept in coin. Who can doubt that the banks will keep the reserve in gold?

"The Government having discarded silver and sanctioned gold contracts, the banks will not take it up. So the banks will obtain \$417,000,000 of gold for their reserve. If you gentlemen honestly intend to keep up the parity of gold and silver, why not insert in this bill a clear, honest provision, requiring half of the reserve of banks to be kept in silver. This would give us for \$208,000,000 of silver. It would make it to the interest of the entire banking power to keep this silver at parity with gold. It would be a guarantee that there will be no war on this silver in the future. But this provision will result in accumulating all the gold in this country in the hands of the banks and a few bondholders, and thus unite the moneyed power of this country in its efforts to retire the present silver dollars. The passage of this bill would mean the destruction of both greenbacks, Treasury notes, and silver. It would leave us ultimately nothing as

currency except gold and such money as the national banks saw proper to furnish.

"The national bank notes would be redeemable in gold. Thus we would be absolutely upon a gold basis. Our currency would then be in the perfect condition desired by the influences behind this bill. This bill is a decisive step, taken for the complete establishment of the gold basis. Its result will be to put the entire currency and business and property of this country at the mercy of the bondholder. We will have a public debt of \$1,200,000,000, payable in gold. We have only about \$500,000,000 of gold with which to make payments. Thus the bondholders will be the absolute owners of this gold. For the taxing power of the Government, overriding everything else, must sacrifice the property of the citizens at any price to gather in this gold for the bondholders. National bank notes, also, being based on bonds, our money, our currency, our property, will be absolutely at the dictation of the bondholder.

"Money with us will be cheap or dear, scarce or plentiful, as the interest of the bondholder may dictate. I can and will never consent to the creation of such a condition of affairs. It will result only in further poverty, further distress, among the great toiling and producing masses of our citizens. This bill gives contraction, while the increasing population, business, and commerce of the country demand expansion. This bill creates absolutely a single gold standard, while the country to-day is suffering from a lack of bimetalism. To my mind it can only bring to the country less money, lower prices, greater wretchedness, and poverty. I am delighted to see that over three fourths of the Democrats in this House are opposed to its passage.

"The claim that such a bill as this is needed to protect the gold reserve is all pretense and nonsense. The President has ample authority under existing law to sell bonds to replenish the gold reserve. Under present law he can sell bonds and get gold until he has redeemed the last Treasury note. When once redeemed they will not be reissued, unless to meet current expenses of the Government. The President has ample authority to protect and redeem the greenbacks and Treasury notes, and hence the present distress and depression do not come from any lack of confidence in them or the ability of this Government to meet its obligations. The causes lie much deeper. This bill would be but an increase, an aggravation of existing evils. It would be another step into darkness, which we would have to retrace to reach light. Present low prices for produce and labor, present depression and stagnation in business and enterprise, result from the demonetization of silver and the destroying of half the money of ultimate redemption of the world.

"Since that time each year the world over we have witnessed lower wages, lower prices for produce, land, and property. The problem of existence each year becomes harder and harder to the mass of the people. No one can tell that we have yet reached the bottom of the abyss into which we were plunged. No one can tell that prices have yet reached their bottom, so that society can readily adjust itself and credit and confidence in the solvency and abil-

ity of the producing classes be restored. Two years ago I was in Texas and cotton was selling at 7 cents a pound and everybody thought it had reached its bottom, being lower than ever before. Now it has fallen to 5 cents a pound. No one can say but that it will yet go lower. Land with increasing demand and no increase in supply presents the same spectacle of continual fall in prices. No one can say where falling prices will cease. We have no experience in the past history of mankind like the present to furnish us material upon which to reach a conclusion. Never before in the history of the world has it endeavored to do its business with gold alone. Prior to 1873, since the earliest dawn of civilization both gold and silver were used as money.

"Since 1873 gold alone has been the money of the world. Since that time we have been blindly staggering in the dark, not knowing where this great change would lead us. It is a new experiment in the history of the world, and no one can know how much lower it will reduce wages and prices. We only know that it permits debt to remain the same, while each year lowering labor, produce, and property, with which debt is paid. It seems to me, we have gone far enough in this night of darkness, wretchedness, and distress. We should reverse our steps and not go further, as this bill provides. If we can not safely make the entire return in one day, let us at least turn our faces toward the brightness we left and journey back to it as fast as safety and our circumstances will permit. I, for one, will not be allured by promises nor driven by fears further into this unknown and untried darkness.

"Mr. Chairman, what we need more than all else in our currency is money of ultimate redemption. What we need in our currency is not to make the silver dollar redeemable in gold, but to make silver money of ultimate redemption. We should broaden the foundations upon which we rear the superstructure of our currency. Gold is too narrow a basis upon which to build. The whole theory of this bill is to curtail and contract our currency until it is suited to rest upon a narrow gold basis. My belief is that we should broaden the basis of our currency by making silver money of ultimate redemption, and thus enable us to make larger and more perfect the superstructure we should rear.

"Mr. Chairman, my limited time will not permit me to enter into a discussion of the reforms I think needed in our financial system. As I have previously said, the Carlisle bill was a great and beneficial reform which recommended itself to me strongly. I never entertained much hopes of its passage. It brought too many benefits to the people and carried relief and hope too far to suit some. It was indirectly antagonized by those in this House who now seek the passage of this bill. It gave no aid to those who sought the establishment of the gold basis. They always wanted a measure like the pending bill. Whenever you find all the members of a certain section standing by a bill, regardless of party lines, you may be sure that the bill is a step in the direction of a gold basis.

"Why, these people remind me very much of a Southerner who was once in Central Park,

New York, when he heard the band play. When there was a pause he called out for "Dixie," "Dixie" was promptly played for him. When it was concluded he enthusiastically shouted, "Give me "Dixie" again!" It was played for him once more. When the band stopped, more enthusiastically than ever, he shouted, "Give me "Dixie" again!" The leader of the band turned to him and said, "Old man, I reckon when Gabriel blows his trumpet you will call for "Dixie." "Yes," replied the old man, "and if he don't play "Dixie" I won't rise either." So it is with certain gentlemen here. I never see them rise to speak or vote unless in aid of the gold standard. Why, sir, I believe that my friend from New York in front of me, if the angel Gabriel on the day of judgment does not blow with a golden trumpet, will refuse to rise on account of "a want of confidence in the call and trumpet."

The vote deciding the fate of the measure was taken Feb. 7, after the Road substitute had been rejected by a vote of 107 yeas to 189 nays and the elaborate substitute of Mr. Cox, of Tennessee, had been rejected by a vote of 55 yeas to 184 nays. The question was on the engrossment and third reading of the bill; which was defeated by the following vote:

YEAS—Adams of Pennsylvania, Aldrich, Babcock, Baldwin, Barnes, Bartlett, Barwick, Beckner, Bettendorfer, Berry, Dingham, Bonstelle, Brickner, Brosius, Brynes, Cadmus, Canisetti, Campbell, Caruth, Casey, Chickering, Clancy, Clarke of Alabama, Cobb of Missouri, Coffin of Maryland, Cowan, Cooper of Florida, Cooper of Indiana, Cornish, Covert, Crain, Daboll, Daniels, Darrow, De Forest, Dingley, Draper, Duffmy, Durbin, English of California, Erlman, Everett, Fiddler, Fletcher, Foran, Gardner, Geary, Gelschaltner, Gillies of Massachusetts, Goldfarb, Gorman, Groschans, Griffin of Michigan, Griffin of Wisconsin, Groat, Haines, Hall of Minnesota, Hammond, Harner, Harrison, Haugen, Hayes, Hendrix, Henry, Hicks, Hines, Hooker of New York, Klefer, Krishko, Lapham, Lefever, Lockwood, Lynch, Mahon, Marvin of New York, McAlier, McDannold, McGann, McKaig, Meyer, Montgomery, Mutchler, O'Neill of Massachusetts, O'Neill of Missouri, Outhwaite, Page, Paschal, Patterson, Payne, Pearson, Penhallow of West Virginia, Pigott, Powers, Quigg, Randall, Ray, Reed, Reilly, Reynolds, Richards, Ritchie, Russell of Connecticut, Ryan, Schermerhorn, Scranton, Sickles, Sipe, Smith, Somers, Sperry, Stevens, C. W. Stone, W. A. Stone, Stone of Kentucky, Storey, Strawn, Talbot of Maryland, Tansley, Tracy, Turner of Georgia, Turner of Virginia, Turpin, Updegraff, Van Voorhis of New York, Wadsworth, Wangler, Warner, Washington, Wells, Wilson of West Virginia, Wis. Wolverton, Woomer, Wright—155.

NAYS—Adams of Kentucky, Albion, Alderson, Alexander, Arnold, Avery, Baker of Kansas, Baker of New Hampshire, Bankhead, Bell of Colorado, Black of Georgia, Blair, Bland, Bantner, Bonn, Brewer of North Carolina, Bowers of California, Branch, Brookbridge, Brutz, Brudersick, Brownwell, Brookshire, Brown, Bryan, Bundy, Calcutta, Cannon of California, Cannon of Illinois, Childs, Clark of Missouri, Childs of Alabama, Cockrell, Coffin of Wyoming, Cotto, Cooper of Wisconsin, Cousins, Cox, Crawford, Curtis of Kansas, Davis, De Armond, Denison, Dinkerson, Donkery, Dilliver, Dinwiddie, Doolittle, Ellis of Kentucky, Ellis of Oregon, Eskin, Epps, Fithian, Fyan, Goodnight, Grady, Grossinger, Grew, Hager, Halder of Nebraska, Hall of Missouri, Harris, Hartman, Hatch, Heapl, Henderson of Illinois, Henderson of Iowa, Henderson of North Carolina, Hopburn, Hermann, Hitt, Holman, Hooker of Mississippi, Hopkins of Illinois, Hopkins of Pennsylvania, Hudson,

Hallek, Hall, Hamner, Hatchman, Hirt, Isler, Johnson of North Dakota, Kent, Kyle, Lacey, Latta, Latimer, Lawson, Layton, Lester, Little, Livingston, Lord, Lonsdale, Lucas, Macken, Maguire, Mallory, Marsh, Marshall, McClary of Missouri, McClary of Kentucky, McCallach, McDowell, McKelham, McLaurie, McMillin, McNagry, Mellie, Melchior, Mermer, Meredith, Mowry, Moss, Moore, Morgan, Morse, Noll, Newlands, Northway, Ogden, Penhallow of Texas, Perkins, Pickler, Richardson of Michigan, Richardson of Tennessee, Reelina, Robertson of Louisiana, Russell of Georgia, Sayre, Seale, Shull, Shibley, Simpson, Smolensky, Springer, Stallings, Stephenson, Stockdale, Street, Strong, Swanson, Tallant of North Carolina, Tate, Tawney, Taylor of Indiana, Taylor of Tennessee, Terry, Thomas, Tyler, Van Voorhis of Ohio, Walker, Waugh, Wheeler of Alabama, Wheeler of Illinois, White, Whiting, Williams of Illinois, Williams of Mississippi, Wilson of Ohio, Woodard—182.

ANSWERED "PRESENT"—Bailey, Edmunds, Jones, Kilgore—4.

NOT VOTING—Abbott, Allen, Apsey, Barthollett, Belden, Bell of Texas, Bonn, Bantner, Catchart, Catchings, Cushman, Cawwell, Cooper of Texas, Culbertson, Curtis of New York, Dunn, English of New Jersey, Fitch, Gear, Gillis of New York, Graham, Hale, Harter, Holmer of Pennsylvania, Hook, Johnson of Indiana, Johnson of Ohio, Linton, Maguire, Martin of Indiana, McCall, McDearmon, McDuffie, Milliken, Morse, Murray, Pomeroy, Phillips, Price, Rayner, Robinson of Pennsylvania, Rock, Sherman, Sweet, Tucker, Wendick, Weaver, Wilson of Washington—48.

Mr. Springer, of Illinois, moved to reconsider the vote and Mr. Hatch, of Missouri, moved to lay the motion to reconsider on the table. The motion to table was carried by a vote of 183 yeas to 124 nays.

On the next day the President sent to the Congress this message announcing the third sale of bonds:

To the Congress of the United States:

Since my recent communication to the Congress, calling attention to our financial condition and suggesting legislation which I deemed essential to our national welfare and credit, the anxiety and apprehension then existing in business circles have continued.

As a precaution, therefore, against the failure of timely legislative aid through congressional action, cautious preparations have been pending to supply in the best possible advantage in default of better means, such executive authority as may, without additional legislation, be exercised for the purpose of re-enforcing and maintaining in our Treasury an adequate and safe gold reserve.

In the judgment of those especially charged with this responsibility, the business situation is so critical and the legislative situation is so unsatisfactory, with the conviction thus far on the part of Congress to immediately enlarge the powers of the Secretary of the Treasury in the premises, as to require immediate executive action with the facilities now at hand.

Therefore, in pursuance of section 2700 of the Revised Statutes, the details of an arrangement have this day been concluded with parties abundantly able to fulfill their undertaking, whereby bonds of the United States, authorized under the act of July 14, 1877, payable in coin thirty years after their date, with interest at the rate of 4 per cent. per annum, to the amount of a little less than \$42,000,000, are to be issued for the purchase of gold coin, amounting to a sum slightly in excess of \$30,000,000, to be delivered to the Treasury of the United States, which sum, added to the gold now held in our reserves, will so restore such reserves as to make it amount to something more than \$100,000,000. Such a premium is to

be allowed to the Government upon the bonds as to fix the rate of interest upon the amount of gold realized at 34 per cent. per annum. At least one half of the gold to be obtained is to be supplied from abroad, which is a very important and favorable feature of the transaction.

The privilege is especially reserved to the Government to substitute at par within ten days from this date, in lieu of the 4-per-cent. coin bonds, other bonds in terms payable in gold and bearing only 3 per cent. interest, if the interest of the same should in the meantime be authorized by the Congress.

The arrangement thus completed, which, after careful inquiry, appears in present circumstances and considering all the objects desired to be the best attainable, develops such a difference in the estimation of investors between bonds made payable in coin and those specifically made payable in gold in favor of the latter as is represented by three fourths of a cent in annual interest. In the agreement just concluded the annual saving in interest to the Government, if 3-per-cent. gold bonds should be substituted for 4-per-cent. coin bonds under the privilege reserved, would be \$539,139, amounting in thirty years, or at the maturity of the coin bonds, to \$16,174,770.

Of course there never should be a doubt in any quarter as to the redemption in gold of the bonds of the Government which are made payable in coin. Therefore, the discrimination, in the judgment of investors, between our bond obligations payable in coin and those specifically made payable in gold is very significant. It is hardly necessary to suggest that, whatever may be our views on the subject, the sentiments or preferences of those with whom we must negotiate in disposing of our bonds for gold are not subject to our dictation.

I have only to add that in my opinion the transaction herein detailed for the information of the Congress promises better results than the efforts previously made in the direction of effectively adding to our gold reserve through the sale of bonds; and I believe it will tend, as far as such action can in present circumstances, to meet the determination expressed in the law repealing the silver-purchasing clause of the act of July 14, 1890, and that, in the language of such repealing act, the arrangement made will aid our efforts to "insure the maintenance of the parity in value of the coins of the two metals and the equal power of every dollar at all times in the markets and in the payment of debts."

GROVER CLEVELAND.

EXECUTIVE MANNION, Feb. 8, 1895.

On Feb. 13 the Committee of Ways and Means made a report to the House which contained the contract with the bond syndicate:

This agreement entered into this 8th day of February, 1895, between the Secretary of the Treasury of the United States, of the first part, and Messrs. August Belmont & Co., of New York, on behalf of Messrs. N. M. Rothschild & Sons, of London, England, and themselves, and Messrs. J. P. Morgan & Co., of New York, on behalf of Messrs. J. S. Morgan & Co., of London, and themselves, parties of the second part.

Witnesseth: Whereas it is provided by the Revised Statutes of the United States (section 3700) that the Secretary of the Treasury may purchase coin with any of the bonds or notes of the United States authorized by law, at such rates and upon such terms as he may deem most advantageous to the public interests; and the Secretary of the Treasury now deems that an emergency exists in which the public interests require that, as hereinafter provided, coin shall be purchased with the bonds of the United States, of the description hereinafter mentioned, authorized to be issued under the act entitled "An Act to provide for the redemption of specie payments," approved Jan. 14, 1875, being bonds of the United States described

in an act of Congress approved July 14, 1870, entitled "An Act to authorize the refunding of the national debt."

Now, therefore, the said parties of the second part hereby agree to sell and deliver to the United States 3,500,000 ounces of standard gold coin of the United States, at the rate of \$17.80441 per ounce, payable in United States 4-per-cent. thirty-year coupon or registered bonds, said bonds to be dated Feb. 1, 1895, and payable at the pleasure of the United States after thirty years from date, issued under the acts of Congress of July 14, 1870, Jan. 20, 1871, and Jan. 14, 1875, bearing interest at the rate of 4 per cent. per annum, payable quarterly.

First. Such purchase and sale of gold coin being made on the following conditions:

1. At least one half of all coin deliverable hereunder shall be obtained in and shipped from Europe, but the shipments shall not be required to exceed 300,000 ounces per month, unless the parties of the second part shall consent thereto.

2. All deliveries shall be made at any of the sub-treasuries or at any other legal depository of the United States.

3. All gold coins delivered shall be received on the basis of 25.8 grains of standard gold per dollar, if within limit of tolerance.

4. Bonds delivered under this contract are to be delivered free of accrued interest, which is to be assumed and paid by the parties of the second part at the time of their delivery to them.

Second. Should the Secretary of the Treasury desire to offer to sell any bonds of the United States on or before the 1st day of October, 1895, he shall first offer the same to the parties of the second part; but thereafter he shall be free from every such obligation to the parties of the second part.

Third. The Secretary of the Treasury hereby reserves the right, within ten days from the date hereof, in case he shall receive authority from Congress therefor, to substitute any bonds of the United States, bearing 3 per cent. interest, of which the principal and interest shall be specifically payable in United States gold coin of the present weight and fineness for the bonds herein alluded to; such 3-per-cent. bonds to be accepted by the parties of the second part at par, i. e., at \$18.60465 per ounce of standard gold.

Fourth. No bonds shall be delivered to the parties of the second part, or either of them, except in payment for coin from time to time received hereunder; whereupon the Secretary of the Treasury of the United States shall and will deliver the bonds as herein provided, at such places as shall be designated by the parties of the second part. Any expense of delivery out of the United States shall be assumed and paid by the parties of the second part.

Fifth. In consideration of the purchase of such coin, the parties of the second part, and their associates hereunder, assume and will bear all the expense and inevitable loss of bringing gold from Europe hereunder; and, as far as lies in their power, will exert all financial influence and will make all legitimate efforts to protect the Treasury of the United States against the withdrawals of gold pending the complete performance of this contract.

In witness whereof the parties hereto have hereunto set their hands in five parts this 8th day of February, 1895.

J. G. CARLISLE,

Secretary of the Treasury.

AUGUST BELMONT & Co.,

On behalf of Messrs. N. M. Rothschild & Sons, London, and themselves.

J. P. MORGAN & Co.,

On behalf of Messrs. J. S. Morgan & Co., London, and themselves.

Attest:

W. E. CURTIS.

FRANCIS LYNDY STETSON.

The report recommended that the suggestion of the President in favor of bonds payable "in gold" instead of "in coin" be adopted and the following joint resolution was submitted:

A joint resolution (H. Res. 375) authorizing the issue of \$65,114,275 of gold 3-per-cent bonds.

Resolved, etc., That the Secretary of the Treasury be, and he is hereby, authorized to issue and dispose of as not less than par in gold coin, bonds of the United States, with the qualities, privileges, and exemptions of bonds issued under the act approved July 14, 1870, entitled "An Act authorizing the refunding of the national debt," in an amount not exceeding \$65,114,275, bearing interest at a rate not exceeding 3 per cent, per annum, principal and interest payable in gold coin of the present standard of weight and fineness, said bonds to be made payable not more than three years after date: *Provided, however,* That no part of the proceeds of the sale of such bonds nor of the notes redeemed with such proceeds shall be available for the payment of the current expenses of the Government.

Mr. Wilson, of West Virginia, led in the debate in behalf of the resolution. He said:

"Mr. Speaker, it is important that in the beginning of this discussion the House should clearly understand the single issue presented in the resolution reported from the Committee on Ways and Means. Unless the debate can be held strictly to that issue and kept free from the larger and perplexing questions that naturally beset every financial discussion in this House, it may be impossible for the members to vote intelligently on the issue presented.

"The question is simply this: An emergency has arisen which, in the opinion of the Secretary of the Treasury, has made it incumbent on him to exercise the authority conferred upon him by law to purchase gold in order to re-enforce and maintain the traditional and legal gold reserve in the Treasury. He has exercised that authority through a contract made with certain responsible parties, under which he has purchased from them 4,500,000 ounces of gold of standard United States coin, for which he is to issue to them 4-per-cent, thirty-year coin bonds of the United States at such rate as to make the premium upon the bonds about 4½ per cent., and the right is reserved in the contract that should Congress authorize him to do so he may substitute for the bonds of the contract 3-per-cent, bonds at par specifically payable, principal and interest, in gold. The question is, will the House give him the authority to substitute such bonds for those he may issue under existing law?

"Now, Mr. Speaker, it is important, perhaps, that in laying the foundation for this discussion I should call the attention of the House to the emergency in the Treasury which has compelled the Secretary to make this contract.

"Any one who examines the Treasury statement this morning will find that so far as paying public expenditures is concerned the Treasury is in a very easy condition. There is an available cash balance of over \$141,000,000, and there is in the hands of the disbursing officers, which is really in the hands of the Treasury—for the money in the hands of the disbursing officers is but the tall money of the Treasury—there is in the hands of disbursing officers \$24,000,000 available for current payments. So that

this morning's report shows an available cash balance of over \$165,000,000. Compare that condition with the condition of the Treasury time and again in recent years, when there was no excitement or apprehension in the public mind, and it will be found that so far as its assets are concerned it is in a very easy condition.

"I have here a statement of the condition of the Treasury on the 31st day of May, 1892. I find on that day an available cash balance, including the gold reserve, of only \$128,000,000, whereas we have to-day \$141,000,000. There was then in the hands of disbursing officers only \$2,729,000, whereas we have to-day in their hands \$24,004,000, making an available cash balance in the Treasury to-day of \$165,000,000, as against \$129,000,000 on the 31st day of May, 1892.

"I might refer to other dates in the past few years when the Treasury was in much greater stress. This is, however, sufficient to satisfy the House, and ought to be sufficient to satisfy any man in the country, that there is no emergency so far as the Treasury itself is concerned. But when I come to examine this morning's statement of what is called the gold reserve in the Treasury, I find it to be only \$42,217,000. The Treasury as a bank of issue is in distress; the Treasury as a bank of issue has been for a year or more in distress, and because of its distress as a bank of issue it has been compelled to do that which any other safe and sound bank would do under like circumstances—that is, go out into the market to replenish the reserve which it keeps for the purpose of redeeming its current notes.

"Now, the condition of the gold reserve or the amount of that gold reserve has from time to time varied in the history of our fiscal and banking operations.

"So perfect was the confidence of the country when the Treasury resumed specie payments in 1879 that between the 1st day of January, 1879, and the 1st day of November there were presented for redemption less than \$12,000,000 of the notes of the Government; and during the entire twelve months that followed, from Nov. 1, 1879, to Nov. 1, 1880, there were presented for redemption under the resumption law but a little over \$700,000 of the notes of the United States; and during all that time, instead of gold being drawn out of the Treasury, there was a steady flow of gold into the Treasury under the inevitable operation of that law of trade that where paper is known to be as good as gold business men always insist on having the paper instead of the gold.

"There have been times, as I have said, when this gold reserve ran down. A very critical time came in the panic of 1890, when, according to Secretary Windom, in the speech which he made in the city of New York the night he died, there was during the previous November (November, 1890) a run on the gold reserve to the amount of \$54,000,000. I may state also that he called attention in his annual report of 1890 to the fact that during the crisis of the panic of 1890 the Treasury was virtually reduced, so far as available cash assets for the payment of its debts were concerned, to the \$54,000,000 of the banking trust fund, which,

under the operation of the Sherman law of the previous July, had been passed to the cash of the Treasury.

"It thus being by law, Mr. Speaker, and by the policy of the Treasury Department ever since the resumption of specie payments began, the recognized safe and sound practice to maintain in the Treasury of the United States at least \$100,000,000 of gold, or a sufficient amount of gold to maintain the redemption of the obligations of the Government that are redeemable in gold, it has three times within the last thirteen months become necessary for the Treasury of the United States to go into the market and purchase gold, as any other banker would have to do, to maintain its reserve. Twice in twelve months it has issued and sold in this country \$50,000,000 of 5-per-cent. coin obligations of the Government, getting into the Treasury for them something over \$117,000,000. But that experiment, as every one can now see, was only a makeshift, and a very brief and futile makeshift in itself.

"The gold acquired last January was taken out of the Treasury before November. The gold bought last November has been taken out of the Treasury in two months, so that any one can see that these previous bond issues have simply resulted in exchanging our gold for our own bonds. Under these circumstances it became necessary for the Secretary of the Treasury, in order to maintain the gold reserve at the sum required by law, in order to maintain a ready and instantaneous redemption of the legal-tender-note obligations of the Government, in order to carry out the pledge contained in the Sherman law and in the law that repealed the Sherman law, to maintain at a parity all the coin circulation of this country, I say it became necessary for the Secretary of the Treasury to seek some other supply of gold than that he could obtain in this country. Under these circumstances Secretary Carlisle has done just what Secretary Sherman did, time and again, when he was refunding the public debt; just what he did when he was gathering the gold to make up this reserve in the Treasury; he has sought to purchase gold from other markets than our own.

"Now, Mr. Speaker, there is one point, perhaps, which I can state appropriately here, though not directly in the line of my remarks. I have said that Secretary Sherman kept a gold reserve of 40 per cent., and declared in successive reports that he believed 40 per cent. was the necessary and safe reserve. When that \$100,000,000 was set apart; when the \$100,000,000, by what seemed to be the instruction of Congress in 1882 was set apart, it was a gold reserve fund for the redemption of the greenbacks outstanding, \$346,000,000, and for the support of \$200,000,000 or more of standard silver dollars then in circulation.

"But to-day \$100,000,000 gold in the Treasury would be a reserve fund, first, for the redemption of \$500,000,000 of outstanding legal-tender notes of the Government; then, of \$500,000,000 outstanding overvalued silver coins; and in addition to that, under the operation of the present national banking law, of all the notes of all the national banks of the country. If 40 per

cent. was a proper and sufficient banking reserve in 1879 and 1880, no man can complain that, with these added charges and these additions to the redeemable notes of the Government, \$100,000,000 is now more than a very modest reserve.

"There is a contract made under which gold to-day is being put into the subtreasuries, a contract under which gold is to-day being loaded on shipboard to come to this country, a contract which is complete in itself and can not be set aside, because made under ample authority of existing law. The only question is whether we shall exercise our option to substitute for a thirty-year 4-per-cent. coin bond a thirty-year, or less, 3-per-cent. gold bond. And the effect of that is simply this: That as every coin contract made in this country since the resumption of specie payments is in truth a gold contract, we are saving half a million dollars a year without any additional burden or liability on the Government.

"Mr. Speaker, I repeat that this is simply a question of saving a half million of dollars a year in interest to the people of the United States. The gold dollar has been the standard of payment in this country by operation of law for twenty-five years. There is not a contract made by a member of Congress for the payment of money, there is not a contract in this country to-day, where the money is not actually specified, that is not a gold contract. Gold is the standard—the legal standard—by which all contracts are paid in this country, whether the payment be in gold or not, and gentlemen constantly confuse in their discussions on this floor a very important distinction between the standard of payment and the currency of payment."

Mr. Hopkins, of Illinois, led in opposition to the measure. He said:

"Mr. Speaker, the gentleman from West Virginia who has just addressed the House in favor of this proposition that is pending under the special rule adopted to-day devoted considerable time in justification of the Administration in issuing bonds and replenishing the Treasury thereby. I shall take no time in attempting to answer him on that proposition. That, as I understand it, is not the question presented to the House to pass upon.

"We have been informed by the President of the United States, in a special message to Congress which was read here a few days ago, that a contract has been already made for the issuance of bonds; and the question submitted to us is not whether a new loan shall be negotiated and new bonds issued, but whether this Congress will authorize the President to change the policy of the Government and issue a gold bond.

"I am opposed to this resolution because I am opposed to this Government at this late day in our financial transactions changing its policy with reference to the issuance of bonds; and in view of my opposition I desire the attention of the House for a brief period only to give some of the reasons that impel me to hold that position.

"During the long period the Republican party controlled this country, commencing, as it did, in the early days of secession, during all the dark and stormy period of war and up to a few years ago, it was enabled to enact laws and adopt

measures to replenish the Treasury and furnish the necessary means to pay the expenses of the Government without a resort to the extraordinary methods that have been adopted by President Cleveland and his Secretary of the Treasury in the contract that is before us to-day.

For more than thirty-five years the settled policy of this Government has been to issue our Government bonds payable in coin. The bonds that have been heretofore issued are not payable in gold or silver, or greenbacks, but are payable in coin. Now, the gentleman who has just addressed the House says that the established construction of these bonds is that 'coin' means 'gold,' and that it is just as well to put the word 'gold' in there as it is to put in the word 'coin.' If that be true, and President Cleveland and his Secretary of the Treasury understood that when they were negotiating this loan of \$65,000,000 with this syndicate, why did they not call the attention of the syndicate to this fact and let them understand that the Government would not deviate from its settled policy, but that the bonds would be paid in gold, as the gentleman says.

"It seems to me that the time to urge this argument is not here upon the members of the House and Senate and the country, but was with these foreign capitalists when the negotiation for the bonds was pending. They should have been informed that the Government of the United States has a settled policy on this bond question, and that the people of this country have never repudiated their obligations.

"I desire, Mr. Speaker, to call the attention of members of this House to the fact that the Republican party in negotiating loans reduced rates of interest year after year during the whole history of bond issues. When Judge Folger, of New York, was the Secretary of the Treasury in 1882 he extended \$300,000,000 of our obligations for 3 per cent. on a coin bond at a time when the condition of our country was not as good as it is to-day, at a time when we did not have as vast industries, as great wealth, as we have stored away in the vaults of private individuals and corporations and in the great banks of the country. That vast sum of \$300,000,000 was negotiated, not with a foreign syndicate, not by a private contract with the law partner of the President as legal adviser of the syndicate making the loan, but it was negotiated in the open sunlight, and with the American people, at a rate of only 3 per cent. interest.

"Mr. Speaker, I am opposed to this change in the condition of the bonds because, in my judgment, it will destroy the credit of the United States. The President, in his message to Congress, has said that by adopting this resolution and approving of this gold contract more than \$16,000,000 will be saved to the Government in thirty years that the bonds are stipulated to run. I say, Mr. Speaker, in my humble judgment, instead of being a saving to the Government of the United States, that in the years to come it would cost more than \$100,000,000 to change the character of our Government obligations.

"This country is in many respects like an individual engaged in business, young, energetic, and aggressive. Such a business man must be a debtor, and must have any number of creditors. If he is a good business man he issues the same

kind of an obligation to all of his creditors, and simply issues an evidence of indebtedness to all the people from whom he borrows money or with whom he deals or enters into obligations. But, sir, if this business man should happen on a fatal day to walk into a broker's shop and ask for a loan and should agree to give a mortgage upon his property as security, that moment his credit would be destroyed. No other creditor would allow him money or credit without his giving as good security as the broker exacted, and the creditors that already existed, instead of extending their obligations and giving him time, would insist upon the payment of their money, and the result would be that by the change of his policy the prosperous business man would be made a bankrupt.

"Now, the same thing would occur to the Government of the United States. No new loan could be made in other than gold bonds, while the holders of the coin bonds now out would insist that their bonds must be changed to gold ones. Under the policy that we have adopted the holders of these coin bonds are directly interested in maintaining the integrity of our financial system. They know that while the coin bonds have always been paid in gold under Republican administrations and under the present Administration, yet that there is still a strong party in this country which believes that those obligations could be paid in silver and the letter of the bonds be kept. Hence, the holders of the Government coin bonds are interested in maintaining the parity of the two metals. They are interested in seeing that the money of the Government—greenbacks, silver, and gold—shall be of like value.

"But, sir, if you should adopt the recommendations of the President in this message, and give him the power of issuing a gold bond, you would destroy this principle that operates to control the bondholder to-day and you would make him a bear upon the market. The bondholder whose bond reads 'payable in gold' is directly interested in driving this Government upon a silver basis.

"Why do I say that? Because if he can drive gold to a premium and drive this Government upon a silver basis he enhances the value of the bond that is payable in gold. The moment that this \$62,000,000 mentioned in the President's message were issued in gold bonds you would have August Belmont & Co. and J. S. Morgan & Co. and the Rothschilds and their financial agents in London directly interested in looting the Treasury of the United States of its gold, in destroying the financial stability of our Government, and in driving us upon a silver basis, because they thereby could double the value of their bonds.

"What a remarkable attitude the President and his Secretary of the Treasury are in! They are stating to the public that this loan is to replenish the Treasury so as to maintain the parity of the metals, gold and silver, and to do this are trying to induce Congress to authorize them to issue a gold bond.

"It seems to me, Mr. Speaker, that these considerations are sufficient to show that the paltry sum of \$16,000,000 that has been suggested in the President's message ought not to have any

weight with the members of this House in determining their vote upon this question. Certainly it ought not to have any weight with the Republican members of this House, when they know from the earliest history of the Republican party we have had but one policy upon this question, and that policy has carried this country on in a course of prosperity and financial and industrial success that has been the marvel of the world.

"Now, Mr. Speaker, I have suggested these few considerations in a general way for the reason of my opposition to this measure. When we come to consider the character of the contract that has been entered into by the Secretary of the Treasury, we find reasons that are too numerous to mention why we should not give it our sanction by an affirmative vote in this House. Why, Mr. Speaker, it is one of the most remarkable contracts that was ever entered into by this Government with any private corporation, either foreign or domestic. What is it? It is a contract, in the first place, that has been made in private. Heretofore the obligations of the Government had been entered into in the open market, with the entire American public taken into the confidence of the Administration. Even the loans that have been previously made by this Administration have been of that character.

"The gentleman from West Virginia has stated that \$117,000,000 has been placed in the Treasury of the United States by the two loans that have been made within less than a year by this Administration. Those loans were not made in secret with a foreign syndicate. They were made with the American people in the light of day, with every American citizen having the privilege of sending his bid to the Treasury of the United States and adding his sum of money to replenish the Treasury of the United States. Mr. Speaker, what has been the result of this policy? The result is that loans have been made for less than 3 per cent. on ten-year bonds. For less than 3 per cent. on coin ten-year bonds; and here we have a contract entered into secretly between a banking concern in New York and one in London, not for a ten-year bond, not for a fifteen-year bond, but for a thirty-year bond, and one that may, under its terms, run for a hundred years; a bond, Mr. Speaker, that requires the Government of the United States to pay $3\frac{1}{2}$ per cent. interest, and that interest is to be paid quarterly.

"On the very day that this contract was signed, on the very day that the President of the United States sent his message to Congress, holding up this bribe of \$16,000,000 to the House and the Senate for their approval, like bonds were selling in the open market, with only twelve years to run, at 110 $\frac{1}{2}$. This syndicate bought them at 104 $\frac{1}{2}$, payable thirty years after their date.

"Mr. Carlyle admitted, when he was before the Committee on Ways and Means, that on the same basis, with thirty years to run, the market value of these bonds at the time when he made this contract with this foreign syndicate was 119 $\frac{1}{2}$. In other words, the President and his Secretary sold these bonds for \$9,500,000, in round numbers, less than they were selling for in the open market. Then he gave a rate of interest on the bonds higher than any civilized

country in the world is paying to-day for its new obligations. Even bankrupt Egypt has negotiated her loans for less than the figures that the President and his Secretary have given to this syndicate of brokers. The richest, the grandest, and the proudest country in the world under the rule of Democracy has been reduced to this low estate.

"They have given a higher rate of interest than little Norway, Belgium, France, or England pay on their obligations. They have given a higher rate of interest than the British provinces are compelled to pay; and yet they come in here, after having negotiated this secret loan, and ask the American Congress to confirm them in this contract with these concessions to Belmont & Co., of New York, and Rothschild & Co., of London. When President Cleveland penned that message and sent it to Congress it was not for patriotic, but political purposes.

"He wanted to throw the responsibility upon Congress of approving an indefensible contract with this syndicate that was represented in the negotiations by his former law partner.

"Now, let us see what this syndicate will make by this contract, negotiated in the manner I have indicated. They make \$9,500,000, in round numbers, when the contract is signed. The President says they will make over \$16,000,000 at the expiration of the period the bonds run."

On Feb. 14 the motion for the engrossment and third reading of the joint resolution was defeated by the following vote:

YEAS—Adams of Pennsylvania, Aldrich, Apsley, Babcock, Baldwin, Barnes, Bartholdt, Barwig, Beckner, Beltzhoover, Berry, Breekinridge, Brickner, Brosius, Bynum, Cadmus, Campbell, Caruth, Catchings, Causey, Chickering, Clancy, Clarke of Alabama, Cobb of Missouri, Coombs, Cooper of Florida, Cooper of Indiana, Cornish, Covert, Crain, Curtis of New York, Daniels, Davey, De Forest, Dingley, Draper, Dunn, Durbin, English of California, Erdman, Everett, Fielder, Forman, Geary, Geissenhainer, Gillet of New York, Gillet of Massachusetts, Goldzier, Gorman, Graham, Gresham, Griffin of Michigan, Grout, Haines, Hall of Minnesota, Hammond, Harrison, Hayes, Hendrix, Henry, Kribbs, Lapham, Lefever, Lockwood, Lynell, Martin of Indiana, Marvin of New York, McCreary of Kentucky, McGann, McKaig, Meyer, Montgomery, Morse, Mutchler, O'Neil of Massachusetts, O'Neill of Missouri, Page, Paschal, Patterson, Payne, Pearson, Pendleton of West Virginia, Pigott, Powers, Price, Quigg, Ray, Reed, Reilly, Reyburn, Richards, Robinson of Pennsylvania, Russell of Connecticut, Ryan, Schermerhorn, Sickles, Sorg, Sperry, Springer, Stevens, C. Stone, Stone of Kentucky, Storer, Straus, Tarsney, Tracey, Turner of Georgia, Turpin, Updegraff, Wadsworth, Wanger, Warner, Washington, Wells, Wilson of West Virginia, Wise, Wolverton, Wooster, Wright—120.

NAYS—Adams of Kentucky, Aitken, Alderson, Alexander, Allen, Arnold, Avery, Bailey, Baker of Kansas, Baker of New Hampshire, Bankhead, Bell of Colorado, Bell of Texas, Black, Blair, Eland, Boatner, Boen, Bowers of California, Bretz, Broderick, Bromwell, Brookshire, Brown, Bryan, Bundy, Bunn, Caminetti, Cannon of California, Cannon of Illinois, Capelhart, Clark of Missouri, Cobb of Alabama, Cockrell, Coffeen of Wyoming, Coffin of Maryland, Cooper of Wisconsin, Cox, Crawford, Curtis of Kansas, Davis, De Armond, Denson, Dinsmore, Dockery, Dolliver, Donovan, Doolittle, Edmunds, Ellis of Kentucky, Ellis of Oregon, Enloe, Epes,

Fletcher, Funk, Fyau, Goodnight, Grady, Griffin of Wisconsin, Grosvenor, Grow, Hager, Halner, Hall of Missouri, Hare, Harris, Hartman, Hatch, Haugen, Hoad, Henderson of Illinois, Henderson of Iowa, Hepburn, Hermann, Hill, Hooker of Mississippi, Hopkins of Illinois, Hopkins of Pennsylvania, Hudson, Hudick, Hull, Hunter, Hutchinson, Isart, Islar, Jackson of South Dakota, Kane, Kiefer, Kyle, Lacey, Lane, Latimer, Lawson, Layton, Lester, Linton, Little, Livingston, Lord, Longmire, Luman, Maddox, Maguire, Mahon, Mallory, Marsh, McHenry of Minnesota, McCullough, McDermott, McKelish, McLaurin, McKim, McNulty, McKim, McKelish, Mercer, Merritt, Mosey, Moore, Morgan, Moss, Nall, Northway, Ogden, Paine, Pendleton of Texas, Perkins, Pickler, Randall, Richardson of Michigan, Richardson of Tennessee, Ritchie, Robbins, Robertson of Louisiana, Russell of Georgia, Sayre, Seale, Shell, Shibley, Simpson, Smith, Stevenson, Stallings, Stephenson, Stockdale, Street, Strong, Swanson, Talbot of South Carolina, Tate, Tamm, Taylor of Indiana, Terry, Thomas, Tyler, Van Voorhis of New York, Van Voorhis of Ohio, Walker, Waugh, Woodcock, Wheeler of Alabama, Wheeler of Illinois, Whiting, Williams of Illinois, Williams of Mississippi, Wilson of Ohio, Wilson of Washington—187.

AYES—187. **PRESENT**—Henderson of North Carolina, Rogers—2.

NOT VOTING—Abbott, Bartlett, Belden, Bingham, Bonville, Bowers of North Carolina, Branch, Burton, Cabaniss, Childs, Chickens, Cogswell, Combs, Cooper of Texas, Cousins, Cullerton, Dainell, Dunphy, English of New Jersey, Fithian, Gardner, Geat, Harner, Harter, Helmer, Hicks, Hines, Holmes, Hooker of New York, Hawk, Johnson of Indiana, Johnson of Ohio, Jones, Magner, Marshall, McAuliffe, McCall, McDermott, McDowell, McFetrick, Milliken, Moon, Murray, Newlands, Ostrander, Phillips, Rayner, Reek, Scrantom, Sherman, Rips, Somers, Sweet, Talbot of Maryland, Taylor of Tennessee, Tucker, Turner of Virginia, Weyer, White, Woodard—40.

Mr. Bland, of Missouri, moved to reconsider the vote, and then moved to lay the motion to reconsider on the table. The motion to table was carried, and the joint resolution put beyond resurrection.

Silver Coinage.—Jan. 23, 1895, Mr. Jones, of Arkansas, introduced in the Senate a bill "providing for the issue of bonds, the coinage of silver, and other purposes," which was referred to the Committee on Finance, and reported with amendments Feb. 12. The new measure was entitled "a bill providing for the unrestricted coinage of silver, and for other purposes"; and was as follows:

That from and after the passage of this act the Secretary of the Treasury is hereby authorized and directed to receive at any United States mint, from any citizen of the United States, silver bullion of standard fineness, and coin the same into silver dollars of 412½ grains each. The seigniorage on the said bullion shall belong to the United States, and shall be the difference between the coinage value thereof and the market price of the bullion in New York on the day the deposit is made, and all expenditures for coinage done under the provisions of this act shall be paid out of said seigniorage; and the Secretary of the Treasury shall deliver to the depositors of such bullion standard silver dollars equal in amount to the price thereof as aforesaid; and whenever the said coins herein provided for shall be received into the Treasury, certificates may be issued thereon, in the manner now provided by law.

The advocates of the measure made a strong effort in its behalf, and after a great deal of skirmishing, it was taken up for consideration Feb. 18, by the following vote:

YEAS—Allen, Fiske, Berry, Blackburn, Butler, Call, Cameron, Clark, Daniel, Doolittle, Hammon, Harbo, Hunter, Jones of Arkansas, Jones of Nevada, Kyle, McLaurin, Maule, Morgan, Peffer, Perkins, Pettigrew, Pugh, Revere, Stewart, Teller, Turpin, Voorhis, Walsh, White—30.

NAYS—Allison, Brown, Camden, Carey, Chandler, Davis, Dixon, Frye, Gallinger, George, Gilman, Gray, Hale, Hawley, Hill, Hoar, McMillan, McPherson, Manderson, Mitchell of Wisconsin, Palmer, Patten, Platt, Proctor, Quay, Ransom, Vilas—47.

NOT VOTING—Aldrich, Blaine, Brewster, Caffery, Chandler, Coke, Collins, Dolph, Fairbank, Gardner, German, Higgins, Irish, Lindsay, Lodge, Martin, Mills, Mitchell of Oregon, Morrill, Murphy, Power, Pritchard, Russell, Sherman, Shoup, Smith, Vest, Washburn, Wilson, Wolcott—36.

On the same motion the next day the vote was yeas 30, nays 27; but the motion, though continued until 9 o'clock at night, brought about no result, as the opponents of the measure resorted to filibustering tactics. Feb. 20, Mr. Jones gave up all idea of passing the bill, and laid it aside to make way for the appropriation bills.

Japanese Matters.—The President transmitted to the Senate Dec. 6, 1894, a new treaty with Japan negotiated on Nov. 22, and the Senate approved of it with the proviso for its abrogation on one year's notice by either party.

The preamble declares that, in order to preserve the good understanding and increase the intercourse between the countries, a revision of the treaties hitherto adopted should be made on the basis of the principles of equity and mutual benefit.

Article I provides that the citizens or subjects of each of the contracting parties shall be free to enter, travel, or reside in any part of the territories of the other, and shall enjoy perfect protection for their persons and property; that they shall have free access to the courts of justice in pursuit or defense of their rights, on the same footing as native citizens or subjects; that in the rights of residence, travel, possession of goods, succession or transmission of personal estate, they shall enjoy without discrimination the privileges, rights, and liberties of native citizens or subjects, or those of the most favored nation; that they shall enjoy liberty of conscience under the law, public or private exercise of worship, and the right of burial according to their religious customs; that they shall not pay any discriminating charges or taxes whatsoever on any pretext; and that they shall be exempt from all compulsory military services, forced loans, or military exactions or contributions.

Article II provides for reciprocal freedom of commerce and navigation between the territories of the high contracting parties, making specific statements covering the method and means of such commerce, and only exempting from these stipulations "the law or ordinances with regard to trade, the immigration of laborers, police, and public security which are in force or which may be hereafter enacted in either by the two countries."

Article III provides for the immunity of the dwellings, manufactories, warehouses, and shops of the citizens or subjects of either party within the territories of the other, except under the conditions and forms of law in force for native citizens or subjects.

Article IV provides that there shall be no dis-

eliminating import duties; but its terms are not applicable to sanitary and other prohibitions necessary for the protection of persons, of cattle, or of plants useful in agriculture.

Article V provides that there shall be no discriminating export duties; and Article VI provides that there shall be exemption from transit duties and equal rights with native citizens or subjects in all that relates to warehousing, bounties, facilities, and drawbacks.

Article VII gives United States vessels the right to carry into Japanese ports all articles that Japanese vessels may lawfully carry, on like conditions, and the privilege is reciprocal. The same equality is established as to the export trade.

Articles VIII and IX provide against discriminating duties, tonnage, harbor, pilotage, light-house, quarantine, or other similar charges; and against discrimination in the stationing, loading, and unloading of vessels in ports, basins, docks, roadsteads, harbors, or rivers.

Article X provides that each country exempts its coasting trade from these stipulations, but agrees to grant to the other the rights granted to the citizens or subjects of any other country. Vessels of the United States, however, may carry cargoes between the open ports of Japan during the existence of the present treaty, Osaka, Ni-gata, and Ebesumato being excepted.

Article XI makes equitable and beneficent provisions in regard to the refitting of vessels, wrecks, and salvage.

Article XII defines United States and Japanese vessels; Article XIII directs that consuls shall receive from local authorities whatever help can be lawfully given in recovering deserters from vessels; Article XIV provides that each of the high contracting parties shall concede to the government, ships, citizens, or subjects of the other any privilege, favor, or immunity, in commerce or navigation, hitherto given or hereafter given to the government, ships, citizens, or subjects of any other nation, the aim of each being to place the other on the footing of the most favored nation; and Article XV provides for the appointment of consuls and consular agents in all ports, cities, and places, except those where it may not be convenient to recognize such officers, but such exceptions when made shall apply to all other nations, and the consuls and consular agents of each of the high contracting parties shall enjoy all the privileges, exemptions, and immunities granted to the consular agents of the most favored nation.

Article XVI provides that the citizens or subjects of each of the high contracting parties shall enjoy in the territories of the other the same protection as native citizens or subjects in regard to patents, trademarks, and designs upon the fulfillment of the formalities prescribed by law.

Article XVII provides that all foreign settlements in Japan shall be merged into Japanese communities from the date on which the treaty goes into force, and form part of the municipal system of Japan, subject to competent Japanese authorities; leases held in such settlements in perpetuity to be continued on existing terms; and lands granted by the Japanese Government for public purposes free of rent being reserved free of all taxes and charges for such purposes.

Article XVIII declares that this treaty, from the day on which it goes into force, shall be substituted for all previous treaties, each one of which is specifically described: "And from the same date such treaties, conventions, arrangements, and agreements shall cease to be binding, and, in consequence, the jurisdiction then exercised by the courts of the United States in Japan and all the exceptional privileges, exemptions, and immunities there enjoyed by citizens of the United States as a part of or appurtenant to such jurisdiction shall absolutely and without notice cease and determine, and thereafter all such jurisdiction shall be assumed and exercised by Japanese courts.

Article XIX provides that the treaty shall go into effect July 17, 1899, continue for twelve years, and cease and determine at that period on notice given by either party after the expiration of the eleventh year.

A protocol was added which provided that the existing tariff in Japan on American goods shall cease to be binding one month after the ratification of the treaty, and that the tariff regulations of the treaty of March 31, 1854, be made applicable, nothing in the protocol, however, to be construed as limiting the right of the Japanese Government to prohibit any importations that may threaten moral or sanitary security. It regulates also the terms on which citizens of the United States may visit interior points in Japan, pending the opening of the country to them in accordance with the treaty.

Dec. 5, 1894, Mr. Lodge, of Massachusetts, introduced in the Senate the following resolution:

Resolved, That the President be requested, if not incompatible with the public interest, to transmit to the Senate all correspondence or other papers relating to the delivery by the United States consul at Shanghai of two Japanese citizens to the Chinese authorities, and also to inform the Senate whether the said Japanese were put to death after being tortured; and whether there was any understanding with the Chinese Government that officers of the United States should aid, assist, and give safe conduct to any Japanese citizen desiring to leave China; and, further, to inform the Senate whether the United States consul at Hankow was reprimanded by Chinese officials for aiding Japanese citizens to leave the country, and whether all information was refused to the United States consul at Nangpo when he made inquiries as to the charges against certain Japanese citizens arrested there.

The resolution was referred to the Committee on Foreign Relations after a brief discussion, reported back, and passed; and in due time the correspondence was submitted.

Armenian Massacres.—Dec. 11, 1894, in response to a resolution of the Senate asking for information as to the massacres in Armenia, the President sent the following message:

To the Senate of the United States:

I have received a copy of the following resolution of the Senate passed on 3d instant:

"Resolved, That the President be requested, if in his judgment it be not incompatible with the public interest, to communicate to the Senate any information he may have received in regard to alleged cruelties committed upon Armenians in Turkey, and especially whether any such cruelties have been committed upon citizens who have declared their intention to become naturalized in this country, or upon persons because of their being Christians.

"And further, to inform the Senate whether any

expectations have been addressed by this Government to the Government of Turkey in regard to such matters, or any proposals made by or to this Government to act in concert with other Christian powers regarding the same."

In response to said resolution I beg leave to inform the Senate that I have no information concerning cruelties committed upon Armenians in Turkey or upon persons because of their being Christians, except such information as has been derived from newspapers and statements emanating from the Turkish Government denying such cruelties, and two telegraphic reports from our minister at Constantinople.

One of those reports, dated Nov. 26, 1894, is in answer to an inquiry by the State Department touching reports in the press alluding to the killing of Armenians, and is as follows:

"Reports in American papers of Turkish atrocities at Samsun are sensational and exaggerated. The killing was in a conflict between armed Armenians and Turkish soldiers. The grand vizier says it was necessary to suppress insurrection, and that about 30 Turks were killed between 300 and 400 Armenian were picked up after the fight, and reports that about that number of Armenians were killed. I give credit to his statement."

The other dispatch referred to is dated Dec. 2, 1894, and is as follows:

"Information from British ambassador indicates far more loss of lives in Armenia attended with atrocities than stated in my telegram of 26th."

I have received absolutely no information concerning any cruelties committed upon citizens who have declared their intention to become naturalized in this country, or upon any persons who had a right to claim or have claimed for any reason the protection of the United States Government.

In the absence of such authentic detailed knowledge on the subject as would justify our interference, no expectations have been addressed by this Government to the Government of Turkey in regard to such matters."

The last inquiry contained in the resolution of the Senate touching these alleged cruelties seeks information concerning "any proposals made by or to this Government to act in concert with other Christian powers regarding the same."

The first proposal of the kind referred to was made by the Turkish Government through our minister on the 30th day of November, when the Sultan then expressed a desire that a commission of the United States be sent with a Turkish commission to investigate those alleged atrocities on Armenians. This was construed as an invitation on the part of the Turkish Government to actually take part with a Turkish commission in an investigation of those affairs and any report to be made thereon, and the proposition came before our minister's second dispatch was received and at a time when the best information in the possession of our Government was derived from his first report, indicating that the statements made in the press were sensational and exaggerated and that the atrocities alleged really did not exist. This condition very much weakened any motive for an interference based on considerations of humanity, and permitted us without embarrassment to pursue a course plainly marked out by other controlling incidents.

By a treaty entered into at Berlin in the year 1878 between Turkey and various other governments, Turkey undertook to guarantee protection to the Armenians, and agreed that it would "periodically make known the steps taken in this effect to the powers, who will superintend their application."

Our Government was not a party to this treaty, and it is entirely obvious that in the face of the provisions of such treaty above recited our interference in the proposed investigation, especially without the invitation of any of the powers which had assumed by treaty obligations to secure the protection of those Armenians, might have been exceedingly embarrass-

ing, if not entirely beyond the limits of justification or propriety.

The Turkish invitation to join the investigation set on foot by that Government was therefore on the 30 day of November declined. On the same day, and after this declaration had been sent, our minister at Constantinople forwarded his second dispatch, tending to modify his former report as to the extent and character of Armenian slaughter. At the same time the request of the Sultan for our participation in the investigation was repeated, and Great Britain, one of the powers which joined in the Treaty of Berlin, made a like request.

In view of changed conditions and upon reconsideration of the subject, it was determined to send Mr. Jewett, our consul at Bivas, to the scene of the alleged outrages, not for the purpose of joining with any other governments in an investigation and report, but to the end that he might be able to inform this Government as to the exact truth.

Instructions to this effect were sent to Mr. Jewett, and it is supposed he has already entered upon the duty assigned him.

I submit with this communication copies of all correspondence and dispatches in the State Department on this subject, and the report to me of the Secretary of State thereon.

GROVER CLEVELAND.

EXECUTIVE MESSAGES, JAN. 11, 1895.

Great Britain and Venezuela.—Touching the British-Venezuela boundary dispute, the Congress passed the following resolution:

Resolved by the Senate and House of Representatives, etc. That the President's suggestion, made in his last annual message to this body—namely, that Great Britain and Venezuela refer their dispute as to the boundaries to friendly arbitration—be earnestly recommended to the favorable consideration of both parties in interest.

Hawaii.—The affairs of Hawaii occupied a great share of congressional attention; and the Senate discussed a resolution of inquiry as to the withdrawal of the United States war ships, a resolution relative to the government of the islands, a resolution favoring annexation, a resolution expressing regret at the attempt to restore the deposed queen, and a resolution favoring a station of the United States war ships. The President sent to the Senate the following message in regard to a grant to an English cable company:

To the Senate and House of Representatives:

I submit herewith certain dispatches from our minister at Hawaii and the documents which accompanied the same.

They disclose the fact that the Hawaiian Government desires to lease to Great Britain one of the uninhabited islands belonging to Hawaii as a station for a submarine telegraphic cable, to be laid from Canada to Australia, with a connection between the island island and Honolulu.

Both the Hawaiian Government and the representatives of Great Britain in this negotiation concede that the proposed lease can not be effected without the consent of the United States, for the reason that in our treaty treaty with the King of Hawaii he agreed that as long as said treaty remained in force he would not "lease or otherwise dispose of or create any lien upon any port, harbor, or other territory in his dominion or grant any special privilege or right of use therein to any other power, state, or government."

At the request of the Hawaiian Government this subject is laid before the Congress for its determination upon the question of so modifying the treaty agreement above recited as to permit the proposed lease.

It will be seen that the correspondence which is

submitted between the Hawaiian and British negotiators negatives the existence on the part of Hawaii of any suspicion of British unfriendliness or the fear of British aggression.

The attention of the Congress is directed to the following statement contained in a communication addressed to the Hawaiian Government by the representatives of Great Britain:

"We propose to inform the British Government of your inquiry whether they would accept the sovereignty of Nicker Island or some other uninhabited island on condition that no subsidy is required from you. As we explained, we have not felt at liberty to entertain that question ourselves, as we were definitely instructed not to ask for the sovereignty of any island, but only for a lease simply for the purpose of the cable."

Some of the dispatches from our minister, which are submitted, not only refer to the project for leasing an uninhabited island belonging to Hawaii, but contain interesting information concerning recent occurrences in that country and its political and social condition. This information is valuable because it is based upon the observation and knowledge necessarily within the scope of the diplomatic duties which are intrusted solely to the charge of this intelligent diplomatic officer representing the United States Government at Hawaii.

I hope the Congress will see fit to grant the request of the Hawaiian Government, and that our consent to the proposed lease will be promptly accorded. It seems to me we ought not by a refusal of this request to stand in the way of the advantages to be gained by isolated Hawaii through telegraphic communication with the rest of the world, especially in view of the fact that our own communication with that country would thereby be greatly improved without apparent detriment to any legitimate American interest.

GROVER CLEVELAND.

EXECUTIVE MANSION, Jan. 9, 1895.

The Senate did not act on this suggestion further than to add to an appropriation bill a provision for an American cable line to Hawaii.

The Seal Question.—The Bering Sea question was discussed under various forms; but there was a test vote on the payment of damages "to the Government of Great Britain under the agreement reached by exchange of notes of Aug. 21, 1894, in full satisfaction of all demands for damages against the United States growing out of the controversy between the two governments as to the fur seals in Bering Sea under the award and findings of the tribunal of arbitration at Paris, \$425,000.

Mr. Breckinridge, of Kentucky, moved to include that item in the general deficiency appropriation bill, and said in regard to the claims made by the owners of sealing vessels:

"These vessels sailed under the British flag and were seized outside of the 3-mile limit, which covered the jurisdiction of the American Government. It was, however, expressly understood that the citizenship of the owners of the vessels and the actual damage done should be left open for litigation and settlement between the two contracting powers. So that the only question left by the arbitrators is the assessment of damages.

"I believe that I have stated the general case exactly. If not, I will gladly be corrected. The British minister filed claims amounting to \$542,000, reserving the privilege of filing additional claims, and proposed to have them settled by a convention of arbitrators. Of these claims, it is alleged that a certain amount, somewhat in

doubt, but I believe somewhere about \$300,000, was for what is called consequential damages.

"Upon none of these claims has interest been added. So that we were in this condition: There was a judgment against us, with nothing left but the assessment of damages. There were claims of \$542,000, with interest from 1886 and various other dates, up to 1889, I believe none later than 1890, so that the average time would be about the beginning of January, 1888, and the right to file additional claims of any amount.

"Among these claims were many for false imprisonment, and these are still open to additional claims. The sum that was agreed upon is \$425,000. If we admit that this \$300,000 is a disputed claim, and that there are no new claims to be added, it would stand that we owe about \$227,000, practically undisputed, on which we have to calculate interest for seven years at 4 or 6 per cent.; and when to the amount so found we add the half of the amount in dispute, it makes it, either at 4 or at 6 per cent., a larger sum than the sum agreed upon.

"If judgment is obtained against us, under what seems to me to be a rule we can not well escape, it will be, with interest, over \$750,000, for if we admitted through Mr. Blaine that it is a proper rule by which damages should be assessed, a rule that we then admitted, and, representing a great Government desiring to do justice and not to higggle upon small matters, I do not see now how we can raise that question over again. We admitted, through the Secretary of State and the President of the United States, that this was the rule when we had a chance to win. It will hardly be becoming in us, now that we have lost, to say that was not the proper rule; that 'it was a good rule when we thought we were going to win and you were to pay us money, but it is a bad rule when we have lost and we are to pay you the money.'

"This will be a humiliating position in which to put our Government, and for one I will not assume the responsibility of putting my country in such a position, nor will I be a party thereto. Let others do this if they so please, and to have such judgment made by arbitrators, and having arbitrators, will cost us not less than \$150,000, perhaps more, in addition. This Paris arbitration cost us \$224,000, and when we add the items together, the claims that are beyond doubt just against us, a fair compromise as to the part that is in dispute, the interest on the debts due, the expense of the arbitration, we shall get off by this payment by a very much smaller sum than in any other way. And, in addition to that, we settle at once a matter that is a sore.

"It seems to me that it is not a bad bargain. And upon broader grounds, when we come to settle what we owe, when the money is to go to persons who have been wronged by us—because, whatever the law may be in our judgment, we have submitted it to the arbitrament of this tribunal, and that question has been decided, that we have wronged these people—it does not become us to whine about it. It does not become us to go down to the tavern and denounce the judge, as litigants sometimes do who lose and have no appeal. Our duty and our pleasure ought to be in a spirit of international courtesy

and general fairness, having reached a conclusion that is not in itself a very bad one, to settle this matter and wipe it off the books and remove it as a matter of disagreement between Great Britain and this nation." That seems to me to be the best solution of the question."

Mr. Hill made this exposure of the character of the great mass of the claims:

"Mr. Chairman, the appropriation asked for here, of \$425,000 for damages to British subjects who were prevented from catching seals in Bering Sea, to be paid to Great Britain, and by that Government to be paid over to claimants, is in part for grossly exaggerated claims, in part for a mass of fiction, pure fiction of imaginary seal catches added to those exaggerated claims, and in part for outright frauds, pretended claims of British subjects, but really belonging to American citizens, who should be punished for violating their country's laws, not paid. That is in brief the nature of these claims. The whole amount of the claims added together is \$542,000. The President has proposed to pay \$425,000 to settle them in a lump sum, without examination. That would give every claimant four fifths of all his claim—a vast sum to pay for fictions and frauds! The men who were conducting these Bering Sea seal-fishing ventures, instead of being, as both gentlemen who have advocated this amendment have stated, 'engaged in a lawful occupation' were, in fact, as in more than half these claims, American citizens unlawfully engaged in transgressing an act of Congress which prohibited sealing in Bering Sea—a law absolutely binding upon them. We may be liable for actual damages to a British subject since the decision of the Paris tribunal of arbitration that we have no jurisdiction outside of the 3-mile limit, if we seize or warn him off from sealing there; but not so with Americans, for they are subject to our law, and we had a law forbidding sealing in those waters. Instead of being entitled to money they should have been arrested and fined. They are only entitled to punishment. They should go, not to the Treasury, but to jail.

"What are these claims? There were 18 ships that went to catch seals in Bering Sea, which it is agreed on both sides were seized or warned off by the United States cruisers. They are all claimed to have been owned by British subjects. Claims for two other ships have been added since, making 20 in all. As a matter of truth, 10 of these ships were owned by Americans. The real owners knew if they sent those ships into Bering Sea it was a violation of the laws of Congress, forbidding seal fishing there, and those laws were the laws of their country, from whose penalties they could not escape if known. So these owners put forward Canadians, British subjects, to conduct the work. How did they do it? Take one, the first one, Roscowitz. A man named Joseph Roscowitz, a rich man, an American citizen, as he stated to our consul, Myers, at Victoria and Mr. T. T. Williams in San Francisco, made a partnership with a Capt. Warren, a British subject, who was skilled in this business or craft, and lent him money to pay for his half of the vessels and ventures. So that Warren, who had no capital, was only nominally in-

terested as half owner. The loans were secured to Roscowitz by mortgages on the vessels.

"He lent Warren money at such a high rate of interest that it took all the profits, leaving Warren nothing for the work. Then Warren became insolvent, and Roscowitz closed down on him with his mortgages. But Roscowitz did not want the ships back in his own name. What then happened? They got a blacksmith named Thomas H. Cooper, a British subject living in San Francisco, a brother-in-law of Warren, to go up to Victoria, and when the sheriff sold off the whole fleet on the mortgage, this blacksmith bought it all in for \$1, and immediately executed mortgages on the ships at high figures to Roscowitz, and he has thus been the real owner. Roscowitz and Warren were there when this man Cooper bought the ships. The man did not even know the number or names of the ships when he gave his testimony.

"He testified that he did not pay the dollar, but told Warren to pay it for him; and he signed all the papers and mortgages presented to him by Roscowitz.

"Now, then, this man, Thomas H. Cooper, appears among the claimants as an injured British subject, demanding \$225,000 damages for the seizure of these ships which really belonged to Roscowitz. That is the way our Government is proposed to be plundered for a law-breaking American citizen. When you vote this and it is handed over to Sir Julian Pauncefote, whose action is purely ministerial and functional, is it to go, to the amount of four fifths of \$225,000, to Thomas H. Cooper, the British subject who served as the man of straw in this fraud, and who testifies that he has no interest whatever in it?"

The House refused, by a vote of 143 nays to 112 yeas, to include the item in the appropriation bill.

Copyright.—March 2 the House of Representatives suspended the rules and passed "a bill to amend section 4965, chapter 3, Title LX, of the Revised Statutes of the United States relating to copyrights":

Be it enacted, etc., That section 4965, chapter 3, Title LX, of the Revised Statutes be, and the same is hereby, amended so as to read as follows:

"Sec. 4965. If any person, after the recording of the title of any map, chart, dramatic or musical composition, print, cut, engraving, or photograph, or chromo, or the description of any painting, drawing, statue, statutory or model or design intended to be perfected and executed as a work of the fine arts, as provided by this act, shall, within the term limited, contrary to the provisions of this act and without the consent of the proprietor of the copyright first obtained in writing, signed in presence of two or more witnesses, engrave, carve, work, copy, print, publish, dramatize, translate, or import, either in whole or in part, or by varying the main design, with intent to evade the law, or, knowing the same to be so printed, published, dramatized, translated, or imported, shall sell or expose to sale any copy of such map or other article so infringing, he shall forfeit to the proprietor all the plates on which the same shall be copied, and every sheet thereof, either copied or printed, and shall further forfeit \$1 for every sheet of the same found in the possession, either printing, printed, copied, published, imported, or exposed for sale; and in case of a painting, statue, or chromo, he shall forfeit \$10 for every copy of the same in his possession, or by him sold or exposed for sale: *Provided, however,*

That in the case of any such infringement by a newspaper or news periodical the total sum to be recovered in any action brought under the provisions of this section shall not for any one infringement exceed double the market value of the copyright infringed upon. One half of all the foregoing penalties shall go to the proprietors of the copyright and the other half to the use of the United States."

"*Provided, however,* In the case of any such infringement of the copyright of a photograph made from any object not a work of fine arts, the sum to be recovered in any action brought under the provisions of this section shall be not less than \$100 nor more than \$5,000: *And provided further,* In case of any such infringement of the copyright of a painting, drawing, statue, engraving, etching, print, or model, or design not a work of fine arts, or of a photograph of the work of the fine arts, the sum to be recovered in any action brought through the provisions of this section shall not be less than \$250 and not more than \$10,000."

Mr. Covert, of New York, said in explanation of the measure:

"Mr. Speaker, the objects and purposes of this measure may be very concisely stated. It is intended to remedy a gross evil which has grown up under the existing statute, the provisions of which have brought about results which I am very sure were not contemplated when the copyright law was enacted some years ago. The chiefest injury inflicted in the enforcement of the statute as it stands has been and is suffered by the newspaper press of every section of the country. Under conditions as they exist to-day, if any newspaper shall, through oversight or otherwise, publish in its columns any copyrighted photograph, the newspaper may be made not only to forfeit the plates of such copy, but the sum of \$1 for every copy in its possession.

"And just here comes in the unanticipated wrong and injury inflicted upon the newspaper press under the existing law. I call attention to the phraseology of the statute establishing penalties for 'copies found in possession.' Without question the intention was to have this provision apply solely to lithographic prints and to other prints of that character where the issue or production was comparatively limited. The courts, however, have placed their own construction upon this provision of the statute. They have held that newspapers are liable to the penalty named, limited only in extent by the circulation reached by them; that is to say, that the phraseology, 'copies found in possession,' means the copies of the newspapers printed and circulated.

"I have no criticism to make, Mr. Speaker, upon this construction of the statute. I am inclined to believe that it is the only construction that can properly be given to it. But it is here that the wrong comes in, and it is the purpose of this measure to remedy the wrong by a modification of the extreme penalties established. I may add in this connection that the courts have further held that the penalties may be exacted even when the fact that the picture has been copyrighted does not appear on the original from which the copy is published.

"It can very readily be seen how, under conditions like these, it is more than hazardous for a newspaper to produce illustrations as a part of news articles concerning every-day events. It is the freshness, the early publication of illustrated news articles, which give them value and importance. It matters little how conscientious a

newspaper publisher may be, or how careful may be his methods in this regard. Time is the essence of the matter in his case. In the hurry of the preparation and publication of an illustrated news article violations of the existing statute may be made by the most careful and reputable of publishers. Penalties aggregating, under the construction of the statute I have mentioned, very much more than was contemplated when the present law was enacted may be sued for and recovered.

"Any number of instances may be cited in support of this statement. One of these instances may suffice as an illustration and an object lesson. One of the leading metropolitan journals, through an oversight on the part of one of its employees, printed a picture of a pleasure yacht from a copyrighted photograph, the regular price of which, including the license to print, was only \$1. Suit has been brought and is now pending to recover from the proprietors of the newspaper \$817,000, the penalties accruing upon the total number of the editions of the paper in which the picture appeared. Nothing need be added, it seems to me, to establish the existence of the wrong here sought to be corrected.

"The measure now before the House makes no change in the existing law except to moderate the rigor of its penalties. The purpose is not by any means to free infringers of copyright from substantial and proper penalties for their wrongful acts. It provides that in case of any infringement of the copyright of a photograph made from any object not a work of the fine arts, the sum to be recovered in any action shall be not less than \$100 nor more than \$5,000. In the case of a painting, statue, print, or design for a work of the fine arts, or an infringement of the copyright of a work of the fine arts, the penalty shall be not less than \$250 and not more than \$10,000.

"I beg to say, in conclusion, Mr. Speaker, that this measure has the strong indorsement of the American Publishers' Association, which earnestly asks its enactment. The American Copyright League and the Authors' Association join in the concession that the modification I have outlined should be made, and this amendment meets their entire approval.

"With the absolute assurance that this measure is in every way a conservative and proper modification of the existing statute, I earnestly ask that it may be enacted into law."

The Senate passed the measure on the same day and it was approved by the President.

Suppression of Lottery Traffic.—March 1, 1895, the House of Representatives suspended the rules and passed, with amendments, the Senate bill for the suppression of lottery traffic through national and interstate commerce and the postal service, subject to the jurisdiction and laws of the United States:

Be it enacted, etc., That any person who shall cause to be brought within the United States from abroad for the purpose of disposing of the same, or deposited in or carried by the mails of the United States, or carried from one State to another in the United States, any paper, certificate, or instrument purporting to be or representing a ticket, chance, share, or interest in or dependent upon the event of a lottery, so-called gift concert, or similar enterprise, offering prizes de-

pendent upon lot or chance, or shall cause any advertisement of such lottery, so-called gift concert, or similar enterprise, offering prizes dependent upon lot or chance, to be brought into the United States, or deposited to or carried by the mails of the United States, or transferred from one State to another in this sense, shall be punishable in the first offense by imprisonment for not more than two years or by a fine of not more than \$1,000, or both, and in the second and after offenses by such imprisonment only.

Sec. 3. That the provisions of sections 1028 and 1031 of the United States Revised Statutes as amended, respectively, and the provisions of sections 5191 and 5497 of the United States Revised Statutes, and of sections 11, 14, and 15 of the act of Congress of Oct. 3, 1890, entitled "chapter 1044. An Act to reduce the revenue and equalize duties on imports, and for other purposes," and all other provisions of law for the suppression of traffic in or circulation of any such tickets, chances, shares, or interests in or other matter relating to lotteries, or for the suppression of traffic in or circulation of chance bonds or articles of any kind, shall apply in support, aid, and furtherance of the enforcement of this act.

Sec. 5. That nothing herein contained shall be deemed to repeal by implication sections 1024, 1025, or 1041 of the United States Revised Statutes, or any part thereof, nor any provisions of the act of Congress of April 20, 1878, entitled "An Act to prevent the sale of policy or lottery tickets in the District of Columbia," nor any provisions of the act of Congress of Sept. 18, 1895, entitled "An Act to amend certain sections of the Revised Statutes relating to lotteries, and for other purposes," nor any provision of the laws whatsoever against the establishment of lotteries, or games, or other schemes, or prizes, or chances, or the traffic in or circulation of tickets and other such papers or instruments, or the publication of advertisements or notices in any wise relating thereto.

Sec. 6. That the powers conferred upon the Postmaster-General by the statute of 1890, chapter 308, section 2, are hereby extended and made applicable to all letters or other matter sent by mail.

The Senate, March 2, concurred in the House amendments, and the President approved the measure on the same day.

Registry Bonds.—Jan. 10, 1895, the House of Representatives passed the following Senate bill:

Be it enacted, etc. That section 4145 of the Revised Statutes, providing for bonds for registry of vessels, is hereby repealed.

Sec. 2. That section 4146 of the Revised Statutes is hereby amended so as to read:

"Sec. 4146. A certificate of registry shall be solely used for the vessel for which it is granted, and shall not be sold, lent, or otherwise disposed of, to any person whatsoever; and in case the vessel so registered shall be lost, or taken by an enemy, burned, or broken up, or shall be otherwise prevented from returning to the port to which she may belong, the certificate, if preserved, shall be delivered up within eight days after the arrival of the master or person having the charge or command of such vessel within any district of the United States, to the collector of such district; and if any foreigner, or any person for the use and benefit of such foreigner, shall purchase or otherwise become entitled to the whole, or any part or share of, or interest in such vessel, the same being within a district of the United States, the certificate shall, within seven days after such purchase, change, or transfer of property, be delivered up to the collector of the district; and if any such purchase, change, or transfer of property shall happen when such vessel shall be at any foreign port or place, or at sea, then the master or person having the charge or command thereof shall, within eight days after his arrival within any district of the United States, deliver up the certificate to the collector of such district. Any

master or owner violating the provisions of this section shall be liable to a penalty of not exceeding \$500, and the certificate of registry shall be therewith void. The Secretary of the Treasury shall have the power to remit or mitigate such penalty if in his opinion it was incurred without wilful negligence or intention of fraud."

Sec. 3. That section 4150, Revised Statutes, is hereby amended so as to read:

"Sec. 4150.—No licensed vessel shall be employed in any trade whereby the revenue laws of the United States shall be defrauded. The master of every such vessel shall swear that he is a citizen of the United States, and that such license shall not be used for any other vessel or any other employment than that for which it was specially granted, or in any trade or business whereby the revenue of the United States may be defrauded; and if such vessel be less than 20 tons burden, the husband or managing owner shall swear that she is wholly the property of citizens of the United States; whereupon it shall be the duty of the collector of the district comprehending the port wherein such vessel may belong to grant a license."

Sec. 4. That no land shall be required on the licensing of yachts; no licensed yacht shall engage in any trade, nor in any way violate the revenue laws of the United States; and every such yacht shall comply with the laws in all respects. Section 1 of the act approved March 3, 1893, amending section 4014, Revised Statutes, and so forth, is amended accordingly.

Sec. 5. That any master or owner violating the provisions of this or the preceding section shall be liable to the penalty of \$500, in addition to any other penalty imposed by law. The Secretary of the Treasury shall have power to remit or mitigate any such penalty if in his opinion it was incurred without negligence or intention of fraud.

Sec. 6. That this act shall not invalidate the bonds heretofore given under the requirements of law.

The measure was approved by the President Jan. 15.

Washington and Lee University.—On Dec. 6, 1894, the Senate passed the following measure for the relief of Washington and Lee University:

A bill (section 454) for the relief of Washington College (now known as Washington and Lee University), located at Lexington, Va.

Be it enacted, etc. That in order to reimburse to Washington College (now known as Washington and Lee University) for the injury to its buildings, apparatus, libraries, and other property injured or destroyed by troops of the United States during the late war, the Secretary of the Treasury is hereby authorized and directed to pay to the proper authorities of said institution, out of any money in the Treasury not otherwise appropriated, such sum, not exceeding \$17,494, as the accounting officers of the Treasury Department, under direction of the Secretary, may find to be duly proven as amount of such injury and destruction.

Sec. 2. That this act shall be in force from the passage.

March 2 the subject was brought up in the House of Representatives, and Mr. Tucker, of Virginia, moved to suspend the rule and pass the bill.

Mr. Powers, of Vermont, said in support of the motion:

"In my judgment this bill is legally, morally, patriotically, and constitutionally right. The President of the United States, Abraham Lincoln, in 1862 issued a proclamation for the guidance of the Union generals, in which he instructed them that institutions of learning, institutions devoted to charitable purposes, works of art, and all things of that sort should be spared from

spoliation by the invading army. In that proclamation he simply reiterated what the law of nations has always maintained, namely, that when hostilities are in progress all institutions of this character should be spared if possible.

"It is true that the exigencies of war may sometimes necessitate the occupation or the destruction of such institutions, but this is not that case. On Hunter's raid his men camped on the grounds of this university, and, under the license which sometimes prevails when soldiers are in camp, contrary to his orders some of his men entered these buildings and destroyed this property.

"Now, sir, it being a legal duty on the part of the Government to compensate such institutions for damages inflicted in this way, it being our legal duty by force of the proclamation of our own President, it being a moral duty on our part to repair, as well as we can, the injury that was done to this institution, it seems to me that we ought as well patriotically to vote this money unanimously. We have done it in the case of William and Mary College, which was a case less deserving than that of this institution.

"This institution was the pet of the Father of his Country. George Washington himself donated to it a fund now equal to the sum of \$50,000, the annual interest of which at 6 per cent. is paid by the State of Virginia to this institution. I hope, sir, there will not be a single vote or voice raised on this floor against this bill, for it is right and proper that we should pass it."

Mr. Reed, of Maine, said in criticism of the measure:

"I do not purpose, Mr. Speaker, to occupy the five minutes which have been given me by the gentleman from Missouri. My only purpose is to state what seems to me to be sound sense in connection with this matter, for from the indications which have already appeared it is evident that this question is to be considered upon sentiment and not upon reason and wisdom.

"The bill for the relief of the William and Mary College passed the last Congress. It was up many years ago. It was then carefully debated and carefully considered; and in a Democratic House the bill had been refused passage on account of its probable consequences. Without discussion, without examination, it was passed by the last Congress and was signed by the President. In my judgment, the passage of that act was a great mistake. In my judgment, also, it never would have passed if there had been that opportunity for discussion which a great question like that really demands, nor would this, even if there is involved in it a sentimental feeling which we might have toward a college bearing the name of the Father of his Country, even if there had been added to it the name of the general who commanded the rebel forces during the war. That sentimental feeling is very natural; but the principle involved, in my judgment, is something that we can not afford to sanction.

"War is a dreadful thing; it is barbarism, and, as a great general has said, can not be refined. But whoever provokes war must be prepared to take the consequences of war, and, among other consequences, even the lawlessness

of the troops who are engaged. And while there may be every effort to save institutions of learning, institutions of charity, libraries, and other things of that sort, nevertheless no nation can afford to adopt the doctrine that all injuries of that class are to be compensated when the war is over, because such injuries spread out in so broad a fashion that no nation ought to think of endeavoring to liquidate claims arising on that account.

"The passage of this bill will be a precedent in addition to that already established and which is now quoted, as I prophesied it would be if the bill passed. This is an additional precedent to be cited for granting compensation for every kind of injury that took place and a great deal of injury that did not take place during the Southern rebellion. We ought not to pass the bill. We ought not to establish the principle. Whenever war is made the consequences of the war must be taken. They are not subjects of recompense."

The rules were suspended, and the measure was passed and duly approved by the President.

Military Parks.—The Congress passed and the President approved two measures for military parks. One was for such a park at Shiloh, as follows:

Be it enacted, etc., That in order that the armies of the Southwest which served in the civil war, like their comrades of the Eastern armies at Gettysburg and those of the central West at Chickamauga, may have the history of one of their memorable battles preserved on the ground where they fought, the battlefield of Shiloh, in the State of Tennessee, is hereby declared to be a national military park, whenever title to the same shall have been acquired by the United States and jurisdiction over the lands and roads of the same shall have been granted to the United States by the State of Tennessee; that is to say, the area inclosed by the following lines, or so much thereof as the commissioners of the park may deem necessary, to wit: Beginning at low-water mark on the north bank of Snake creek where it empties into the Tennessee river; thence westwardly in a straight line to the point where the river road to Crumps Landing, Tenn., crosses Snake creek; thence along the channel or Snake creek to Owl creek; thence along the channel of Owl creek to the crossing of the road to Purdy, Tenn.; thence southwardly in a straight line to the intersection of an east and west line drawn from the point where the road to Hamburg, Tenn., crosses Lick creek, near the mouth of the latter; thence eastward along the said east and west line to the point where the Hamburg road crosses Lick creek; thence along the channel of Lick creek to the Tennessee river; thence along low-water mark of the Tennessee river to the point of beginning, containing 3,000 acres, more or less, and the area thus inclosed shall be known as the Shiloh National Military Park.

Sec. 2. That the establishment of the Shiloh National Military Park shall be carried forward under the control and direction of the Secretary of War, who, upon the passage of this act, shall proceed to acquire title to the same either under the act approved Aug. 1, 1888, entitled "An Act to authorize the condemnation of land for sites of public buildings, and for other purposes," or under the act approved Feb. 27, 1867, entitled "An Act to establish and protect national cemeteries," as he may select, and as title is procured to any portion of the lands and roads within the legal boundaries of the park he may proceed with the establishment of the park upon such portions as may thus be acquired.

Sec. 3. That the Secretary of War is hereby au-

thereafter to enter into agreements whereby he may lease, upon such terms as he may prescribe, with such present owners or tenants of the lands as may desire to remain upon it, to occupy and cultivate their present holdings upon condition that they will preserve the present buildings and roads and the present outlines of field and forest, and that they will not time or otherwise under such regulations as the Secretary may prescribe, and that they will assist in saving fire and protecting all tablets, monuments, or such other artificial works as may from time to time be ground by proper authority.

Sec. 4. That the affairs of the Shiloh National Military Park shall, subject to the supervision and direction of the Secretary of War, be in charge of three commissioners, to be appointed by the Secretary of War, each of whom shall have served at the time of the battle in one of the armies engaged therein, one of whom shall have served in the Army of the Tennessee, commanded by Gen. U. S. Grant, who shall be chairman of the commission; one in the Army of the Ohio, commanded by Gen. D. C. Buell; and one in the Army of the Mississippi, commanded by Gen. A. S. Johnston. The said commissioners shall have an office in the War Department building and while on patrol duty shall be paid such compensation out of the appropriations provided by this act as the Secretary of War shall deem reasonable and just; and for the purpose of assisting them in their duties and in ascertaining the lines of battle of all troops engaged and the history of their movements in the battle, the Secretary of War shall have authority to employ, at such compensation as he may deem reasonable, to be paid out of the appropriations made by this act, such persons recognized as well informed concerning the history of the several armies engaged at Shiloh, and who shall also act as secretary of the commission.

Sec. 5. That it shall be the duty of the commission named in the preceding section, under the direction of the Secretary of War, to open or repair such roads as may be necessary to the purposes of the park, and to ascertain and mark with historical tablets or otherwise, as the Secretary of War may determine, all lines of battle of the troops engaged in the battle of Shiloh and other historical points of interest pertaining to the battle within the park or its vicinity; and the said commission in establishing this military park shall also have authority, under the direction of the Secretary of War, to employ such labor and services and to obtain such supplies and material as may be necessary to the establishment of said park under such regulations as he may consider best for the interest of the Government, and the Secretary of War shall make and enforce all needed regulations for the care of the park.

Sec. 6. That it shall be lawful for any State that had troops engaged in the battle of Shiloh to enter upon the lands of the Shiloh National Military Park for the purpose of ascertaining and marking the lines of battle of its troops engaged therein: *Provided*, That before any such lines are permanently designated the position of the lines and the proposed methods of marking them by monuments, tablets, or otherwise shall be submitted to and approved by the Secretary of War, and all such lines, designs, and inscriptions for the same shall first receive the written approval of the Secretary, which approval shall be based upon formal written reports, which must be made to him in each case by the commissioners of the park.

Sec. 7. That if any person shall, except by permission of the Secretary of War, destroy, mutilate, deface, injure, or remove any monument, edifice, statue, memorial structure, or work of art that shall be erected or placed upon the grounds of the park by lawful authority, or shall destroy or remove any fence, railing, inclosure, or other work for the protection or ornament of said park, or any portion thereof, or shall destroy, cut, hack, bark, break down, or otherwise injure any tree, bush, or shrubbery that

may be growing upon said park, or shall cut down or fell or remove any timber, battle relic, tree or area growing or being upon said park, or fence within the limits of the park, or shall remove or destroy any fence, works, earthworks, walls, or other defenses or shelter or any part thereof constructed by the armies formerly engaged in the battle on the lands or appurtenances to the park, any person so offending and found guilty thereof, before any justice of the peace of the county in which the offense may be committed or any court of competent jurisdiction, shall for each and every such offense forfeit and pay a fine, in the discretion of the justice, according to the aggravation of the offense, of not less than \$5 nor more than \$50, one half for the use of the park and the other half to the informer, to be entered and recovered before such justice in like manner as debts of like nature are now by law recoverable in the several counties where the offense may be committed.

Sec. 8. That to enable the Secretary of War to begin to carry out the purpose of this act, including the condemnation or purchase of the necessary land, marking the boundaries of the park, opening or repairing necessary roads, restoring the field to its condition at the time of the battle, maps and surveys, and the pay and expenses of the commissioners and their assistant, the sum of \$150,000, or such portion thereof as may be necessary, is hereby appropriated, out of any moneys in the Treasury not otherwise appropriated, and disbursements under this act shall require the approval of the Secretary of War, and he shall make annual report of the same to Congress.

The other act was for the establishment of a military park at Gettysburg, as follows:

That the Secretary of War is hereby authorized to receive from the Gettysburg Battlefield Memorial Association, a corporation chartered by the State of Pennsylvania, a deed of conveyance to the United States of all the lands belonging to the said association, embracing about 800 acres, more or less, and being a considerable part of the battlefield of Gettysburg, together with all rights of way over avensons through said lands acquired by said association, and all improvements made by it in and upon the same. Upon the due execution and delivery to the Secretary of War of such deed of conveyance, the Secretary of War is authorized to pay to the said Battlefield Memorial Association the sum of \$50,000, or so much thereof as may be necessary to discharge the debts of said association, the amount of such debts to be verified by the officers thereof, and the sum of \$2,000 is hereby appropriated out of any money in the Treasury not otherwise appropriated to meet and defray such charges.

Sec. 2. That as soon as the lands aforesaid shall be conveyed to the United States the Secretary of War shall take possession of the same, and such other lands on the battlefield as the United States have acquired, or shall hereafter acquire, by purchase or condemnation proceedings; and the lands aforesaid shall be designated and known as the "Gettysburg National Park."

Sec. 3. That the Gettysburg National Park shall, subject to the supervision and direction of the Secretary of War, be in charge of the commissioners heretofore appointed by the Secretary of War for the location and acquisition of lands at Gettysburg, and their successors; the said commissioners shall have their office at Gettysburg, and while on duty shall be paid such compensation out of the appropriations provided in this act as the Secretary of War shall deem reasonable and just. And it shall be the duty of the said commissioners, under the direction of the Secretary of War, to superintend the opening of such additional roads as may be necessary for the purposes of the park and for the improvement of the avensons heretofore laid out therein, and to properly mark the boundaries of the said park, and to ascertain and distinctly mark the lines of battle of all troops engaged in the battle of Gettysburg, so far as the same shall fall within the limits of the park.

SEC. 4. That the Secretary of War is hereby authorized and directed to acquire, at such times and in such manner as he may deem best calculated to serve the public interest, such lands in the vicinity of Gettysburg, Pa., not exceeding in area the parcels shown on the map prepared by Major-Gen. Daniel E. Sickles, United States army, and now on file in the office of the Secretary of War, which were occupied by the infantry, cavalry, and artillery on the 1st, 2d, and 3d days of July, 1863, and such other adjacent lands as he may deem necessary to preserve the important topographical features of the battlefield: *Provided*, That nothing contained in this act shall be deemed and held to prejudice the rights acquired by any State or by any military organization to the ground on which its monuments or markers are placed, nor the right of way to the same.

SEC. 5. That for the purpose of acquiring the lands designated and described in the foregoing section not already acquired and owned by the United States, and such other adjacent land as may be deemed necessary by the Secretary of War for the preservation and marking of the lines of battle of the Union and Confederate armies at Gettysburg, the Secretary of War is authorized to employ the services of the commissioners heretofore appointed by him for the location, who shall proceed, in conformity with his instructions and subject in all things to his approval, to acquire such lands by purchase, or by condemnation proceedings, to be taken by the Attorney-General in behalf of the United States, in any cases in which it shall be ascertained that the same can not be purchased at prices deemed reasonable and just by the said commissioners and approved by the Secretary of War. And such condemnation proceedings may be taken pursuant to the act of Congress approved Aug. 1, 1888, regulating the condemnation of land for public uses, or the joint resolution authorizing the purchase or condemnation of land in the vicinity of Gettysburg, Pa., approved June 5, 1894.

SEC. 6. That it shall be the duty of the Secretary of War to establish and enforce proper regulations for the custody, preservation, and care of the monuments now erected or which may be hereafter erected within the limits of said national military park; and such rules shall provide for convenient access by visitors to all such monuments within the park, and the ground included therein, on such days and within such hours as may be designated and authorized by the Secretary of War.

SEC. 7. That if any person shall destroy, mutilate, deface, injure, or remove, except by permission of the Secretary of War, any column, statue, memorial structure, or work of art that shall be erected or placed upon the grounds of the park by lawful authority, or shall destroy or remove any fence, railing, inclosure, or other work for the protection or ornament of said park, or any portion thereof, or shall destroy, cut, hack, bark, break down, or otherwise injure any tree, bush, or shrubbery that may be growing upon said park, or shall cut down or fell or remove any timber, battle relic, tree or trees, growing or being upon said park, or hunt within the limits of the park, or shall remove or destroy any breastworks, earthworks, walls, or other defenses or shelter, or any part thereof, constructed by the armies formerly engaged in the battles on the land or approaches to the park, or shall violate any regulation made and published by the Secretary of War for the government of visitors within the limits of said park, any person so offending and found guilty thereof, before any justice of the peace of the county in which the offense may be committed, shall, for each and every such offense, forfeit and pay a fine, in the discretion of the justice, according to the aggravation of the offense, of not less than \$5 nor more than \$500, one half for the use of the park and the other half to the informer, to be enforced and recovered before such justice in like manner as debts of like nature are now by law recoverable in the county where the offense may be committed.

SEC. 8. That the Secretary of War is hereby authorized and directed to cause to be made a suitable bronze tablet, containing on it the address delivered by Abraham Lincoln, President of the United States, at Gettysburg, on the 19th day of November, 1863, on the occasion of the dedication of the national cemetery at that place, and such tablet having on it besides the address a medallion likeness of President Lincoln, shall be erected on the most suitable site within the limits of said park, which said address was in the following words, to wit:

"Four score and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal.

"Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great battlefield of that war. We have come to dedicate a portion of that field as a final resting-place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

"But, in a larger sense, we can not dedicate, we can not consecrate, we can not hallow this ground. The brave men, living and dead, who struggled here have consecrated it far above our power to add or detract. The world will little note, nor long remember, what we say here; but it can never forget what they did here. It is for us, the living, rather to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us; that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain; that this nation, under God, shall have a new birth of freedom, and that government of the people, by the people, for the people, shall not perish from the earth."

And the sum of \$5,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in the Treasury not otherwise appropriated, to pay the cost of said tablet and medallion and pedestal.

SEC. 9. That to enable the Secretary of War to carry out the purposes of this act, including the purchase or condemnation of the land described in sections 4 and 5 of this act, opening, improving, and repairing necessary roads and avenues, providing surveys and maps, suitably marking the boundaries of the park, and for the pay and expenses of the commissioners and their assistants, the sum of \$75,000, or so much thereof as may be necessary, is hereby appropriated out of any money in the Treasury not otherwise appropriated; and all disbursements made under this act shall require the approval of the Secretary of War, who shall make annual report of the same to Congress.

The Nicaragua Canal.—The bill "to amend the act entitled 'An Act to incorporate the Maritime Canal Company of Nicaragua,' approved Feb. 20, 1889," was a measure of the gravest importance; and though not taken up in the House of Representatives, it was the subject of earnest discussion in that body, where it finally passed. It involved the granting of aid by the United States Government to the project of a canal through Nicaragua, joining the Atlantic and Pacific. The bill as reported by Mr. Morgan, of Alabama, was as follows:

A bill to amend the act entitled "An Act to incorporate the Maritime Canal Company of Nicaragua," approved Feb. 20, 1889:

Be it enacted, etc., That the capital stock of the Maritime Canal Company of Nicaragua shall consist of 1,000,000 shares of \$100 each, and no more.

SEC. 2. That the words "the Nicaragua Canal,"

whenever used in this act, or the act in which this is an amendment, shall be held to include all real and personal property and franchises, railroads, piers, wharves, dams, locks, embankments, and other works necessary for or incidental to the construction, equipment, maintenance, and operation of the said inter-oceanic canal, made or that may be made by the Maritime Canal Company of Nicaragua, or under its authority, by virtue of this said act and the concessions granted or to be granted by Nicaragua and Costa Rica.

Sec. 3. That in consideration of the provisions of this act, and before any bonds are issued under the provisions thereof, all the stock of the Maritime Canal Company of Nicaragua heretofore subscribed for or issued, except as in this act provided, shall be called in, cancelled, and returned to the treasury of the company, so that none shall remain outstanding; all bonds issued by said company and obligations to deliver bonds shall be redeemed and cancelled; all outstanding liabilities of said company shall be satisfied, and all contracts and agreements heretofore made, but consistent with the provisions of this act, shall be cancelled, to the satisfaction of the Secretary of the Treasury, it being the intent and object of this act to secure the construction of the Nicaragua Canal by the said company, with the aid of the United States and under the general supervision of the Secretary of the Treasury, to the extent herein provided, upon the basis of the commitments of Nicaragua and Costa Rica now owned by said canal company, so far as practicable, at the actual cost.

Sec. 4. That to secure the means to construct and complete said canal, and to meet the expenditures made on account thereof, the said Maritime Canal Company of Nicaragua is hereby authorized to issue either coupon or registered bonds, or both, of the said company, in denominations of not less than \$50 nor more than \$1,000, to an amount not exceeding \$750,000, to be dated on the 1st day of January, 1904, to be payable on the 1st day of July, 1904, but redeemable at the pleasure of the United States at any time after the 1st day of July, 1904, with interest at the rate of 5 per cent. per annum, payable quarterly on the 1st day of April, July, October, and January of each year, from the delivery of the bonds to said company by the Secretary of the Treasury from time to time as in this act provided: *Provided*, That prior to the 1st day of July, 1907, no bonds so indebted shall be issued from the Treasury in excess of \$20,000,000, and on or before said date the President of the United States may at any time suspend the issue of said indebted bonds until Congress, being informed by him of the reasons for such suspension, shall otherwise direct.

And said bonds shall be secured by a first mortgage on its property and rights of property now existing or hereafter acquired of all kinds and descriptions, real, personal, and mixed; of all franchises and rights of the said company, including its rights and franchise to be a corporation. Such mortgage shall contain a provision for a sinking fund sufficient for the payment of said bonds at maturity. Such mortgage shall be as framed as to be valid as a first lien under the laws of Nicaragua and Costa Rica. The force and sufficiency of such mortgage as the first lien upon the Nicaragua Canal and of the provision for the sinking fund shall, before execution, be approved by the Attorney-General of the United States, and the trustees named in such mortgage shall be approved by the Secretary of the Treasury, and such mortgage shall be duly executed in triplicate by the officers of said company. And such mortgages shall be recorded in the office of the Secretary of the Treasury in Washington, and in the proper offices in Nicaragua and Costa Rica to be designated by the said States.

Sec. 5. That the said mortgage bonds shall be prepared, engraved, and printed at the Bureau of Engraving and Printing by the city of Washington at the expense of said Maritime Canal Company of Ni-

caragua, and, after being duly executed by the officers of said company, shall be deposited in the Treasury of the United States at Washington, and shall be issued by the Secretary of the Treasury from time to time to the said Maritime Canal Company of Nicaragua only as the work on the Nicaragua Canal progresses, as hereinafter provided.

Before the issue of said bonds by the Secretary of the Treasury he shall cause to be engraved and printed and duly executed on each of said bonds the guarantee of the United States, in accordance with such regulations as may be prescribed by the President of the United States, in the words and figures following, to wit:

"The United States of America guarantees to the lawful holder of this bond the payment by the Maritime Canal Company of Nicaragua of the principal of said bonds and the interest accruing thereon, and so thereon."

And no bonds shall be issued by the said company except as provided for in this act.

And the Secretary of the Treasury is hereby authorized and directed, if the interest on said bonds as it becomes due is not paid into the Treasury of the United States by the Maritime Canal Company of Nicaragua, to pay the same, and the sum required for that purpose is hereby appropriated, out of any money in the Treasury not otherwise appropriated. And all payments of principal of said bonds, or the interest thereon, shall be made through the Treasury of the United States.

The Maritime Canal Company of Nicaragua shall pay the interest on the guaranteed bonds heretofore provided for as it becomes due into the Treasury of the United States, and the guarantee of the United States shall not be held or construed as lessening the liability of said company as the principal obligor in said bonds. Upon the failure of said company to pay the interest as it becomes due on said bonds, and upon the payment of such interest by the United States, the said company shall be charged with and shall pay to the United States the amounts paid by the United States on such guarantee, with interest annually at 4 per cent., until paid.

Sec. 6. That for all sums that the United States may pay upon the principal or interest of said bonds under their said guarantee, the United States shall be subrogated to all the rights and liens under the said mortgage which the holders of said bonds or any of them would have had in respect thereof if the same had remained unpaid by the Maritime Canal Company of Nicaragua, and had not been paid by the United States under their guarantee; but until the expiration of five years after the said canal shall be put in operation, and so long as, during said five years, the canal shall be in operation and remain under the control of the Maritime Canal Company of Nicaragua, this subrogated lien and right of the United States as aforesaid shall not be satisfied by foreclosure or sale: *Provided*, That in case default shall be made by the said company at any time before the said canal shall be put into operation in the payment of interest as it becomes due, or if default shall be made in any other respect, the right of foreclosure and sale under said mortgage shall at once attach in favor of the United States, without the necessity of judicial proceedings, and may be exercised upon the written order of the President of the United States, given to the Attorney-General.

Sec. 7. That after the passage of this act, and before any bonds indebted under its provisions are issued, and after the surrender and return to the treasury of the company of all stock that may have been issued, and after the surrender and cancellation of all bonds, bond scrips, and obligations to issue bonds, the satisfaction of all liabilities of said company and the cancellation and extinguishment of all contracts and agreements of said company with individuals or corporations, except the concessions from Nicaragua and Costa Rica, but including its contract or agreement with the Nicaragua Canal Construction

Company for the construction of the said canal, as is provided for in this act, and after the acceptance of the provisions of this act by a resolution of the stockholders of said company at a meeting duly called and held for this purpose, a distribution and disposition of the capital stock of the said Maritime Canal Company of Nicaragua shall be made by the officers of the company, as follows, to wit:

First. Seventy million dollars of the capital stock of said company at the par value thereof shall be issued to the United States in consideration for its guarantee of the bonds of the company as provided in section 5 of this act, and the said stock so to be issued shall be full paid and nonassessable and shall be deposited in the Treasury of the United States.

Second. That \$6,000,000 of the said capital stock at the par value thereof shall be issued to the Government of the Republic of Nicaragua, and \$1,500,000 of the said stock at the par value thereof shall be issued to the Government of Costa Rica, according to the terms of their respective concessions heretofore made.

Third. The remaining stock of the company, to wit, \$22,500,000, at the par value thereof, shall be disposed of as hereinafter provided.

Sec. 8. That to enable the Maritime Canal Company to take up, cancel, and extinguish all issues of its stock heretofore made, except those made to the governments of Nicaragua and Costa Rica, and all outstanding obligations for stock, bonds, or bond scrip heretofore entered into by said company, the stock of said company, with the approval of the Secretary of the Treasury, shall be issued to the persons or corporations to be designated by said company not to exceed in the aggregate the sum of \$7,000,000 at its par value, which stock shall be nonassessable. The amount of stock so to be issued shall be finally determined by the Secretary of the Treasury, on principles of justice and equity, but shall not exceed \$7,000,000.

Sec. 9. That the proceeds of the remainder of the capital stock, if sold, be applied exclusively to the construction of the said canal, and the company may offer the said stock for subscription and sale at such time or times and at such price or prices as they shall, in their discretion, determine, but in no case shall the said stock or any part thereof be issued or sold except for cash, nor at any price less than its par value.

Sec. 10. That the working capital immediately available for continuing the construction of the canal may be derived from the proceeds of sale of the company's treasury stock, as provided in section 9 of this act, but should the company not be able to dispose of said stock at par within a reasonable time the Secretary of the Treasury shall, upon the application of the board of directors, deliver to the said Maritime Canal Company bonds of said company, guaranteed as aforesaid, amounting at the par value thereof to the sum of \$2,000,000, said bonds to bear interest from the date of the delivery; and the proceeds of said bonds, when sold by order of the company, shall be used as a working capital, and shall be applied exclusively to the construction of said canal and shall be accounted for by said company in the final settlement of its accounts for construction and deducted from the total amount of bonds which it may become entitled to receive under the provisions of this act.

Sec. 11. That the Secretary of the Treasury shall cause an account to be stated with the Maritime Canal Company of Nicaragua, as soon as practicable after the passage of this act, which shall include all necessary and proper expenditures made by said company since the 3d day of June, 1889, in and about the construction of the said canal, or incident thereto, including the railroad and telegraph lines built by said company. For the liquidation of the amount of such expenditures so ascertained, and by him approved, he shall deliver to said Maritime Canal Company the bonds of said company in an equal amount, but not to exceed \$4,500,000, with the guarantee of the United States thereon, as provided in section 5 of this act.

SEC. 12. That the President of the United States is hereby authorized and directed to cause careful and detailed estimates and statements to be made, from time to time, by duly appointed inspectors of his own selection, but not less often than quarterly each year, of the actual cost of all the work done, and of the plant, material, and services supplied on said canal, including reasonable costs of administration during each quarter, or since the last preceding estimate, and upon the filing with the Secretary of the Treasury of said estimate, duly certified by the inspectors, the said Secretary of the Treasury shall deliver to said Maritime Canal Company of Nicaragua the bonds of the said company, guaranteed as aforesaid, to the amount sufficient to pay such cost and also for the amount of the interest to become due upon its outstanding bonds before the next quarterly estimate; but the total amount of such bonds to be delivered shall not exceed the total cost of said canal and its equipment; and the proceeds of all said bonds shall be wholly applied in payment of the cost of the construction, equipment, maintenance, and operation of such canal and of the railroad, telegraph line, and vessels used in the construction thereof, or incidental thereto, and reasonable expenses of administration, and the accrued interest upon the outstanding bonds of the company, and such bonds shall not be sold or disposed of at less than par; and it shall be satisfactorily shown to the Secretary of the Treasury, before delivering any installment of bonds as aforesaid, that the proceeds of prior installments of bonds have been properly applied in the payment of the cost of construction and maintenance as aforesaid and interest on the bonds of the company. A sum or sums necessary to pay the expense of making the inspections and estimates provided for in this section is hereby appropriated, out of any money in the Treasury not otherwise appropriated, but all expenditures so made by the United States shall be refunded and repaid by the said company upon a final accounting.

Sec. 13. That to secure the proper application of the aid to be furnished by the United States by this act, and for the better and more economical execution of the powers conferred by this act and the act to which it is an amendment, section 4 of the act approved Feb. 20, 1889, entitled "An Act to incorporate the Maritime Canal Company of Nicaragua," be, and is, so amended that 10 of the 15 directors of said company shall be appointed by the President of the United States, by and with the advice and consent of the Senate, not more than 5 of whom shall be appointed from one political party; and 5 of whom shall hold office for one year and 5 for two years, as may be designated in their appointments, and their successors shall hold office for two years. And all parts of said act approved Feb. 20, 1889, inconsistent with this act are hereby repealed.

Sec. 14. That all the rights and powers reserved to Congress by section 8 of the act to which this is an amendment are hereby reserved, and shall apply also to this act.

Sec. 15. That in order to make certain of the feasibility, permanence, and cost of the said canal and its accessory works a board of 3 engineers is hereby constituted, the members of which may be selected by the President of the United States, 1 from the Corps of Engineers, United States army, 1 from the engineers of the navy, and 1 from civil life, and if the President, in his discretion, shall so direct, the said board of engineers, under the direction of the Secretary of State, shall visit and carefully inspect the route of the said canal, to examine and consider the plans, profiles, sections, prisms, and specifications for its various parts, and report thereupon to the President of the United States.

Sec. 16. That, for the purpose of paying the necessary expenses of the board of engineers created by section 15 of this act, if the President of the United States shall appoint them and call them into service, the sum of \$15,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in

the Treasury not otherwise appropriated: *Provided*, That the compensation of the members of said board of engineers from civil life shall be fixed by the President; and the Secretary of State, with the approval of the President of the United States, shall make all needful regulations for carrying this and section 14 of act into execution. And the Secretary of the Treasury, with the approval of the President, shall make all needful regulations for carrying into effect all other parts of this act and the act to which it is an amendment.

Mr. Morgan, after an elaborate discussion of the advantages of the Nicaragua Canal route, and the commercial development that would follow the building of the canal, said as to the policy of Government assistance:

"I hold that the national and international powers of the Government of the United States are equal, under our Constitution, to those of any power on earth. I am a Democrat of so strict a sect as to all that relates to the powers that Congress may exert over the States or against the people that I sometimes feel that I may be dropped from the Democratic procession as it moves in an aggressive course against our reserved rights. But I have always supposed that this vital doctrine of the Democratic creed was intended for the protection of the rights of the States and their citizens within the Union, and were not limitations upon the power of the United States to protect and defend the people and to promote their general welfare in our dealings and relations with foreign peoples and governments.

"As to these matters, I repeat, I would very much regret to be compelled to admit that the United States does not possess powers equal to those of any nation in the world.

"In the case of the United States Bank the Government owned a minority of the stock and the majority was owned by private citizens. This was, for this reason, a public corporation, although it engaged in the private business, even secret business, of dealing in exchange, discounting notes, and collecting money on commission.

"It was an instrumentality of Government and was exempt from taxation by the States. This canal is to have a majority of its stock in the ownership of the United States as an asset of the Treasury. It is to have a majority of its directors appointed by the President and confirmed by the Senate. Its business relates to the commerce and navigation of every nation of the earth. It is under the direct regulation of treaties with foreign powers. At its council board of directors the official representatives of three sovereign republics are assembled. In Nicaragua and Costa Rica the Maritime Canal Company has the right to the exclusive steam navigation of the San Juan river. It is the owner of a body of land more than 1,500 square miles in area in the state of Nicaragua. It has the power to levy tolls on the ships of all nations passing through the canal, exemption from local taxation on all its importations for canal purposes, with the right to make and enforce police regulations on and near the line of the canal and near all its works and appurtenances. With all these and other like powers, scarcely less than sovereign, there are still some who sternly persist in calling it a private corporation

and in inveighing against any partnership of the United States with private owners of the stock of such a corporation. The point is not well taken, because it is not true. Even if it were true, it would not be a worse form of interested concern in a private business than is the encouragement and protection given by acts of Congress to the manufacture of whisky in order that revenue may be gathered from its manufacture and its sale under Government license and regulation.

"The ownership of stock in this corporation is the sole method in sight, or in contemplation, by which the United States can exert an influence over the operations of this canal for the protection and benefit of the Government and people of the United States otherwise than by forcible or hostile intervention with the nations or the powers that will control it.

"I assume, upon the basis of experience, as well as that of unassailable logic, that it is necessary for the security of commerce, and, consequently, of the peace of the great maritime powers, that the Suez Canal and the Nicaraguan Canal should be under the care and protection of some great maritime nation. The Suez Canal is under such care from Great Britain, to which the acquisition of the island of Cyprus and the occupation of Egypt are auxiliary supports. The other powers will always see to it that the uses of the canal by neutrals shall be without unfair discrimination. The United States can neither have nor properly desire nor have need for any exclusive power over the international uses of this canal for commercial purposes.

"In time of war the occupation of these gateways of the oceans will be controlled by military forces, so far as the belligerents are concerned. No treaty can prevent that condition or provide against it in advance. In a war with Great Britain all treaty requirements as to the canal at Sault Ste. Marie and the Welland Canal would vanish at the sound of the first gun. But in times of peace the rights of nations are to be preserved in the Nicaraguan Canal by the power of the countries that own it. In this duty the United States will exert its authority with the firm and just impartiality that becomes its character as a great republic, having no entangling alliances with European or Asiatic powers.

"I also assume that this canal will be built only through the assistance of a subvention from some great nation.

"As an investment it is sufficiently attractive to draw the capital needed from private sources. But the canal is so thoroughly within the influence of international politics—diplomacy, in other words—that no private company and no weak power can give to investors the security of the advantage of permanent operations necessary to their prosperity. The obligation of the United States to protect this canal is not increased by the fact that it becomes a stockholder. We send troops to Panama to protect a railroad in which the United States has no property rights.

"It must therefore be built under the fostering support of some strong government. The Suez Canal, though much money was raised from private subscriptions to build it, was projected, conducted, and protected under the direct de-

crees of the Khedive of Egypt, confirmed by the firman of his suzerain, the Sultan of Turkey.

"The original stock subscription was 397,438 shares of 500 francs each. Of this sum the Khedive of Egypt took 176,602 shares, nearly half the entire stock, and gave the right to the company to demand from the Government the labor of the fellahin, or native laborers, at the rate of 1½ to 2 francs per day, with a ration of 1 piaster a day, or 4½ cents in rice, sorgo, dates, and onions. At one time more than 25,000 of these people were at work on the canal.

"The British Government afterward, in November, 1875, bought the shares of the Government of Egypt for £3,976,582, and now has the financial and military control of the entire canal. This canal was built under concessions to De Lesseps and a company he was authorized to form under a decree of the Khedive, similar to that formed under the laws of the United States by the Maritime Canal Company, but not nearly so well guarded nor so just. The Khedive, in the first concession, retained the power to name the director of the company, in the Egyptian Government, chosen as far as possible from those most interested in the undertaking, and he also reserved to the Egyptian Government, yearly, 15 per cent. of the net profits shown in the balance sheet of the company.

"This concession also provided that on the expiration of the concession at the end of ninety-nine years the Government (not the Khedive) was to succeed to the company, enjoy all its rights, and enter into full possession of the canal. The same provision is in the concessions of Nicaragua and Costa Rica, with the option to the canal company to extend the period to another term of ninety-nine years.

"The Egyptian concession also provided that no alterations could be made in the statutes of the company (its by-laws and regulations) without receiving the previous approbation of the viceroy.

"The Suez Canal being entirely within Egyptian territory, it is difficult to conceive of a case of more complete governmental control than was in that case exercised over the canal in all its stages by the Government of Egypt. These facts correct the assertion, sometimes made, that governmental control over such enterprises is not necessary, and has not been exercised in the case of the Suez Canal.

"If the Nicaraguan Canal were built independently of the United States, with private capital alone, the only legal power left to us to control the conduct of the company is the power reserved to amend or repeal the charter. The concessions made by Nicaragua and Costa Rica belong to the Maritime Canal Company, and are not amenable to the power of the United States until the consent of the owner is given. That company can sell these rights to whom they please, except to some government, and the repeal of the charter would only dissociate the United States from all control of the canal, and force the owners to go elsewhere for the corporate authority contemplated in the concessions, which they can now freely do, without any lawful power in Congress to prevent them.

"It is evidently true that unless this canal is built with the aid of a subvention from the

United States we must abandon the hope of opening this water way until we are prepared to acquire from Nicaragua and Costa Rica such dominion in their territories as we refused under the Frelinghuysen-Zavala treaty, for the reason, as I believe, that the Senate was apprehensive that such a footing in Nicaragua as we acquired by that treaty was violative of the provisions of the Clayton-Bulwer treaty.

"So the future is hedged in, the past is irrevocable, and we must act now or abandon the canal to its fate.

"To abandon this canal now, when the door to its success stands so invitingly open, is a responsibility that I am unwilling to assume, and is a dereliction that I fear our people will not forgive. The present situation, that separates our coasts on the Pacific and Atlantic Oceans by 15,000 miles of dangerous navigation, which can be overcome or lessened by two thirds by the investment, at a profit and without danger of loss, of \$70,000,000 of our credit, will become a lasting discredit to this generation if we do not at least attempt to alter it.

"The shortening of our coastwise line of traffic between the Atlantic and Pacific States would alone demand the expenditure of such a sum without the hope or expectation of other advantage to come from it. We have taught the Oriental nations the use of naval power in great steamships of war, and so formidable are they upon the ocean that it becomes us to duplicate our navy in the Pacific Ocean. The trade of that ocean is eagerly sought after by all the great maritime powers, and the completion of the Siberian Railroad, now well advanced by Russia, will make our interests in the West as important as they are in the Eastern waters. We already have more need of fleets in the Pacific than in the Atlantic Ocean. With this canal we could move our ships of war upon short lines with abundant fuel, and concentrate a fleet in three weeks upon our western coast that we could not assemble in three months by doubling Cape Horn.

"In case of war with any transoceanic power we could certainly occupy the canal or the adjacent waters sooner than they could. Our proximity to and interest in the canal would give to us a moral power in this hemisphere that would keep the peace in all America against domestic turbulence and foreign assault. Our just influence in the commerce of the Western Hemisphere would then speedily ripen into richer harvests of profitable trade than all that we now enjoy. New York would then become the commercial clearing house and mart of exchange at least for American merchants, if it did not find that in its march to the west the empire of commerce would establish its throne in that metropolis.

"Here this great subject widens until it seems to comprehend the advancement of every American interest, and to arouse the proud hopes of every American citizen. The general welfare of all America will be advanced with a mighty progress by this canal. With one accord, in every quarter they raise their hands in imploration to Congress, and with united acclaim they demand that we shall work while it is yet day for this great national blessing.

"This subject is so national and so international in its character that it has never been dwarfed to the character of a mere party question. The national conventions of both the great political parties of the country since 1856, and our Presidents and great statesmen long before that time, have been anxious for this work to begin. As our territory has expanded to the westward, it has become the earnest desire of every patriot and impartial American. The first report upon it, made to the Senate, was unanimous, and the Senators who made it were from Maine, Vermont, Oregon, Louisiana, Alabama, Georgia, New York, and two from Ohio of different political parties. That bill was far less restricted than the bill now before the Senate. Further consideration and stronger pressure upon the owners of the concessions to meet objections that have been urged against the measure as being a means of enriching the promoters of the canal have induced their harsher treatment.

"I will state again that this measure had its origin in no request of the owners of these concessions for Government aid, or for any form of legislation. It originated with a resolution of the Senate, which was addressed to the inquiry whether the canal was being built by the Maritime Canal Company at a cost that would necessitate too heavy a burden, in canal tolls, upon the industries and commerce of the country. The inquiry developed the fact that this apprehension was true; but that it resulted from the fact that no set of individuals could obtain from capitalists so great a sum of money on the credit of the canal company and its property without heavy rates of interest and large issues of bonds, backed by large issues of its stock. All this was the usual course of business in enterprises of such magnitude. No such work could be done without such sacrifices. There was not, and could not be, any dishonesty or reckless speculation in the matter.

"It was obvious to all that the power of Congress to amend or repeal the charter, if exercised in hostility to the Maritime Canal Company, would wreck the company, destroy the enterprise, force the forfeiture of the concessions, and lose to our citizens as much as \$4,000,000 actually expended, besides great personal risks they had incurred on account of the canal and a vast amount of labor performed by many of our first citizens. It was equally obvious that our intervention in the matter would seriously affect the credit and prospects of our own people in this great work unless Congress should agree to substitute the credit of the United States for that of the company and give to the Government the powers of a holder of a majority of the stock and a majority of the directors in the corporation.

"This plan could not be carried out until the company should cancel every outstanding contract and obligation connected with the canal except the concessions.

"This precedent necessarily created a difficulty that the Maritime Canal Company found it hard to meet. But they undertook to make provision for it in a way that is highly creditable to their patriotism and in keeping with an honorable ambition to accomplish this grand work, in which our whole people have a just

pride and the hope of great national growth in power."

Mr. Turpie, of Indiana, led in opposition, and took up the various probabilities as to the engineering and commercial success of the enterprise; as to the policy and right of Government aid, he said:

"Mr. President, I am heartily in favor of the construction of a Nicaraguan canal, or of any other navigable highway which shall traverse the American Isthmus. I do not think there is a member of any legislative assembly in Christendom who will declare his opposition to that enterprise. The execution of such a design has been for centuries the desire of all nations—long wished for, earnestly expected. An aspiration so deeply founded in the heart of mankind has only been matched by the difficulty of its accomplishment. The successful completion of such a work would rival, it would outvie the magnificent achievement of De Looze in Egypt.

"The Suez Canal joins only two seas. A very long and sometimes tempestuous voyage through the Straits of Gibraltar to the Straits of Bab-el-Mandeb is a part of the canal journey. The American canal would unite two oceans which girdle vast spaces in the surface of our planet with their mighty floods. There is a certain grandeur even in the conception of a design so stupendous. It appeals as strongly to the imagination as it does to the judgment of mankind. We may fancy we see the revisiting shade of Columbus standing upon some lofty peak of Darien, looking with calm, earnest eyes upon the shining stream flowing in unbroken course from shore to shore, and exclaiming: 'This, at last, is the way to the Indies, to the pearl-bearing Orient, to the El Dorado of far Cathay!'

"Mr. President, enterprises of such great path and moment require for their execution means, but I do not refer now in this part of the argument to funds or money. They require ways and means and methods of prosecution and of progress—ways in which the intention and purposes of promoters may find a legalized force, embracing concessions, treaties, legislation, acts of Congress.

"I do not regard the pending bill as furnishing any means for the accomplishment of this enterprise; I do not regard it as tending to promote the prosecution to completion of the Isthmian canal. I regard it, whether designed or undesigned, as one of those measures which will assuredly lead to another failure—I think the fifty-first failure—of concessions granted for the building of this canal.

"One of the objections to this form and method—it is only an objection to the scheme of the bill—is that I entertain very great doubts, very grave doubts, with respect to its constitutionality. It is a very childish, puerile, trivial question to ask, 'Is there anything in the Constitution which forbids this?' The proposition in the bill is that the United States shall induce and guarantee the payment of the principal and interest of certain bonds of a corporation, and it is asked, 'Is there anything in the Constitution of the United States forbidding this?' There is not, sir. But I think the material question should be, Is there anything in the Constitution

of the United States allowing this, or permitting it, or authorizing it?

"No; there is no inhibition in the Constitution of the United States against such a measure as this. There is no inhibition in the Constitution of the United States against the Government indorsement and guarantee of the note of any individual—Mr. Warner Miller or Mr. Menocal. There is just as much authority in the Constitution of the United States to indorse and guarantee an individual note as there is to indorse and guarantee the bonds or notes of any corporation. I do not think there is any power granted in the Constitution, and therefore I do not think there is any authority in Congress, to indorse and guarantee the paper of a corporation, public or private, or of any individual, either in his official or personal capacity. I am certain there is not. There is not any provision even looking to that or contemplating such an indorsement and such a guarantee; and yet, as I have often said, and as I heard a Senator upon the other side of the Chamber say this afternoon this is a Government of limited powers. The silence of the Constitution are as obligatory as its utterances, whether of grant or inhibition, and when the Constitution does neither permit nor allow, nor deny nor disclaim powers such as are named in this bill, when it is altogether silent with respect to such powers, they do not exist. Powers not granted expressly and not necessarily implied have no existence.

"May the Government, then, for any purpose indorse and guarantee the bonds or notes of a corporation? If it may, the Government may then indorse and guarantee the bonds of any State. There would be a great deal less risk, to say the least of it, in indorsing the bonds of any State of this Union than in indorsing those of a private corporation, such as the one named in this bill. How would you institute a comparison between the credit and resources of the great State of New York, of Massachusetts, and of others I might name, and the credit and resources of this corporation, confessedly bankrupt and now in the hands of a receiver?

"Are we looking for investment? I do not know of an instance in which any State in the Union has come to the Government—I know my State did not—and asked what this corporation does, that the United States will indorse and guarantee the payment of its paper. I know the State of Indiana suspended payment once, then resumed, then suspended, then paid again, and continues to the present day in a state of solvency. That large indebtedness was made for the building of a canal, and the State's paper was dishonored for a long time and its credit suspended, but we never thought of coming to Washington to secure a guarantee.

"The learned and honorable Senator from Alabama said the other day that the United States had all the national and international powers of any other nation on the earth. I have no doubt of that. She has all, and no more; she has no greater than Switzerland, no greater than the Republic of Monaco; but what has national and international power to do with this indorsement and guarantee of the Niagara Maritime Canal Company's bonds? They have no relation whatever to foreign affairs. It is a most ordinary business transaction; it is just like

this: A merchant in New York, having failed, being embarrassed and in doubtful circumstances, wishing to establish a line of credit in another and new enterprise, gets a merchant in Washington, of full resources and of full credit, to indorse his paper and guarantee the payment of it. It is a plain commercial transaction, and has nothing to do with foreign relations, and nothing to do with national or international powers.

"This bill proposes to make \$70,000,000 of commercial paper, bonds issued by the company named in it, and these are to be indorsed by the Government of the United States and guaranteed by that Government."

The bill was amended in a few trifling details and on Jan. 25, 1895, the Senate passed it by the following vote:

YEAS—Aldrich, Allison, Burrows, Butler, Cameron, Chandler, Cullom, Faulkner, Frye, Gallinger, Gibson, Gorman, Hale, Hoar, Hutton, Lodge, McMillan, Manderson, Mitchell of Oregon, Morgan, Murphy, Platt, Power, Pritchard, Proctor, Pugh, Ransom, Squire, Walsh, White, Wilson—81.

NAYS—Allen, Blackburn, Blanchard, Caffery, Call, Cockrell, Daniel, Davis, George, Gray, Hill, Irby, Jones of Arkansas, Kyle, Mills, Palmer, Peffer, Pettigrew, Turpie, Vilas, Wolcott—21.

NOT VOTING—Bate, Berry, Brice, Camden, Carey, Coke, Dixon, Dolph, Dubois, Gordon, Hansbrough, Harris, Hawley, Higgins, Jones of Nevada, Lindsay, McLaurin, McPherson, Martin, Mitchell of Wisconsin, Morrill, Puseo, Perkins, Quay, Rosch, Sherman, Shoup, Smith, Stewart, Teller, Vest, Voorhees, Washburn—33.

The measure was reported to the House of Representatives by the appropriate committee, but never got beyond that point of progress.

The Senate, however, inserted in the sundry civil appropriation bill a grant of \$20,000 for the expenses of a Government commission to examine the canal route and report to the President. The commission was duly appointed after the adjournment of Congress, one member representing the army, another the navy, and a third the American Society of Civil Engineers.

Miscellaneous.—The following measures were passed:

To extend the jurisdiction of justices of the peace in the District of Columbia and to regulate proceedings before them.

For the relief of sufferers by the wreck of the United States steamer "Tallapoosa."

Providing for an additional circuit judge in the Ninth Judicial District.

To authorize the appointment of women as school trustees in the District of Columbia.

To provide that all persons employing female help in stores, shops, offices, and manufactories in the District of Columbia shall furnish seats for the same when not actually employed.

For referring outstanding claims against the District of Columbia to the Court of Claims.

In reference to a free zone along the northern frontier of Mexico and adjacent to the United States.

To authorize the Secretary of the Navy to certify for restoration to the public domain lands in Alabama and Mississippi not needed for naval purposes.

To regulate navigation on the Great Lakes and their connecting and tributary waters.

To authorize the appointment of cadets to the Naval Academy.

To provide special rules for the navigation of rivers, harbors, the Great Lakes, and inland waters of the United States, supplementary and amendatory to the act of Aug. 19, 1890, entitled "An Act to adopt regulations for preventing collisions at sea."

To provide for the measurement of vessels.
To amend further section 2 of the act for the relief of certain volunteer and regular soldiers of the late war and the war with Mexico passed March 3, 1865.

To permit the use of the right of way through the public lands for roads, canals and reservoirs, and for other purposes.

To provide for the examination and classification of certain mineral lands in Montana and Idaho.

To disapprove the treaty heretofore made with the Southern Ute Indians to be removed to the Territory of Utah, and providing for settling them down in severalty where they may so elect and are qualified, and to settle all those not electing to take lands in severalty on the west 40 miles of present reservation and in portions of New Mexico, and for other purposes.

To amend section 6 of the act entitled "An Act to regulate the laws of judgments and decrees of the courts of the United States," approved Aug. 1, 1868.

To amend the articles for the government of the navy relative to punishment on conviction by court-martial.

To repeal an act entitled "An Act to amend the laws relative to shipping commissioners," approved Aug. 15, 1866.

To amend the articles for the government of the navy.

To amend the act entitled "An Act to establish circuit courts of appeals and to define and regulate in certain cases the jurisdiction of the courts of the United States, and for other purposes," approved March 3, 1881.

For the promotion of anatomical sciences, and to prevent the desecration of graves in the District of Columbia.

To amend "An Act to amend section 4400 of Title LII of the Revised Statutes of the United States, concerning the regulation of steam vessels," approved Aug. 7, 1882; and also to amend section 4414, Title LII, of the Revised Statutes, "Regulation of steam vessels."

To protect public forest reservations.

To revive the grade of lieutenant general in the United States army—a measure for the appointment of Gen. Schofield.

For the encouragement of education in Mississippi.

Appropriations.—The following table gives the appropriations of the Fifty-third Congress, the total for each session, and the total for all sessions:

TITLE.	FIFTY-THIRD CONGRESS.	
	Extra and first regu- lar sessions, 1893.	Third session, 1894.
Agriculture.....	\$3,334,028 04	\$3,301,750 00
Army.....	28,592,881 69	28,552,606 00
Artisan and consular.....	1,566,914 74	1,575,073 94
District of Columbia.....	2,545,678 57	2,745,646 35
Education.....	2,427,004 00	1,904,567 50
Indian.....	10,655,545 16	8,978,948 01

Total for the Congress.....	\$989,380,091 04	

CONGRESS OF FREE CHURCHES. The third National (English) Congress of Evangelical Free Churches met in Birmingham, March 25. About 500 delegates were present, representing about 5,000 churches. The congress was constituted under the presidency of the Rev. Dr. Berry, Congregationalist, who made an address in which he related the origin and described the programme and the hopes and aims of the body, which was described as a federation of evangelical free churches. The aims of the body were defined as being the exaltation of Christ, the promotion of the New Testament doctrine of the Church, and the liberation of religion from the blighting control of priestcraft and of the Churches from the government of Parliament. A report respecting federations and councils in connection with the congress stated that

when the resolution intrusting the committee to promote the establishment of councils was passed a year previously, providing that the conference should consist of representatives of such councils, there were not more than a dozen councils or federations in existence. Now there were nearly 140 councils in towns alone, large and small, touching every part of England. But while it was necessary to realize that this is an age of large towns, the federation movement contemplates the rural districts also. The villagers were awaiting their initiative to devise some method of practical union that should enable them to hold their own against the adverse influence of sacerdotalism and territorialism. Among the practical results of the councils was the home-to-home visitation at Halifax and Birmingham, though Bradford led the way, and untold missions had also been promoted. The councils had led crusades against gambling, drink licenses, etc.; they had materially influenced school-board and municipal elections; they had done much to dissipate local ignorance of nonconformist principles and history and to expose the Romanizing tendencies of the Anglican Church. Some councils had become consultative bodies, to which plans of new churches and missions were submitted, and thus the waste of force in overlapping was prevented.

A session of the conference was given to the discussion of the suffering of the Armenians, which were described by a representative of that nationality, after which a resolution was adopted expressing indignation that Turkey had so terribly violated the engagement of the Congress of Berlin, urging the Government to take such steps as are needful to secure protection for the Christians of Armenia, and expressing the conviction that reports of consular authorities in Armenia should be published for the information of the nation. A resolution on the subject of public elementary instruction in England and Wales affirmed

1. That in justice to the parents there should be provided within reasonable distance of every family a school conducted under the management of a school board; and

2. That in order to secure equitable use of public money, effective control on the part of electors ought to accompany all grants made to schools, whether from taxes or rates, we declare our judgment that, in any amendment of the Public Elementary Schools act, there are the two guiding principles which should determine legislation.

The subjects of "Disestablishment," "Modern Biblical Scholarship in its bearing on Christian Thought and Faith," and "Woman's Power of

Service in the Church" were discussed. A resolution was adopted expressing concurrence with the general proposals of the Welsh Disestablishment bill. Another resolution called attention to the fact that the slave trade still exists in Africa, and sought to impress on the Churches the necessity of interesting themselves in that question. Favorable reports were given of the operations and success in various places of the Pleasant Sunday Afternoon system for men. At Great George Street Chapel, Liverpool, with a weekly attendance of 1,500 members, it had a benevolent fund, ambulance classes, and systematic visitation of sick members. At Leeds the people liked the service because it was short, sharp, and attractive. Resolutions were unanimously adopted in favor of local option and urging legislation to restrict or prohibit the sale of liquor and in favor of international arbitration.

CONNECTICUT, a New England State, one of the original thirteen; ratified the national Constitution Jan. 9, 1788; area, 4,990 square miles. The population, according to each decennial census, was 237,946 in 1790; 251,002 in 1800; 261,942 in 1810; 275,148 in 1820; 297,675 in 1830; 309,978 in 1840; 370,792 in 1850; 460,147 in 1860; 537,454 in 1870; 622,700 in 1880; and 746,258 in 1890. Capital, Hartford.

Government.—The following were the State officers during the year: Governor, O. Vincent Coffin, Republican; Lieutenant Governor, Lorin A. Cook; Secretary of State, William C. Mowry; Treasurer, George W. Hodge; Comptroller, Benjamin P. Mead; Adjutant General, Charles P. Graham; Quartermaster General, William E. Disbrow; State Librarian, Charles J. Hoadley; Commissioner of School Fund, Jeremiah Olney, succeeded July 1 by Herbert E. Benton; Insurance Commissioner, Burton Mansfield, succeeded July 1 by Frederick A. Betts; Railroad Commissioners, William O. Seymour, reappointed, George M. Woodruff, and Alexander C. Robertson; Bank Commissioners, Edwin A. Buck, succeeded July 1 by Sidney W. Crofut, and Edward R. Doyle; Fish Commissioners, James A. Bill, Samuel M. Bronson, and Richard E. Follett; Shellfish Commissioners, George C. Waldo, reappointed, Charles W. Beardsley, succeeded July 1 by George W. Hallock, and Christian Schwartz; Commissioner of Bureau of Labor Statistics, Robert J. Vance, succeeded July 1 by Samuel B. Horne; Dairy Commissioner, Comfort S. Burlingame; Commissioners of newly created Board of Mediation and Arbitration, Dwight Loomis, George C. Parsons, and Prof. Arthur T. Hadley; Commissioners of new Board of Highways, James H. McDonald, A. C. Sternberg, and W. R. McDonald; Trustees of newly authorized State Reformatory, Walter Hubbard, George W. Swan, Edward M. Chapin, Prof. John J. McCook, and Frederick A. Spencer; President of State Board of Charities, Dr. A. W. Tracy, Secretary, Miss Mary Hall, Visiting Agent, Rebecca G. Bacon; Secretary of State Board of Education, Charles D. Hine; Inspector of Factories, E. Burrows Brown, succeeded July 1 by George L. McLean; Chief Justice of the Supreme Court of Errors, Charles B. Andrews; Associate Justices, David Torrance, Augustus H. Fenn, Simeon E. Baldwin, and William Hamersley.

Finances.—The latest report of the Treasurer, which covers the fiscal year ending Sept. 30, 1894, presents the following figures: Balance to credit of all accounts on Oct. 1, 1893, \$982,091.36; total receipts from all sources during the year, \$2,292,859.62; total disbursements, \$2,339,517.67; balance to credit of all accounts on Oct. 1, 1894, \$935,433.31. The principal receipts were derived from the following sources: Tax on railroads, \$766,420.76; tax on savings banks, \$309,792.16; tax on mutual insurance companies, \$262,452.85; military commutation tax, \$137,223; tax on nonresident stock, \$91,182.12; collateral inheritance tax, \$74,179.07; Commissioner of Insurance, \$62,115.82; tax on investments, \$56,003.88; interest, \$37,469.92; avails of courts and bonds, \$31,822.85; national aid to State homes, \$21,600; Commissioners of Railroads, \$19,860.20; tax on telegraph and telephone companies, \$10,910.83; and tax on express companies, \$9,839.39. The disbursements were divided as follows: Civil-list orders, \$1,564,194.22; registered orders, \$354,902.08; interest on State bonds, \$104,700; and other interest items, \$2,325.89. The funded debt of the State, Sept. 30, 1894, was \$3,240,200; less cash in the treasury to credit of civil-list funds, \$738,418.07; net debt, \$2,501,781.93.

According to the last report of the Comptroller, the total assessed valuation of property in the State on Oct. 1, 1893, was \$416,323,645, an increase in a year of \$35,061,183. The valuation by counties was as follows: New Haven, \$106,429,424; Fairfield, \$101,715,966; Hartford, \$96,716,342; New London, \$37,965,234; Litchfield, \$28,081,896; Middlesex, \$18,901,751; Windham, \$17,993,764; and Tolland, \$8,518,875.

Education.—An interesting feature of the report of the State Board of Education, submitted Jan. 23, 1895, is a brief history of each of the free town libraries, with illustrations of most of them and the acts relating to libraries passed during the session of the Legislature of 1893. The report for the school year ending July 14, 1894, shows: Children of school age (four to sixteen years) in the State, 169,457; enrolled in public schools, 136,049; number in average daily attendance, 91,471; average school year, 182.92 days; number of schoolhouses, 1,622; value of all public-school property, \$8,042,411.12; male teachers—in winter 405, in summer 332; female teachers—in winter 3,093, in summer, 3,163; total in winter, 3,498, in summer, 3,495; average monthly wages—male teachers \$85.87, female teachers \$41.48; number of school districts, 1,347; public schools, 1,561; graded schools, 385; high schools, 36; evening schools, 45; normal schools, 3. The sources of public-school revenue were: Permanent funds, \$168,302.04; State taxes, \$254,185.50; local taxes, \$1,713,649.32; and other sources, \$373,592.05; total, \$2,509,728.91. The expenditures were: For new buildings, \$464,107.01; libraries and apparatus, \$18,824.55; running expenses, including salaries of teachers and superintendents, \$1,778,950.79; and other expenses, \$380,745.35; total, \$2,642,627.70. The returns of the school visitors showed that there were 20,981 children registered in private schools in 1894, and 21,460 in 1895.

The permanent invested funds of all kinds on Sept. 30, 1894, aggregated \$3,054,541.34, and the

principal of the school fund proper comprised bonds and mortgages, \$1,701,389.56; real estate, \$110,044.15; bank stock, \$167,147.61; and cash, \$30,186.96; total, \$2,011,768.28. The Comptroller of the school fund reported that present investments of his department were sound. Gov. Coffin, in his message to the General Assembly in January, 1895, alluding to losses on real estate taken by foreclosure, expressed the opinion that the school fund would continue to lose to some extent as long as the State loaned its money.

Banks.—The United States Comptroller of the Currency reports the number of national banks in Connecticut, on Oct. 2, 1894, as 83, which had loans and discounts aggregating \$45,782,423. According to the last report of the State Bank Commissioners there were on Oct. 1, 1894, 8 State banks, with combined capital of \$2,340,000; surplus and profits, \$777,385.02; deposits, \$4,494,455.12; and total liabilities, \$8,176,837.72. The assets included loans and discounts, \$4,693,180.66; stocks, bonds, and mortgages, \$1,577,417.86; and amount due from banks and bankers, \$1,104,105.53. There were 91 savings banks, with 347,327 depositors, and \$136,930,350.91 in deposits. During the year 47,404 new accounts were opened, and 45,928 old ones closed; new deposits and interest credited aggregated \$31,451,196.47, and withdrawals \$28,527,175.20; the income of the banks was \$7,201,817.46, and the dividends were \$5,293,047.14. Eleven trust companies had an aggregate capital of \$1,186,600; deposits, \$5,244,275.18; liabilities, \$7,311,050.15; loans and discounts, \$4,394,042.30; and stocks, bonds, and mortgages, \$1,596,007.57.

Investment Companies.—The Bank Commissioners reported separately 6 foreign mortgage and investment companies chartered by the State, 15 similar companies chartered by other States and licensed to transact business in Connecticut, and 6 building and loan associations similarly chartered and licensed.

Savings and Loan Associations.—The report of the Bureau of Labor Statistics for the year ending Nov. 30, 1894, treats largely of the savings and loan associations of the State. There are 16 such organizations, all but 1 chartered. Fourteen had authorized capital ranging from \$900,000 to \$1,000,000 each, and aggregating \$9,500,000; in 2 the amount was not limited. All organizations had mortgage loans of \$704,522.13; stock loans, \$28,443.84; cash on hand, \$45,285.14; and total assets, \$790,605.02. At the end of the year there were 20,493 shares outstanding, having a maturity value of \$4,108,850.

Insurance.—The report of the Insurance Commissioner, submitted Feb. 23, 1895, treats separately of (1) fire, marine, fidelity, and casualty companies, and (2) of life and accident companies. Of the former there were 8 local stock companies, with total paid-up capital of \$10,000,000, liabilities \$27,083,339.14, and surplus \$7,448,618.62; 17 local mutual companies, with liabilities \$379,944, and surplus \$1,283,007.97; 58 stock companies of other States, with paid-up capital of \$30,347,025, surplus as regards policy holders \$56,888,883.83, and surplus over all liabilities \$22,400,866.22; 5 mutual companies of other States, with surplus as regards policy holders \$1,145,200.32, and surplus over all liabilities \$1,045,200.32; and 22 companies of other coun-

tries, with deposits in the United States, \$4,866,000; assets in the United States, \$57,543,344; surplus as regards policy holders, \$17,082,029.10; and surplus over all liabilities, \$13,282,029.10. Of the second class of companies, aggregating 58, 29 carried on a life business on the old-line plan; 16, including 1 which insures live stock, followed the assessment plan; and 13 did an accident business exclusively, and 3 life companies partially. Twenty-four companies were joint-stock, 34 mutual, 12 had State charters, 44 were chartered in other States, and 2 belonged to London, England. On Dec. 31, 1894, excluding the industrial policies, there were in force over 36,000 policies on the lives of people of the State, carrying nearly \$75,000,000 of insurance, about one third in number and amount being held by companies chartered by the State.

Railroads.—The total single-track length of railroads is 2,583.45 miles. The outstanding capital stock of the corporations on June 30, 1894, was \$90,006,840.88; bonded and other indebtedness, \$54,253,976.85; gross earnings of the year, \$32,444,313.38; operating expenses, \$23,315,520.56; net earnings, \$9,128,792.82; dividends, \$4,572,573.50; taxes paid to the State, \$733,447.36; value of all railroad property, \$159,633,825.61.

Agriculture.—The United States Department of Agriculture reported as follows on the principal crops of the calendar year 1894: Corn, 45,299 acres, 1,404,269 bushels, value \$954,906; oats, 23,502 acres, 606,352 bushels, value \$360,731; rye, 16,098 acres, 207,664 bushels, value \$134,982; buckwheat, 3,956 acres, 64,878 bushels, value \$43,468; tobacco, 6,713 acres, 10,176,908 pounds, value \$1,628,305; potatoes, 26,012 acres, 2,054,948 bushels, value \$1,397,365; and hay, 517,699 acres, 450,398 tons, value \$7,008,193; total value, \$11,427,937.

Live Stock.—In January, 1895, the United States Department of Agriculture estimated the number and value of farm animals in the State as follows: Horses, 43,478, value \$2,660,204; milch cows, 137,582, value \$4,042,159; oxen and other cattle, 73,042, value \$2,085,891; sheep, 37,934, value \$123,243; and swine, 52,172, value \$603,940; total value, \$9,515,537.

Factory Inspection.—During the year ending Nov. 30, 1894, the Inspector of Factories examined or caused to be examined 1,154 factories and places where machinery was used, an excess of 678 of the number examined in the preceding year, and of 665 of the number ever examined in a single prior year. In 379 of the establishments visited the conditions as respects safety to the life and health of those employed therein were entirely satisfactory, and in the remaining 775 it was considered necessary to order a total of 1,789 changes, 1,450 to insure greater security against accidents, and 339 to promote the health of the operatives.

Periodicals.—The newspapers and periodicals number 213, of which 43 are daily, 1 semi-weekly, 113 weekly, 2 biweekly, 2 semimonthly, 44 monthly, 2 bimonthly, and 6 quarterly publications.

Legislative Session.—The General Assembly, which adjourned on July 9, had the longest regular session on record since 1887, when biennial sessions were established. Among its acts

are the rejection of the Australian ballot system; modification of the present ballot law; legalizing the use of ballot machines in town, city, and borough elections; passage of a corrupt-practices act; establishment of a State reformatory on an initial appropriation of \$50,000; extension and strengthening of the criminal laws; prohibition of the sale of falsely marked food articles and candy, and of false marks concerning the purity of gold and silver articles; passage of several amendments to the insurance laws; abolition of days of grace and making Saturday afternoon a bank half holiday; improvement of the jury system by a law designed to weed out professional and incompetent jurors; repeal of the peddlers' license law of 1893; raising the age of consent from fourteen to sixteen years; grant of a city charter to Putnam, making it the eighteenth city in the State; defeat of an antilobby bill; creation of a highway commission; defeat of a bill to extend woman suffrage to all local elections, also of one to deprive women of the right to vote in school-district meetings; fixing uniform license fees; and prohibition of the crossing of steam and electric railroads at grade.

Constitutional Changes.—A compilation of the Constitution and its 28 amendments was adopted in the form of a constitutional amendment. This amendment codifies the organic law with all the amendments between 1828 and 1886, and will go to the General Assembly of 1897 for approval.

Political.—Town elections were held on Oct. 7, with only local affairs at issue. The returns showed slight Democratic gains over the vote of 1894, and a considerable decrease in the vote of women.

COREA. (See KOREA.)

COSTA RICA, a republic of Central America. The Congress is composed of a single Chamber of 21 Representatives, elected for four years by electoral colleges chosen by all respectable citizens. Elections for one half the members take place every two years. The President is elected for four years in the same manner.

Rafael Iglesias was elected President for the term ending May 8, 1898.

Area and Population.—The area is estimated officially at 23,000 square miles. Geographers make it 20,980 square miles. The population, according to the census of Feb. 18, 1892, was 243,205, consisting of 122,480 males and 120,725 females. The actual population was believed to be about 12 per cent. greater. There were 3,500 uncivilized Indians. The number of marriages registered in 1891 was 1,000, and of births 7,684; but the registration is not complete. The number of deaths was 8,489. The immigration was 6,230, and emigration 3,706.

Finances.—The revenue for the fiscal year 1893-'94 was estimated at 4,800,000 silver pesos, and the expenditure at 4,741,840 pesos.

A compromise was effected with the foreign creditors in 1887, in accordance with which 42,000,000 sterling of new obligations were issued bearing 5 per cent. interest. This debt was assumed by the Costa Rica Railway Company. The internal debt amounted in 1892 to 2,811,100 pesos.

Commerce and Production.—Coffee planting is exceedingly profitable in Costa Rica, the

quality of the product being very high. The plantations have been rapidly extended. The cultivation of the banana is increasing likewise. In 1893 the coffee crop was 197,349 bags. Of bananas, 1,278,647 bunches were produced. The yield of sugar in 1891 was 162,804 quintals. Other crops are corn, rice, wheat, and potatoes. The gold and silver mines produce about 128,000 pesos a year. The total value of the imports in 1893 was 5,833,427 pesos, and of the exports 9,619,064 pesos. The values of the chief exports were: Coffee, 8,304,930 pesos; bananas, 786,493 pesos; hides and skins, 138,431 pesos; cedar, 98,891 pesos; other woods, 87,640 pesos. Of the coffee exports, 4,586,870 pesos went to Great Britain, 1,954,298 pesos to the United States, and 1,713,536 pesos to Germany. Of the total imports, 1,697,944 pesos came from Great Britain, 1,399,615 pesos from the United States, 1,123,836 pesos from Germany, and 807,761 pesos from France.

The development of the coffee country has made Costa Rica not only one of the richest agricultural countries for its size, but one in which wealth is most evenly distributed. Most of the peons who used to work on large plantations have taken up Government land and planted small patches of coffee trees. Labor has therefore become scarce for employing planters, and the prices of food are very high.

Navigation.—There are only 3 merchant vessels owned in Costa Rica, of 846 tons, 2 being steamers, of 528 tons. There were 356 steamers, of 420,811 tons, and 22 sailing vessels, of 10,673 tons, entered at the ports of Limon and Punta Arenas during 1893.

Communications.—The railroad from Limon, the Atlantic seaport, to Alajuela, 147 miles, is ultimately to be connected with the railroad that is being built from Punta Arenas, on the Pacific, of which 14 miles have been finished and are in operation.

The telegraphs have a length of 630 miles. The number of dispatches in 1891 was 223,231. The post office carried 838,051 domestic and 752,686 international letters and other mail matter.

CUBA, a colony of Spain in the West Indies. The Governor General is assisted by a Council of Administration, the members of which are appointed by the Crown. The colony sends 16 representatives to the Senate and 30 to the Congress in Madrid. The Governor General, or Captain General, in the beginning of 1895 was Gen. Emilio Calleja. The military forces are restricted on the peace footing to 20,414 men of all arms.

Area and Population.—The island has an extent of 41,655 square miles, with a population estimated in 1887 at 1,631,687 persons, 882,600 males and 749,087 females. Havana, the capital, had 200,448 inhabitants; Santiago in 1892 had 71,307 and Puerto Principe 46,641.

Finances.—The revenue for the year 1893-'94 was estimated at 24,440,759 pesos, of which 11,375,000 pesos came from customs, 7,249,500 pesos from direct and indirect taxes, 3,104,000 pesos from the public lottery, 2,174,659 pesos from stamps, 399,000 pesos from public property, and 138,600 pesos from other sources. The budget of expenditure was 25,984,239 pesos, of which

12,574,485 pesos were for the debt, 5,004,084 pesos for the military, 4,015,034 pesos for the interior, 1,056,831 pesos for the naval force, 991,832 pesos for justice, 736,045 pesos for public works, and 705,928 pesos for finances. The debt is reckoned to be over \$180,000,000.

Commerce and Production.—Of 718,204 tons of sugar exported in 1893 the United States took 680,042; the total product was 815,894 tons. The export of molasses to the United States was 7,654 hogsheads. Of 9,308 pipes of rum exported 2,756 went to Spanish-American countries. The quantity of tobacco exported was 227,865 bales; the number of cigars was 147,365,000, and of cigarettes the export was 39,381,433 packages. Two thirds of the raw tobacco and nearly half the cigars went to the United States. Other exports are mahogany and other woods, honey and wax, and fruits, and of minerals, iron, manganese, and copper. The official value of the total exports in 1892 was \$2,652,513 pesos. The imports were valued at \$5,265,215 pesos, of which 18,553,307 pesos came from Spain, 16,245,880 pesos from the United States, and 12,051,384 pesos from England. The largest imports are flour, rice, and jerked beef.

Communications.—There are 1,000 miles of railroad in operation, besides private lines running to the large sugar plantations. The length of telegraph lines is 2,810 miles; the number of messages in 1892 was 298,416. The number of vessels that entered the ports of Havana, Santiago, Cienfuegos, Trinidad, and Nuevitas in 1893 was 1,953; tonnage, 2,384,263.

The Reform Bill.—Ever since Spain lost her colonies on the American continent the Cubans have striven to gain their independence. Besides the slave insurrections of 1812, 1814, and 1848, revolutionary wars broke out in 1830 and 1868. The latter was protracted ten years and cost Spain 300,000,000 pesetas and 100,000 men, most of them victims of yellow fever. When slavery was abolished in 1880 fresh disturbances ensued. The majority of the slaveholders, who received no compensation, joined the party of independence. The introduction of the Spanish Constitution in 1884 brought little improvement, and material conditions have since then grown worse, owing to the decline in the price of sugar. The failure of the Spanish Government to renew the treaty of reciprocity with the United States, thus closing the natural market for the island, aggravated the evils, and when, instead of seeking another outlet for their products, Spain closed her own markets to the Cubans by the imposition of high duties upon sugar, alcohol, coffee, cacao, and tobacco, the people of all parties in Cuba were exasperated.

The Cuban exiles in Key West, New York, and other cities of the United States, and in Costa Rica, Honduras, Santo Domingo, and other parts of Spanish America, have been planning a new uprising for several years. The desire of the Cubans for national independence has been quickened by what they have suffered from Spanish misgovernment. Shut out from all control over their own affairs, they are burdened by an enormous public debt and crushed by taxes and Spanish protective duties. In addition to \$38,000,000 of state taxes, they pay \$11,000,000 a year in municipal taxes for the

support of officials, soldiers, and police who oppress them. The offices are the spoils of Spanish politicians, civil and military, whose only interest in the country is to obtain riches, and whose administration has been so tyrannical, rapacious, and corrupt as to call for frequent investigations, and many offenders have been dismissed, without checking the evil. Emilio Calleja, who had been sent out as Governor General because he was an eager advocate of Cuban reform, accomplished nothing in the way of eradicating the abuses under which the Cubans groaned.

No Spanish politician has been found who would propose the granting of independence or the cession of Cuba to the United States. Previous to the American war of secession proposals were made to purchase the sovereign rights of Spain for \$120,000,000; but the suggestion was treated as an insult, and almost led to war between Spain and the United States. When overtures were renewed in 1889, Sagasta said there was not enough gold in the world to buy the island. There are two parties among the Cubans, the party of Cuba Libre, ready to fight for independence because it can only be achieved through revolution, and the Autonomists, who desire home rule such as is enjoyed by the Canadians. Autonomy has been promised in various forms, but every legislative proposal has failed, owing to the resistance of the patronage dispensers and the dominant coterie in Cuba. When the Liberals were at last won for radical reform, the Conservatives resisted. Maura, in 1894, as Colonial Minister, brought in a bill to unite the six provincial councils so as to form a legislative body, with which was combined an executive or state council to carry out its enactments, the latter consisting of 30 members, half of them to be appointed by the Crown and half elected by the Cubans. His bill was lost, and he resigned; but later the Conservatives felt compelled to take up the project in a modified form. In November Maura was recalled to the ministry, and a new bill was submitted to the Cortes. The new plan was not to have a centralized parliament, but to confer on the existing provincial councils extensive legislative powers in regard to commerce, communications, public works, immigration, and the like. The Central Executive Council was retained, to be controlled by another body having power to dissolve it, composed of the highest dignitaries of the colony. The project was approved by the almost unanimous vote of the Chamber on Feb. 14, 1895, and by the Senate as well. It did not go far enough to satisfy the Autonomists, while the Separatists regarded it as useless. Ten days after the passing of the bill a revolution broke out in the island.

The Revolution.—For two or three years the Cuban exiles in the United States and Spanish-American countries, veterans of the revolution of 1868-'78 and younger champions of a free Cuba, organized clubs, collected a war fund, purchased munitions of war, and laid plans in concert with their compatriots in Cuba for a new struggle for independence. There were 140 revolutionary clubs in North and South America, Cuba, and other West India islands affiliated under the name of the Revolutionary party, ready to support a revolutionary uprising

SANTIAGO, CUBA.

with financial and moral aid. Cuban working-men in the United States promised to contribute a tenth of their earnings or more, if necessary. There were firearms on the island that had remained concealed since the former war, some had been bought from corrupt custodians of the Government arsenals, and many were smuggled in and hidden away, including 1,000 Mauser rifles. An expedition that planned to sail in the yacht "Lagonda" from Fernandina, Fla., on Jan. 14, 1895, was broken up by the United States authorities. Gen. Antonio Maceo, its leader, with José Martí, the political organizer of the new movement, went to Santo Domingo, where they could confer with the revolutionist leaders living in Cuba.

The plan of the revolutionists was to rise simultaneously in 6 provinces on Feb. 24. The leaders on the island and the organizers abroad had a thorough understanding. The insurrection broke out on the appointed day, but only in Santiago, Santa Clara, and Matanzas. The latter two are comparatively populous provinces, in which the national troops could occupy strategic points and begin effective offensive operations; but in the wooded, mountainous province of Santiago the insurgents knew plenty of hiding places from which they could harass and gradually exterminate the Spanish troops.

Captain-General Calleja had only 15 battalions, or 9,000 troops, though the nominal strength of the forces maintained on the island is from 20,000 to 30,000. These were not enough to garrison the towns, even when re-enforcements arrived, consisting of 4,200 recruits. Thirteen gunboats were maintained in Cuban waters, but of these only 7 were available to guard 500 leagues of coast line, and they were inferior vessels of low speed.

On the appointed day, Henry Brooks, a planter of Guantanamo, raised a band, which was chased by the Government troops, but escaped into the mountains, losing 3 prisoners. In another part of Santiago province Guillermon Moncada took the field with a large band of negro insurgents. In Matanzas, Manuel Garcia, a noted revolutionary leader, recruited men in the vicinity of Aguacato, where he was betrayed into the hands of the Spaniards and killed. Another band was collected at Ybarra, which was surprised by the troops, and 2 rebels were killed. In the same province of Matanzas the troops came upon a quantity of hidden arms. The baggage of passengers from New York was searched for smuggled weapons, and all the available gunboats and revenue cutters were set to guarding the coasts so as to intercept contraband cargoes and prevent the landing of expeditions. The Governor General proclaimed martial law in Santiago and Matanzas. The regular troops were called to arms and detachments were hurried into the two disturbed provinces. Julio Sanguilly, J. Aguirre, and other Cubans who had taken part before in revolutionary movements, were incarcerated in the Cabanas prison at Havana. Many prominent citizens departed for the interior from Santiago de Cuba and Havana or went abroad to avoid arrest. In some places the insurgents were well armed, in others they had only *machetes*. As soon as a band was formed it vanished into the

mountains and swamps, where the troops dared not follow. From safe retreats the rebels made raids upon the plantations of loyalists. Many plantations were denuded of laborers, who ran away in order to take part in this guerrilla warfare. Commander Perico Perez, who marched with Gen. Lachambre from Santiago with 500 native militiamen to seek the rebels, deserted with his sharpshooters and joined Brooks in his fastness. Soon there were between 4,000 and 5,000 rebels in the field, but they had no experienced leaders yet and were not organized for common action. The exiles had been thoroughly organized by Martí and his associates. In the United States, where the main funds were collected and the munitions were procured, there was a revolutionary committee, of which Gonzalo de Quesada was secretary, and Benjamin J. Guerra treasurer. The most extensive local insurrection occurred at Baire, from which town 200 men went as a deputation to Santiago to present their demands to Gen. José Lachambre, the military commander. Young men of Santiago and its vicinity formed companies and went up into the mountains. The arms and ammunition supplied by the revolutionary committee were landed from small vessels that ran over from West Indian or United States ports and eluded the coast patrol. The committee was supposed to have a fund of \$1,000,000. The expected uprising in Havana did not take place, owing to the inactivity of Julio Sanguilly, who, instead of placing himself at the head of the insurrection, was believed by the Cubans to have betrayed their plans for money. Bartolome Masso, after recruiting a large band in Manzanillo, went into the province of Havana with Amador Guerra and Enrique Céspedes, and attempted to organize the rebellion in the vicinity of the capital, where, however, the revolutionists dared not show themselves openly. The disturbances were confined to the southeastern part of the island. The movement spread into Santa Clara, where Matagas raised a formidable and active force. The Spanish troops under Gen. Luque broke up two bands near Cienfuegos and took 20 prisoners, but fell back before the main body, led by Matagas, who moved toward Colon, his force constantly increasing. Here and in Matanzas the Spanish troops were able to hold the movement in check. In Matanzas a large number of the followers of Antonio Lopez Coloma were surprised and made prisoners on a plantation where they rendezvoused, and some of them who fled with Gen. Juan Gualberto Gomez were caught. The bands that were raised by Guillermon Moncada and by Amador Guerra made their way to the pathless mountains. A lively fight occurred at Jaguey Grande with a band led by one Maseros. The band of Eratin Manero was surprised and many prisoners were taken. A force commanded by Major Capilla marched from Manzanillo against the town of Vequita, and on Feb. 26 attacked 340 insurgents who were intrenched there. In Sevilla the revolutionists under the command of Gen. Guillermon Moncada repelled the attack of 1,500 of Brig.-Gen. Lachambre's regular troops, and subsequently captured a plantation guarded by soldiers. On a plantation near Guantanamo the Spanish guard was captured.

Lieut.-Col. Hax, in seeking for insurgents in the same neighborhood, came upon a large body near Ulla, which was joined by others led by Henry Brooks and Perico Perez; they were attacked on the flank by the Spanish troops and, lacking ammunition, were forced to retreat. In the first week in March Gen. Barrido captured Baire, taking 47 prisoners, but the town was immediately reoccupied by the insurgents. Gen. Garrich routed a band at Los Negros. The forces of Matagas, who led the rebellion in the central part of the island, met with a fresh reverse early in March, when Joaquin Pedrosa and Carlos and Jorge Aguirre surrendered with their followers. Many enthusiastic young Cubans of respectable families who joined the insurgents took advantage of the proffered amnesty and returned to their homes because they found themselves associated with bands of brigands like that of Matagas, or with negroes led by mulattoes. The rising in Santa Clara, an independent revolt in the vicinity of Holguin, one in Pinar del Rio started by Gen. Azcuy, and finally the rebellion in Matanzas, subsided. Projected movements in Puerto Principe came to nothing. The disturbances were still confined chiefly to the southeastern part of the island. But there 6,000 rebels in arms successfully defied the Government.

A battalion was at once brought over from Puerto Rico, and a force of 7,000 men was sent from Spain. The prefects in all the provinces resigned, and were replaced by military officers. In Havana fresh arrests were made of prominent citizens until Morro Castle was filled with prisoners. On March 7 the Spanish Cortes granted unlimited credit for the purpose of stamping out the rebellion. The civic guard in Havana refused to march against the rebels in Santiago. In the mountains of that province they were invincible. Santa Clara, as well as Santiago and Matanzas, was declared in a state of siege. The Spanish authorities had asserted in the beginning that no rebellion existed, only an epidemic of brigandage. When compelled to admit that they had to deal with a political insurrection they reported daily the capture of some leader and the rout and dispersion of his band. The bands, however, were heard of later, and preparations for the suppression of the revolt took on increasing proportions. Whereas it was thought sufficient in the beginning to send 2,000 men to Cuba, it was decided early in March to dispatch 20,000 troops and to intrust the work to Field-Marshal Martinez Campos, who had gone out in 1876 and brought to an end in 1878 the ten years' revolution, since when he has been known as the Pacifier of Cuba. Martial law was proclaimed over the whole island.

The United States consul general made a demand that Sanguilly, Aguirre, Peraza, and Carrillo, American citizens held as political prisoners, be tried by the civil courts with benefit of counsel, and not by court-martial. The Governor General complained of the consul general, Ramon O. Williams, and asked the Spanish Government to demand his recall. The Government at Washington took every precaution to prevent armed expeditions and vessels from slipping out of American ports to aid the insur-

gents. The Spanish man-of-war "Infanta Isabel" anchored at Key West to watch the shipping there, ready to chase any suspicious craft that put to sea. Minister Taylor in Madrid informed the Spanish Premier that the United States Government would do its utmost to prevent the fitting out of filibustering expeditions.

Two American sailors, August Bolten and Gustave Richelien, who landed in a small boat in distress and were imprisoned at Santiago de Cuba, were tried by the civil court at the demand of the United States consul and were acquitted of complicity in the rebellion. American citizens of Cuban birth arrested in Santiago secured the benefit of legal trial through the intervention of the consul.

Col. Santocildes had an encounter with insurgents near Guantanamo on March 10. On March 17 Col. Bosch engaged the bands of Perez and Brooks near Ulla. In Santiago the Government forces were unable to cope with the rebels, who soon occupied and fortified some of the towns and began to levy taxes. Besides the bands of Amador Guerra, Esteban Tomayo, and other guerrilla chiefs, who had about 1,200 men, and the larger forces of Henry Brooks and Quintin Banderas, Jesus Rabi held Baire and Jiguani with 1,500 men and Bartolome Masso had 1,000 men at Manzanillo. On March 22 Masso ambuscaded a convoy south of Holguin and captured arms, ammunition, and commissary stores, and later he inflicted a defeat on Gen. Garrich. The Spaniards under Col. Santocildes met with a more serious reverse at Bayamo, losing 300 men and being saved from annihilation only by the arrival of re-enforcements. On March 24 there was a pitched battle at Jaraguana between 600 infantry and 300 cavalry under Amador Guerra and 1,000 troops commanded by Col. Araoz, who formed his men into a hollow square to meet five charges of the Cuban horsemen, and finally assumed the aggressive, compelling the assailants to retreat.

A commission sent to make terms with the eastern rebels was angrily rebuffed by Gen. Masso, who threatened to execute upon Baptista Sportorno, formerly President of the Cuban republic and now a leader of the Autonomists, his own decree of death to any commissioner proposing terms short of the independence of Cuba. The men of standing were still waiting for the action of the leaders of the movement abroad and would have nothing to do with the rebels in the field whose predatory tactics repelled them.

José Martí and Maximo Gomez issued on March 25, from Monte Cristi, Hayti, the following manifesto:

The war is not against the Spaniard, who, secured by his children and by loyalty to the country which the latter will establish, shall be able to enjoy, respected and even loved, that liberty which will only sweep away the thoughtless who block its path. Nor will the war be the cradle of disturbances which are alien to the tried moderation of the Cuban character, nor of tyranny. Those who have fomented it and who are still its sponsors declare in its name to the country its freedom from all hatred, its fraternal indulgence to the timid Cuban, and its radical respect for the dignity of man, which constitutes the sinew of battle and the foundation of the republic.

And they reaffirm that it will be magnanimous

with the penitent, and inflexible only with vice and inhumanity. In the war which has been recommended in Cuba you will not find a revolution beside itself with the joy of rash heroism, but a revolution which comprehends the responsibilities incumbent upon the founders of nations.

Cowardice might seek to profit by another fear under the pretext of prudence—the senseless fear which never has been justified in Cuba—the fear of the negro race. The past revolution, with its martyrs and generous though subordinate soldiers, indignant as does the long trial of exile as well as of the struggle in the island, the menace of a race war, with which our Spanish beneficiaries would like to inspire a fear of the revolution.

The war of emancipation and their common labor have obliterated the hatred which slavery might have inspired. The novelty and crudity of social relations consequent to the sudden change of a man who belonged to another into a man who belonged to himself are overshadowed by the sincere esteem of the white Cuban for the equal soul, the desire for education, the fervor of a free man, and the amiable character of his negro compatriot.

To the Spanish inhabitants of Cuba, instead of the hateful spite of the first war, the revolution, which does not foster fear, expects to find such affectionate neutrality or material aid that through them the war will be shorter, its disasters less, and more easy and friendly the subsequent peace in which father and son are to live. We Cubans commenced the war; the Cubans and Spaniards together will terminate it. If they do not ill treat us we will not ill treat them. Let them respect and they will be respected. Steel will answer to steel, and friendship to friendship.

On March 31, Antonio Maceo, with Flor Crombet and 20 other officers, including Dr. Frank Agramonte and José Maceo, arrived from Costa Rica with an expedition equipped with rifles and cannon. The Spanish Government sent 3 torpedo gunboats to re-enforce the fleet of 8 cruisers that guarded the coast, but too late to intercept the principal expeditions. Gen. Lachambre's soldiers attacked Gen. Maceo's party in the village of Duaba immediately after it landed at Baracoa, but were repulsed with the loss of 10 killed and 9 wounded. They attempted to intercept the invaders again at Cuchillas and to overtake them at Manzanillo. The British schooner "Honor" that brought them was wrecked, and the crew were taken prisoners by Spanish soldiers, who killed the captain. Frank Agramonte and another American citizen were among the members of the expedition who were taken by the Spaniards. They were kept in prison, and on the urgent demand of the United States consular authorities the Government promised to give them a civil trial.

An attempt was made in Havana to liberate the prisoners in the Cabanas and Morro Castle and to blow up the powder magazine in the harbor. Wholesale arrests were made in the city. Consul-General Williams intervened in behalf of José Carballo, an American citizen, arrested as a spy.

On the arrival of re-enforcements from Spain a large force was sent against Maceo in the eastern province. He was reported to be defeated and hemmed in at Monteverde, near Guantanamo. On April 13 a part of his force sustained a defeat near Palmerito, when by surprise it was surrounded by 3,000 Spaniards, and cut its way through with heavy losses. The commander, Flor Crombet, a revolutionary hero,

was one of the slain; but he was killed by a traitor in his own party, one Rojo, who was afterward caught and hanged by Maceo. Elsewhere the insurgents were aggressively active. Engagements occurred daily, in which the Government forces were usually worsted. The bands raided small towns and held them long enough to replenish their supplies. Rabi thus occupied Victoria de Las Tunas, near Puerto Principe; and Caney, near Santiago de Cuba, was captured and the armory plundered, Capt. Ramon Silvester being made prisoner. In Matanzas, Cardenas, and other places the revolutionists resorted to explosives. The resident Spaniards, especially the workmen, joined the insurgents openly in increasing numbers, or gave them secret aid.

A provisional government was proclaimed by Maceo, with Dr. Tomas Estrada Palma as Provisional President of the Cuban Republic, José Martí as Secretary General and Diplomatic Agent Abroad, and Gen. Maximo Gomez as Military Director and Commander in Chief of the Forces.

Marshal Martinez Campos, who succeeded Calleja as Captain General and commander of the forces, arrived with re-enforcements on April 16 at Guantanamo. On the day following he issued a proclamation pledging himself to carry out all the promised reforms, if supported by the non-Separatist elements. The constitutional parties were the Conservatives and Reformists, composed mainly of Spaniards, and the Autonomists. The leaders of these parties declared in favor of the Government, and as the Autonomists included some of the most prominent supporters of the late revolution, the official attitude of the party was a damper to the revolution. Many respectable citizens belonging to this party now, however, seeing that Campos promised no further reforms than those voted by the Cortes, began to give moral support and material aid to the rebellion, and some of the younger ones armed themselves and went to join the insurgents in the field, or left Havana and the other ports on steamers for the United States or the West India Islands, intending to aid in the fitting out of expeditions, which the Spanish naval force could not stop from landing on the coast. Capt.-Gen. Campos offered pardon to all insurgents who would lay down their arms, except leaders. He appointed Gen. Garrich governor of the province of Santiago, with Gen. Salcedo as commander of the First Division, having its headquarters at Santiago de Cuba, and Gen. Lachambre commander of the Second Division at Bayamo.

The Spanish Cortes authorized the Government to raise 600,000,000 pesetas for the suppression of the rebellion, and decided to increase the force of regular troops in Cuba, of which there were now 23,000, to 40,000, and to get 40,000 more ready to sail in August for an aggressive campaign after the rainy season was over. The raw recruits that came from Spain, mostly boys of eighteen and nineteen, were almost worthless when pitted against the toughened negro guerrillas, who slept on the ground without sickening and submitted when necessary on the wild fruits of the country. The Spanish commissary arrangements were so defective that the troops could not be moved in any numbers. The con-

vows were attacked constantly, and the provisions destined for the outposts were seized by the insurgents, who even raided the cattle pens in Santiago and drove off the cattle. The starved and ragged Spanish soldiers could not fight men who fired from behind trees, and made off whenever they were pursued. They were only good to garrison fortified posts, and there they perished in great numbers from the malarial fever, and had the prospect before them of the yellow fever. Gen. Campos organized some bands of Government guerrillas to fight the insurgents in their own way. After a while he decided to call into the service the young Spaniards settled in Cuba, who were better acclimated than the raw troops from the south of Spain. These emigrants are released from the obligation to serve in the regular army on the condition of their joining the volunteers or home guards in Cuba, in which many of them held commissions. When they were ordered out to serve in the ranks they were inclined to mutiny. He decided later to send for Lolo Benítez, a guerrilla chieftain of the former revolution, who had been condemned for his cruelties to life imprisonment and was a convict in Ceuta, Africa. This man was pardoned and commissioned a lieutenant colonel in the Spanish army, on condition that he would fight his countrymen with their own tactics, of which he was a master. The Spanish officers in Cuba protested when they learned that this bandit was to be sent into the field at the head of convicts released from Cuban jails.

Maximo Gomez and José Martí, starting from Cape Haytien, landed on the coast southwest of Cape Maysi on April 13 with 80 companions, most of them veterans of the former war. They succeeded in joining Perico Perez, whose band of 1,000 cavalry defeated Col. Bosch on April 16 and again on April 18 at Sabana de Jaibo, where Gomez directed the charge. This force united with Maceo, who assumed command of the operations in the east. With his blacks and mulattoes, inured to exposure and privation, he extended his operations until the whole province obeyed him except the Spanish fortified posts. The planters and traders were forced to contribute under the penalty of having their property destroyed. For provisions and store goods the insurgents usually paid, but horses they took wherever they found them, without giving compensation, and beef cattle too, but they were ordered not to kill cows. Juan Castillo was court-martialed and shot by order of Maso for outrages on citizens. Maso held the Bayamo district, west of Santiago, from the middle of March.

The black miners of Juragua went out under the lead of Floriano Gascon, and on April 21 his band, numbering 500 men, surprised 60 soldiers, commanded by Lieut. Benjamin Gallego, who had been left in the village of Ramon de las Jaguas to guard the mines. Major Tejerizo, whose departure had given the opportunity for the attack, hurried back with his 260 men on hearing the fusillade. Supposing the fort to be still held by Spaniards, he approached near enough to receive two volleys, from which he was disabled and Capt. Miranda killed. The insurgents instantly fell upon the demoralized

Spaniards with their *machetes* and put them to rout. They also attacked in a narrow defile a relief column of 150 cavalry and 400 infantry that came up from Songo. In these engagements over 100 Spaniards were killed. Gascon's band, armed only with *machetes* originally, were now provided with 150 rifles and 15,000 rounds of ammunition. Lieut. Gallego was afterward tried by court-martial and shot for surrendering his command without fighting, as was also another officer of the same name who was convicted of cowardice. Capt. Malla, captured while escorting provisions near Bayamo, was placed under arrest when he returned on parole, but the feeling that had been aroused against such severe penalties kept the authorities from executing any more officers. Gascon and his band joined Maceo, who, with the negroes led by Quintin Bandera and the hardy mountaineers of Perico Perez, had now over 2,500 men at Jarajueca. Gen. Salcedo made extraordinary efforts to catch Maceo. He sent out four columns for the purpose of surrounding him, but he passed through the cordon and retreated safely into the mountains. A still more energetic effort was made to head off Gomez and Martí, but with the aid of their friends they found little difficulty in eluding the guards that occupied all the roads.

On April 29 a detachment of 700 Spaniards was decoyed into attacking José Maceo at Arroyo Hondo, near Guantanamo. He had so disposed his force as to surround and fall upon the Spaniards with three men to their one. They fought courageously and finally cut their way through and retreated, having lost 150 killed and inflicted heavy losses on the enemy. Col. Capello, the Spanish commander who was thus entrapped, was relieved of the command at Guantanamo, being succeeded by Brig.-Gen. Bazan.

On May 6 Maceo's men raided Cristo, burning the bridges of the railroads running to Songo and San Luis and tearing up the tracks. A train bringing troops was derailed, and the troops after they left the train were fired upon from an ambush. The same band of insurgents raided Caney also, and burned buildings.

On May 14 at Jobito, near Guantanamo, 400 soldiers were surrounded by 1,200 insurgents led by the two Maceos. Lieut.-Col. Bosch was killed in the first onslaught, but Major Roblos held the position, repelling successive attacks, until re-enforcements came, when the Spaniards advanced and defeated the rebels, who lost 43 killed and wounded, while on the Spanish side 100 were killed and 80 wounded.

A guard of 600 soldiers, while escorting provisions from Santiago to Bayamo, attacked by 800 rebels, fled in confusion, leaving behind the stores and 70 dead and wounded.

A convention was held on May 18 at which delegates representing each 100 revolutionists in the field elected Bartolome Maso President of the Cuban Republic, Maximo Gomez General in Chief, and Antonio Maceo Commander in Chief of the Oriental Division.

Martí intended to embark for Jamaica, while Gomez was about to proceed in the direction of Camaguey, escorted by the forces of Maso. On May 19, while Maso with the bulk of his troops

had gone to intercept a convoy, and Marti had just parted from Gomez, who had 700 cavalry, a treacherous guide directed Col. Sandoval and 800 men to a narrow ravine, where Marti and his staff would be entrapped. The entire party of 50 was annihilated, Marti leading them in a desperate charge, before Gomez arrived. His force was surrounded, and with difficulty fought its way through the Spanish lines. Gomez himself, in an attempt to rescue Marti's body, was wounded, and was helped off the field by Col. Borrero. The Cubans then retreated in disorder, having lost about 50 killed and 100 wounded, while the Spanish loss was 5 killed and 6 wounded. When the revolutionary party, after long doubting, was convinced that Marti was indeed dead it chose Dr. Tomas Estrada Palma to succeed him as the delegate of the Cuban republic to the United States and other foreign countries, and also as president of the party. Manuel Sanguily was associated with him later as representative of the Cuban cause in the United States.

The insurgents destroyed the village of Palesma by fire on May 12, and burned buildings in Palenque, and on May 14 they fired the property of Spaniards in Dos Caminos. Besides the 3,000 men that Maceo had concentrated in the vicinity of Jarajueca, there were 2,000 under arms in other parts of Santiago. José Maceo had 700 men near Guantanamo, and Maso 500 in the Manzanillo district. The whole eastern country was at the mercy of the predatory bands, which prowled even into the outskirts of the town of Santiago. The troops were afraid of them. Yellow fever broke out among the soldiers sooner than was expected. The numbers of the insurgents were constantly augmented by the accession of respectable whites, who had hitherto held aloof, and of laborers leaving the plantations after the sugar-grinding was done. The total force of the insurgents swelled to 10,000 men, of whom 7,000 were armed with good rifles. Gen. Salcedo, after his unsuccessful campaign against Maceo, in which the unacclimated Spaniards proved themselves unable to fight the natives in the mountains and jungles, decided to pursue defensive tactics till the rainy season was over. As a strategic measure, which would also serve as the means of placating the Cuban people, one of whose complaints was that of all their revenue not more than \$250,000 was actually expended on public works, to deter them from joining the rebellion from patriotic motives, and the laborers, by giving them employment, from going into it for spoils and food, the price of which was mounting to famine figures, Marshal Campos proposed to build a railroad across the island from Puerto Príncipe to Santa Cruz, another from Manzanillo to Yara and Bayamo, and a third from Guantanamo to Santiago. He also endeavored to persuade the American syndicate operating the Santiago and Moroto Railroad to construct branches from San Luis to Palma Soriano and from Songu toward the interior plateau. And he proposed to make harbor improvements. His promise to the American company that they might import material for the new railroad duty free was vetoed by the Spanish Government, which would not allow them even to

bring in material to repair bridges, tracks, and rolling stock destroyed by the rebels without paying the duties, which are nearly 100 per cent.

The Spanish war expenses for three months were \$10,000,000; the losses by death up to May 21 were 19 officers and 4,846 men.

Gen. Salcedo issued an order on June 5 directing his columns to fire without warning upon any person found out of doors after dark. The French consul protested. The first result of the regulation was that two squads of Spanish troops marching in contrary directions in the outskirts of Santiago fired several volleys at each other, killing and seriously wounding several men.

New supplies of arms and recruits for the rebels were brought into the island by small fishing smacks or larger vessels in spite of the patrolling gunboats. It was said that 6,000 stands of arms were sent to them from New York at various times. Col. Lacroix and Col. Mariano Torres landed early in May from Jamaica with 220 men. On May 13 the yacht "Corona" brought 45 men from Georgia. This was said to be the sixth expedition that had arrived from the Southern States. The rebels held constant communications with their friends abroad. Suspecting that American newspaper reporters were bearers of messages, and annoyed at the character of the intelligence that they published, Campos gave orders to shoot any correspondent seen coming from the enemy's lines. Later Salcedo ordered all the newspaper correspondents to leave the island.

A filibustering expedition left Key West, under Gen. Carlos Roloff, Gen. Serafin Sanchez, and Gen. José Maria Rodriguez, on June 5, consisting of 353 men, many of them veterans of the last revolution, with 1,000 repeating rifles and ammunition, some small cannon, revolvers, and 500 pounds of dynamite. An American tugboat, the "George W. Childs," which the revolutionary committee had purchased, and an English schooner conveyed the party, which landed in Las Villas, near Sagua La Chica, on the north coast of the province of Santa Clara. Their landing was protected by the bands of Castillo and Reyes, who had nearly 2,000 men in the district. These forces were organized and armed by Roloff, who assumed the command in Las Villas.

The fitting out of the Roloff expedition in an American port caused the United States authorities to redouble their precautions against filibustering. Several more revenue cutters and the cruisers "Atlanta" and "Raleigh" were sent to Florida and the Gulf. On June 12 President Cleveland issued a proclamation warning citizens and others against taking part in the civil disturbances in Cuba, contrary to the laws of the United States, by accepting or exercising commissions for warlike service against the established Government of Spain, by enlisting or procuring others to enlist in such service, by fitting out or arming, or procuring to be fitted out and armed, ships of war for such service, by augmenting the force of any such ship in the ports of the United States, or by setting on foot or providing or preparing the means for military enterprises to be carried on from the United States against that Government. The British authorities in Jamaica also adopted more strin-

gent measures to prevent the shipping of arms and men. One expedition was stopped, and the arms that were on the coast trader "Pearl" were seized as contraband.

Major Rafael Casallas deserted with 400 men of the cavalry regiment of Camajuani. He had an encounter with the Government troops at San José in the Remedios district of Santa Clara, and during the action he was killed by the treachery of his own men.

Before June bands began to form in Puerto Principe, several of which united under Cas-

efficient abettor of the revolution. Other prominent men were in sympathy with it, as Marcos Garcia, who resigned the mayoralty of Sancti Spiritus.

Gomez took command of the rebels in the province of Puerto Principe, and soon he had a force of 2,000 men, with which he held the southern district. But he was unable with this small army, scantily supplied with munitions, to operate against the fortified positions held by the 10,000 troops of Major-Gen. Pedro Mella, the military governor. Marshal Campos tele-

CHORRERA TOWER ("BUCCANEERS' FORT"), AT THE MOUTH OF THE ALMENDARES, CUBA.

tillo. Others were led by bandit chiefs, such as Nicasio, Mirabel, and Muñoz. Miro and Marrero levied contributions around Holguin. Marshal Campos had a cordon of 4,000 troops thrown across the island to guard every road and path by which Gomez could enter Puerto Principe. Nevertheless he slipped through with 300 men, and, crossing the river Jobabo, entered Camaguey on June 2. His force was immediately joined by 700 men, led by a nephew of Salvador Cisneros, Marquis of Santa Lucia, who was an

graphed at once for fresh re-enforcements, and issued an order for the conscripts of 1892, 1893, and 1894 to report for service. The Spanish Government decided to dispatch at once 10,500 troops, besides 1,500 cavalry already on the sea.

The prosperous planters of Puerto Principe, however much they sympathized with the revolution, were unwilling to invite the vengeance of the legal Government by overt acts of rebellion. On June 18 the province was declared to be in a state of siege.

Gomez, with 600 men, captured the village of Abagrana, not far from the city of Puerto Principe, driving out the small Spanish garrison. He tore up the railroad, and afterward burned a good part of the town, being provoked thereto by the act of a Spanish emissary in the Cuban ranks, who shot his aid, Gen. Panchito Borrero, from behind. Gomez burned the villages of San Geronimo and Elmulato, where he surprised the garrisons. In these places he got 300 Mauser rifles with which to arm his men. He harassed Spanish convoys, captured army stores, and destroyed the railroad bridges. Many plantations were destroyed by irregular guerrillas, several of whose leaders were captured by Col. Alfonso Guallet, commander of the regular revolutionary forces in the district, who issued an order forbidding the violation of property rights under pain of death. The accepted leaders themselves levied money contributions on plantation owners, and if these were not forthcoming they devastated their estates. Plantations were destroyed also for the purpose of cutting off the supplies of Puerto Principe, San Miguel, and Nuevitas, and the roads, bridges, railways, and telegraphs were swept away. The Spanish cavalry, after one encounter in Yaguajay, were afraid to meet the Cuban horsemen. In Matanzas the Government was more successful in repressing the revolutionary element, which was not so respectable there as in other provinces. Matagas and Reyes had many encounters with the Spanish cavalry, in one of which the latter was slain.

Several times the filibusters landed arms in the province of Pinar del Rio, but in each case the Government found and confiscated them. One or two attempted risings were put down, as was one in Havana province also; but when the insurrection became general through the eastern and middle parts of the island rebel guerrillas became active in Pinar del Rio.

Marshal Campos endeavored to block the roads by a line of troops from Moron to Jucara in order to prevent Gomez from crossing over to Santa Clara with the rebel army of Camaguey. In that opulent province, whose people gave more support to the rebels, the Government could not hold the revolt in check any more effectively than in Puerto Principe. Lieut.-Col. Velarde reported that he won a victory over 1,000 of Roloff's men who attacked Vega Alta. Zayas, a guerrilla leader who operated in the district of Sancti Spiritus, inflicted a defeat upon a column sent against him at Vista Hermosa, but lost 30 men in a fight with Col. Zamora at Nueva Villa.

In Santiago the Government troops held only the fortified places and failed to protect their lines of communication. On July 1 the rebels lost a dashing fighter in Amador Guerra, who was shot by one of the wounded after he had defeated a band of Government volunteers at Palmas Altas, near Manzanillo. Henry Brooks landed near Portillo with 4 cannon and a quantity of ammunition, which he abandoned to the enemy on being attacked; but, returning with Rabi and 1,500 men on the following day, he regained his own and took the enemy's guns.

On July 2, at Cacao, near Jiguaní, in the Manzanillo district, Major Sanchez with 500 fresh troops was beguiled by a false message into a

narrow defile, where the band of Rabi, 1,500 strong, fell upon the Spaniards with their *machetes*, and killed and wounded 270 before they were compelled to retreat by the deadly fire of some of the Spanish infantry, who gained commanding positions. This Spanish defeat frustrated a plan of Gen. Salcedo to close in upon Maceo's camp at San Jorge with the combined forces of Gen. Navarro and Gen. Gasco.

On July 5 Victoriano Garzon and Quintin Bandera, when attacked by 1,250 newly landed troops under Gen. Garcia Navarro at Gran Piedra, demoralized them with rifle fire from cover followed by a *machete* charge, and captured a large quantity of arms and ammunition. In a later attack on this position the same commander was again repelled.

Capt.-Gen. Campos issued a new proclamation on July 7, promising immunity to insurgents who surrendered, while those caught with arms in their hands would be tried by court-martial and shot, and conspirators against the integrity of the nation would be sent to African prisons.

On July 9 there was an encounter between Victoriano Garzon and Gen. Navarro's troops at Avispero, in which the Spaniards lost 25 killed.

Cuban troops concentrated by Maceo in the district of Holguin regularly besieged Bayamo and captured every train of supplies that was sent out. A force of 1,500 men started from Masaino under Marshal Campos and Gen. Fidel Santocildes for the relief of the starving garrison. It was attacked on July 13 at Peralejo, near Valenzuela, by 2,700 insurgents under Maceo, who made an effort to capture Marshal Campos and his staff, in defending whom Gen. Santocildes was killed. The Spaniards were caught in an ambush and surrounded on four sides. After fighting on the defensive for five hours, they broke through the cordon and retreated to Bayamo, the rear guard fighting all the way. The Spanish loss was 7 officers and 119 men killed. The Cubans, who lost 100 men, captured the Spanish ammunition train. Gen. Campos remained in Bayamo until Gen. Suarez Valdez arrived on July 21 with 1,400 men to protect his retreat over the road by which he came. Songo and the other outposts were practically invested by the insurgents, who disappeared from the neighborhood of Bayamo after they had caused the Government to concentrate 10,000 soldiers there.

Ruen and his guerrillas besieged the garrison of the fort at Sabana, and on July 22 reduced the town to ashes in order to force the troops to surrender. They were relieved at last by Col. Zamora from Baracoa, who inflicted a loss of 30 upon the rebels and escorted the garrison away after destroying the fort. The fortress at Baire was besieged and captured on July 30 by Rabi, who paroled the garrison of 60 men after they surrendered. The Spanish troops under Gen. Garrido afterward retook the place.

The Provisional Government was formally constituted in the valley of the Yara, and a declaration of independence was proclaimed on July 15. In a convention held in the Puerto Principe district on Aug. 7 the following officers were chosen: Provisional President of the Republic of Cuba, Gen. Bartolome Masso; Minister of the Interior, the Marquis of Santa Lucia;

Vice-President and Minister of War, Gen. Máximo Gómez; Secretary of Foreign Affairs, with residence in the United States, Gonzalo de Quesada; General in Chief of the Cuban army, Gen. Antonio Maceo; Commander of the Eastern Army, Gen. José Maceo.

The Spanish forces in the middle of July numbered 39,885 regular infantry, 2,596 cavalry, 621 artillery, 415 engineers, 4,400 civil guards, 2,700 marines, and 1,152 guerrillas. The naval force consisted of 15 vessels, to be augmented by 6 that were building in Spain, and 19 that were to be purchased in England and on the Continent. The insurgent strength was approximately 12,000 soldiers under Maceo in the eastern division, of whom 3,000 were cavalry, 4,000 in Puerto Principe, and 5,000 in Las Villas under Gomez, and 3,000 under Roloff and Sanchez in Santa Clara. Of Maceo's army, 7,000 had Remingtons, Winchesters, and Mausers, and most of the others carried revolvers or shotguns, besides their *machetes*. Matanzas had 400 men in Matanzas.

The commanders of the Spanish forces were changed in the beginning of August. Gen. José Jiménez Moreno succeeded Gen. Salcedo; Gen. Andres Gonzales Muñoz replaced Gen. Lachambre; and Gen. Arsenio Linares relieved Gen. Gasco. The Spanish Government decided to send 30,000 more troops. The losses by yellow fever and other diseases and in battle had already nearly reached 20,000. Gen. Campos ordered the Spanish volunteer companies to transfer each 100 men to the regular army; 1,300 were induced to join on the promise that they would only be required to do garrison duty.

The funds for prosecuting the war were derived from the sale of Cuban bonds of the series of 1890, of which the Spanish Government had 120,000,000 pesos at the beginning of the rebellion. These were disposed of at 40 per cent. of their nominal value, 20 per cent. lower than they were quoted before the outbreak. They thus realized 48,000,000 pesos, nearly half of which were exhausted before Sept. 1, the expenditures having been 23,000,000 pesos.

On Aug. 31 a battle occurred at Sao del Indio, near Ramon de las Jaguas, between the force of José Maceo and 1,300 Spanish troops under Col. Canellas, who succeeded Gen. Bazan at Guantanamo. The Spanish commander marched out, intending to attack the rebel camp at Gran Piedra. The insurgents had laid dynamite mines under all the roads approaching their position, and 5 of these were exploded with deadly effect. The Spaniards ascended one of the passes in the mountains, the Government guerrilla chief Garrido, noted alike for military ability and for barbarity, having seized at the beginning the other. The Spanish regulars pressed bravely up the road, exposed to a galling fire from the heights, and finally brought a field gun into action. They penetrated to the rebel camp, which they destroyed, after which they retired in the night, as Maceo had not only the troops that fought them in the pass, but as many more fresh troops with which to attack them in the morning. A detachment of Cuban cavalry, making a long detour, charged the Spanish rear guard, but were repelled. The Spanish loss was 24 killed and 68 wounded; that

of the insurgents was 36 killed and 80 wounded. Two days later a column of 1,500 men under Gen. Linares was attacked on the flank at Descanso del Muerto by Rabi while conveying stores from Palma Soriano to Remanganaguas and lost 29 killed and 60 wounded and a part of the stores. Gomez attacked a provision train and killed 32 men, but had to retire, finding the convoy stronger than his own force.

The insurgents had increased to over 30,000 by the time the Spanish re-enforcements arrived. The soldiers sent from Spain were not untrained youths, but the flower of the Spanish army. Some of the railroad trains transporting troops were wrecked with dynamite, and bridges were destroyed. Outside of the cities and seaports and the lines of railroad the territory of the central provinces as well as the eastern province was occupied by the rebels; but Matanzas still separated their two fields of operation. Having formed a junction with the forces in Las Villas and Santa Clara, Gomez intended to carry the war into Matanzas, and the Spanish commander in chief, abandoning all serious efforts to attack Maceo in the Oriente, or Gomez in Camaguey, laid plans to prevent this invasion and placed guards in the sugar plantations of Matanzas. The attempt to protect the estates in the revolted provinces had been ineffectual, for the insurgents had overpowered the guards in every case, and destroyed the property as a punishment to the owners for applying to the Government for protection. Only those planters could continue operations who paid the heavy contributions assessed upon them for the support of the revolution.

The strength of the Spanish forces after the arrival of the August re-enforcements was reported to be 59,700 infantry of the line, 3,900 regular cavalry, 2,200 artillery, 1,400 engineers, 2,700 marine infantry, 1,100 mounted guerrillas, 4,400 civil guards, 1,000 police, and 3,600 volunteers. From the total of 80,000 should be deducted the losses, estimated to have been 7,000 killed in skirmishes and battles, 3,500 deserters to the enemy and missing, and 8,000 victims of yellow fever and other diseases. One half of the troops were needed to garrison the cities, coast towns, and strategic outposts, leaving a force available for active operations that was not greater than the revolutionists had in the field. The Spanish authorities planned to blockade the coast effectually with two lines of war vessels. Already the insurgents found it difficult to smuggle arms or men into the island. Enrique Collazo, who planned a fresh expedition from the United States, and other men bent on similar enterprises were closely watched. A party of young Cubans who loaded a vessel with munitions of war in Wilmington, Del., were arrested, and the cargo was seized by revenue officers. They were tried and acquitted, the simple exportation of arms in a merchant vessel being no violation of the neutrality laws. Sailors caught smuggling contraband into Cuba on the steamer "Mascotte" were sentenced in the Marine Court at Havana to seventeen years' penal servitude in Ceuta.

Juan Gualberto Gomez and other members of expeditions who were captured by the Spaniards were tried after months of detention and sen-

tended to twenty years' imprisonment in Ceuta. José María Aguirre, an American citizen arrested for complicity in the revolution, was finally released at the request of the United States Government, but Julio Sanguilly was committed on a criminal charge. He was not tried till the beginning of December, when he was sentenced to life imprisonment. Frank Agremonde and Francisco Sanz, American citizens who came with Maceo, were still confined without trial in Morro Castle.

Republican Government.—Delegates from all the provinces met at Najasa, near Guaimaro, to organize a permanent government. The Marqués of Santa Lucía presided. Mamo, whom the armies of Maceo, Roloff, and Gomez had elected Provisional President, wished to resign, thinking that Gomez should be the executive chief. A constitution for the republic of Cuba was discussed, and various and opposite opinions were expressed regarding the form of government required.

The Congress of Delegates ended its labors on Sept. 25 at Anton de Puerto Principe, where a constitution for the new Cuban republic was adopted and proclaimed to the world. The supreme power of the republic is by this instrument vested in a Council of Ministers, consisting of a President, a Vice-President, and four secretaries, having charge respectively of the Departments of War, the Interior, Foreign Affairs, and Agriculture. Each secretary has a deputy to act in case of a vacancy. The ministerial government has authority to make laws dealing with the civil and political affairs of the republic, to levy contributions and contract loans, to raise and maintain troops, to declare reprisals against the enemy, and, if in the judgment of the Council it is absolutely necessary, to intervene in military operations. The military organization and ordinances as drawn up by the commander-in-chief are subject to the approval of the Council, as also are treaties made by the President, but a treaty of peace with Spain must form an absolute basis of independence for the island of Cuba, and after it has been accepted by the President and by the Council of Ministers it must be submitted for ratification to an Assembly of Representatives convoked for that purpose. No decree of the Ministerial Council is valid unless two thirds of its members concur in it, and unless it has the sanction of the President, who has power to dissolve the Council, in which case a new one shall be constituted within ten days. To be a member one must be twenty-five years of age, and no member can hold another office under the republic. Any member can be dismissed for cause by the vote of two thirds of the Council. The President is the executive chief, or, when he is unable to act, the Vice-President. In case both offices become vacant by resignation, death, or other cause, an Assembly of Representatives will be convened for the purpose of electing a new President and Vice-President. Each Secretary appoints his own subordinates, but every functionary must help to carry out the resolutions of the Council of Ministers. The armaments and operations of the war are placed under the direction of the commander-in-chief, having under him as second in command a lieutenant general,

who in case his chief is incapacitated will assume the supreme command. All Cubans are obliged to serve the republic with their persons and means, according to their power. The property of foreigners is exempt from taxation, provided their respective governments recognize the belligerency of Cuba. All debts of Cuba contracted from the beginning of the war to the date of the promulgation of the Constitution will be paid by the republic. The judicial authority will be entirely independent of the executive and legislative branches of the Government.

The delegates of the provinces elected the following permanent officials of the Government: President of the Republic, Salvador Cisneros, of Puerto Principe; Vice-President, Bartolomé Mamo, of Manzanillo; Secretary of War, Carlos Roloff, of Santa Clara; Assistant Secretary of War, Mario Menocal, of Matanzas; Secretary of Foreign Affairs, Rafael Portuondo, of Santiago de Cuba; Assistant Secretary of Foreign Affairs, Fermín V. Domínguez; Secretary of the Treasury, Severa Pina, of Sancti Spiritus; Assistant Secretary of the Treasury, Joaquín Castillo, of Santiago de Cuba; Secretary of the Interior, Santiago J. Sanínara, of Remedios; Assistant Secretary of the Interior, Carlos Dubón, of Baracoa; Commander in Chief, Gen. Máximo Gómez; Lieutenant General, Antonio Maceo. José Maceo, Maso Capote, Serafín Sánchez, and Fuerto Rodríguez were designated as major generals. Tomás Estrada Palma was appointed minister plenipotentiary and diplomatic agent of the Cuban republic abroad. Gen. Bartolomé Mamo and Gen. de Castillo were afterward sent as special envoys of the republic to the United States.

The Autumn Campaign.—The plan of the insurgents was to raise the standard of revolution over the whole island, compelling Gen. Campos to scatter his forces. When Gómez entered Camaguey and Roloff landed in Santa Clara, troops had to be withdrawn from Santiago de Cuba and other places to garrison points threatened by the rebels in the center of the island. Unless the insurgents were in much greater force than the Spaniards they would not attack; neither would they give the troops any opportunity of attacking, for they knew every inch of territory, and could always outmarch any force that was sent against them. They were able to harass the Spaniards constantly, hovering on their flanks and cutting off small detachments. Even when their ammunition was very low, they could continue these tactics and replenish their supply with what they captured from the soldiers. The plan of the rebels was to render the situation intolerable by stopping all commerce and production. Gómez issued a proclamation ordering the inhabitants of the province of Puerto Principe to cease from all plantation work under penalty of the destruction of their property, also forbidding them to supply provisions to the garrisons in the towns. Gen. Campos promised to drive the rebels out of Santa Clara and Matanzas before the time for cutting the sugar cane came round. Yet he did not begin aggressive operations in October, though he had 80,000 men, three times as many as the revolutionists. Of the Spanish troops, 25,000 were thrown into Santa Clara, while the rest were scattered over the island for the de-

ence of seaports and important places. There were 1,300 volunteers enlisted and brought to Cuba from the Argentine Republic. The rebels in Santa Clara numbered 10,000. Many well-known citizens joined the rebellion after the Spanish re-enforcements arrived in September. Most of the Autonomists in the provinces took that side. The insurgents became very active, blowing up railroad bridges and culverts, cutting telegraph wires, and destroying villages and plantations. Whenever troops were transported they attempted to derail the train, and sometimes succeeded. A great number of Spanish laborers out of work and in danger of starvation joined the bands of Matagas and other guerrillas. Exhibitions of sympathy with the revolution caused the Government to renew the wholesale arrests in Havana, which led in turn to a fresh exodus to Santo Domingo and other countries. The paralysis of trade and the destruction of plantations and exactions of both the Spanish and the revolutionary governments caused extreme financial stringency and distress among all classes.

The Spanish cruiser "Sanchez Barcaiztegui" was accidentally sunk in Havana Bay on Sept. 19, in a collision with the passenger steamer "Mortera." The loss was 46, including nearly all the ship's officers and Rear-Admiral Delgado Parejo, the chief naval officer at Havana. On Sept. 29 the cruiser "Cristobal Colon" was wrecked off Bajos de los Colorados.

The insurgents had great difficulty in obtaining ammunition, as supplies destined for them had been intercepted. The schooner "Lark" was seized by the United States authorities in Florida and fined for violation of the navigation laws, while 33 Cuban filibusters who were on board were set free. Stores of ammunition were found on some of the British West India Islands and were confiscated. Gomez, on account of shortness of ammunition, was unable to accomplish anything against Mella, but when the latter marched through the province of Puerto Principe with 3,000 men for the purpose of attacking the rebels these had no difficulty in eluding the Spanish troops. The guerrillas in the Remedios district were pressed by Gen. Luque, who captured their camps at Peralta and Jaelita, and killed 37 in capturing their hospital. Gomez and Antonio Maceo planned to invade Matanzas. When the rebel army was organized under the new Government Gen. Maceo was continued in charge of operations in Santiago, Guantanamo, Baracoa, and Mayori; Gen. Maso Capote took command of Las Tunas and Guaymara; Gen. Sanchez directed operations in Las Villas; and Gen. Rodriguez was placed in command in Camaguey in conjunction with Gen. Gomez. The rebel troops in this district numbered only 5,500 men, while in the east Maceo and his subordinates had 28,300.

An engagement was fought on Sept. 25, near the river Guayabal, between 1,800 men under Gen. Echague and a body of rebels commanded by Gen. Maceo. The Cubans claimed a victory near Hatillo, in which the Spaniards, under Lieut.-Col. Tejeda, though 900 strong, outnumbering them two to one, were driven from the field, losing 18 killed and 74 wounded. Gen. Roloff issued a circular on Sept. 30, saying that it would be dangerous for the public to travel

upon the railroads thereafter, as the revolutionists, who confined their dynamite attacks to trains carrying troops, had discovered that the Spanish generals now interspersed cars conveying soldiers in the passenger trains. He also threatened to shoot workmen who should be seen reconstructing bridges or repairing telegraph lines. Another proclamation warned planters that their estates would be devastated and their machinery destroyed if they attempted to harvest crops or grind cane without first obtaining a license from the revolutionary Government. Maceo set out to join Gomez in Puerto Principe with supplies of ammunition and with 4,000 infantry and 2,000 cavalry. Their advance guard was attacked by a column of Spanish cavalry under Gen. Aldave at San Nicolas and defeated with heavy loss. Gomez transferred the center of his operations to the vicinity of Sancti Spiritus when Maceo entered Camaguey. The headquarters of the revolutionary Government were near Las Tunas. The Spanish forces in Santa Clara began their campaign early in October, when skirmishes occurred daily, but no action of importance. A passenger car was hit by bombs thrown from ambush, and some citizens and policemen were killed and several soldiers wounded. Roloff had a fight with a Spanish column near Vueltas on Oct. 11. On Oct. 14, Demetrio Castillo, leader of 400 insurgent cavalry, encountering Lieut.-Col. Tejeda and 250 Spanish guerrillas in Sabana de Miranda, feigned a retreat, and by that ruse obtained a victory, killing 31 and wounding 86 of the enemy. Marshal Campos marched with one of his flying columns through the district of Sancti Spiritus, and had some slight skirmishes with the rebels. A Spanish column of 550 men, under Lieut.-Col. Rodon, had a fight on Oct. 26 at Cruz del Yarey, near Jiguani, with some of Rabi's guerrillas, of whom 20 were killed and 60 wounded. A month before Rabi had won a victory over Col. Tovar, ambushing his column of 500 men, and when it was thrown into confusion falling upon it with 250 cavalry, inflicting a loss of 40 men. Rabi burned Baire. He attacked Col. Rodon's column with his cavalry early in November, and drove it back upon Jiguani. The military authorities in the east, especially Gen. Canellas in Guantanamo, adopted harsh measures toward persons suspected of sympathizing with the rebels, and most of the intelligent citizens, who did not join the rebels or escape to Santo Domingo, were thrown into prison. A convoy of 1,300 men, under Col. Tejerizo, was attacked by 500 insurgents with *machetes*, while marching from Manzanillo to Veguita, who cut out wagons containing provisions and 185 Mauser rifles and a quantity of ammunition. On the following day, Nov. 1, Gen. Gonzalez Mufioz attempted to leave Veguita with 2,500 men of all arms. Rabi with 1,300 men, supplied with new arms brought by Gen. Carrillo's expedition, attacked the Spaniards, who repeatedly formed in a square, and, fighting at a disadvantage, finally retreated to Veguita, losing 200 men. On Nov. 15, guerrillas overwhelmed the garrison at the Daiguiri iron mines and killed 214.

Marshal Campos issued a decree forbidding the publication of any news of the war except that officially given by the chief of staff in

Havana. Foreign and Madrid reporters only were permitted to accompany Government forces, and they must comply with all restrictions. Civil and military officials were prohibited from facilitating the sending of war news. Marshal Campos insisted on pursuing a policy of leniency toward the rebels, and was upheld in this by the Spanish Government, though some Spanish politicians called for relentless measures. The Prime Minister announced, however, that the military operations would be vigorously prosecuted, and that there would be no discussion of Cuban reforms until the rebellion was crushed. This declaration drove over to the revolution many Cubans who had been friendly to the Government. A new Cuban loan of 15,000,000 pesos was placed in Paris on Oct. 9. Another Spanish vessel, the gunboat "Antonio Lopez," was wrecked on a key on Oct. 21. Another gunboat, the "Sancosillo," recently purchased in the United States, was captured by a party of rebels in the Cauto river, and stripped of guns and ammunition. Gen. Enrique Collazo got away from Florida in September with a well-equipped expedition of 300 officers and men, and succeeded in landing in Cuba. Gen. Carlos Manuel de Cespedes was also fortunate and landed an expedition on Oct. 27 at La Caleta, near Baracoa. There were 60 men, and they carried with them a large quantity of arms, including a Hotchkiss gun. An expedition fitted out in Canada by Gen. Francisco Carrillo, consisting of 60 men, with 100 rifles and 10,000 rounds of ammunition, also effected a landing in the eastern province. Col. José Maria Aguirre left Canada with another expedition, and reached the Cuban shore, but not without mishap. The party, consisting of 129 men, with 2 rapid-firing guns and 500 Winchesters and 464,000 cartridges, landed on the south coast in Las Villas. The filibusters were surprised while landing in small boats, and some were captured after throwing the arms into the sea. Men and small lots of arms landed incessantly in small sailing craft. The "Laurada," an American steamer suspected of having conveyed one of the expeditions, was seized on the charge of violating the neutrality laws when she returned to Charleston.

On Nov. 12, Gen. Maceo entered Las Villas with 8,000 men from the eastern army and Camaguey. In the meantime, Gomez, with 3,000 men, had advanced westward nearly to Sagua, joining forces with Roloff, Sanchez, Suarez, Cespedes, and Collazo. On Nov. 11, Gen. Oliver's column with the aid of well-planted artillery achieved a victory over the force of Gen. Serafin Sanchez in the Remedios district, killing 60 of the insurgents. José Maceo and Capote detached another force, numbering 3,000 men, from the eastern army, while Gomez organized one of equal strength, recruited in Camaguey, the command of which he gave to José Maria Rodriguez. Before these forces entered Santa Clara the rebel bands of Lacret, Perez, Muñoz, and others terrorized the loyalists of this province and of Matanzas, and did much damage by burning cane fields and houses. Guards protected the principal buildings on the large plantations, while flying columns prevented the rebels from establishing themselves in force upon the plains. The position occupied by Perez and Muñoz at Rincón Hondo, in the Cienfuegos dis-

trict, was captured by Col. Molina. The rebels seldom ventured to attack the small forts with which the country was dotted, but kept the soldiers and the inhabitants in a constant state of alarm by feigning attacks, riding up in the nighttime and firing pistols when challenged. They took one fort close to the city of Santa Clara and menaced the town of Camajuani in the Remedios district. The seat of the revolutionary Government was established at Sabana del Medio. Matanzas, with 500 men, attacked a Spanish column near Cienega Zapatos, in Matanzas, and killed 60 men, with a loss of 25 insurgents. Gen. Serafin Sanchez lost 60 killed in a fight with Gen. Oliver at Manacas Jobos, in the Remedios district, on Nov. 11. The Spanish artillery played an important part in the engagement.

The plan of campaign adopted by Marshal Campos was preliminarily to divide the island into zones, in which flying columns should drive the rebels from point to point, attacking them simultaneously in different places, and ultimately to move forward in an extended line with 25,000 men or more, sweeping them into the mountains of Puerto Principe and Santiago de Cuba. An incipient rising in the Vuelta Abajo was crushed by a constant patrol, and at one time the rebels were driven out of Matanzas; but they reappeared when Gomez concentrated his troops in Santa Clara, and even menaced the towns on the border of the Havana province. Maceo, before he could join Gomez in Las Villas, had to cross a military railroad on the border of Camaguey, which was closely guarded. His advance guard was beaten back by the troops of Gen. Aldave when the first attempt was made. José Maceo, who was following with another large force, at about the same time gained a success over Spanish troops by making good use of some mountain guns. The Spaniards recruited more volunteers in Argentina and in Uruguay and Brazil, who were expected to stand the climate and to be more trustworthy than the soldiers from Spain, some of whom were inclined to mutiny when ordered out to Cuba and to desert to the enemy when they were sent into the field. Late in November 30,000 troops under the command of Gen. Pando and Gen. Marin were sent out from Spain. Marshal Campos intended to concentrate enough troops to surround the combined forces of Gomez, Roloff, and Sanchez and force them to fight a pitched battle. Meanwhile the insurgents won in engagements with detached bodies of Spanish troops in Santa Clara. Antonio Maceo after succeeding in crossing the boundary had a battle with Gen. Navarro near Santa Clara on Nov. 17 which lasted seventeen hours and ended in the defeat of the Spaniards with heavy losses. On Nov. 19 and 20 Gen. Gomez won a similar victory over Gen. Suarez Valdez at Taguasco, near Santa Clara. It was said that this was the heaviest engagement of the war, that the Spaniards lost hundreds in killed and wounded. In an engagement with civil guards near Sagua the rebel chief Rafael Nasferrer was shot, making the fortieth insurgent leader who had been killed since the war began. On Nov. 20 several bands attacked a convoy led by Col. Hernandez on the way to Salto from Sagua. Roloff burned the town of Quinia de Miranda, near Siguanea,

rendering 4,500 people homeless. The Spanish garrison fought well, but was compelled to surrender. The rebels spread panic in the Spanish ranks by throwing dynamite bombs, with which Maceo's army was well provided, and thus he forced his way through the cordons that were drawn to prevent his march through Santa Clara. With the aid of dynamite Gomez captured Fort Pelayo and put its defenders to flight. Lieut. Peláez, the commandant, was afterward tried by court-martial and condemned to imprisonment for life.

President Cisneros and his Cabinet, escorted by José Maceo's army, which was vainly pursued by Mella's troops, transferred their headquarters to Las Villas. A new proclamation of Gomez threatened with death all persons assisting in the gathering of crops and ordered the laying waste of plantations, which was begun as soon as the cane was dry enough to burn. This devastation was checked by the activity of columns led by Gen. Luque and Gen. Oliver. Marshal Campos assigned Lieut.-Gen. Pando to the command of the first army corps, with headquarters in Santiago, and placed Gen. Marin in command of the second corps, operating in Santa Clara, while Gen. Mella remained in command of the forces operating in Camaguey and the division of Puerto Principe, and Gen. Arderius was charged with operations in Matanzas, Havana, and Pinar del Rio. Gen. Bazán and Gen. Salcedo had been removed by Marshal Campos and recalled to Spain on account of their barbarity and their criticism of the mild policy of their superior.

The Alianza Affair.—An American mail steamship, the "Alianza," on the morning of March 8, as she was making the Windward passage off Cape May, was signaled to heave to by the "Conde de Venadito," a Spanish gunboat, which fired two blank shots. According to the account of her officers the merchant vessel was 4 miles, according to the Spanish account 1½ mile from shore. Instead of obeying the signal Capt. James Crossman kept on his course, quickening speed. The Spaniard gave chase at full speed for 25 miles, and as the steamer drew ahead fired 2 or 3 solid shots directly at the American vessel, all of which fell short. The Spanish authorities had been informed that the "Alianza" carried munitions of war in her cargo. These, the ship's officers declared, were delivered in Colombia for the Government of that republic, and they denied the report that they had transferred passengers to fishing boats off the coast of Cuba.

On March 14 Secretary Gresham cabled to the

American minister at Madrid to demand a prompt disavowal of the unlawful act of the commander of the "Conde de Venadito," and a proper expression of regret at its occurrence. He further sent a demand that orders be given to Spanish commanders not to interfere with legitimate American commerce passing through the Windward passage, as this was the usual and natural highway for vessels plying between the ports of the United States and the Caribbean Sea, declaring that forcible interference with them would under no circumstances be tolerated, whether they pass within 3 miles of the Cuban coast or not, when no state of war exists.

The Spanish Government relieved of his command the captain of the "Conde de Venadito," but gave no reply to the representations of the United States Government until a thorough investigation of the circumstances was made by the military authorities and by Señor Dupuy de Lôme, the newly appointed minister to Washington. When their reports were finally received the apology was made.

The Mora Indemnity.—By order of a court-martial Antonio Maximo Mora, a naturalized American citizen, was condemned to death and his estates declared confiscated in 1870 on the charge of participation in the revolution then going on in Cuba, although he was not residing in the island. The United States demanded restitution or indemnification, and in 1873 the Spanish republic admitted the claim was just. The decree was confirmed in 1876 by the royal Government, but the Cuban authorities delayed its execution until the estates were in ruins. Spain finally offered the sum of 1,500,000 pesos as indemnity, and this offer was accepted in 1886. The Cortes, however, made no appropriation for the payment, and in 1888 the Spanish Minister of State attempted to affix to the agreement the new condition, that certain claims of Spanish subjects against the United States should be adjudicated and settled simultaneously. Secretary Bayard rejected the proposition, and the United States Government continued to urge the Spanish Government to fulfill its contract. On June 12, 1895, Secretary Olney instructed Hannis Taylor, United States minister at Madrid, to ask Spain to give assurances that she would satisfy the claim within two months. The Spanish Government then offered to pay the principal of the claim, and the claimant agreed to forego the interest. On Sept. 14, the original claimant having died meanwhile, the Spanish Government paid \$1,449,000, equal to 1,500,000 pesos, in settlement of the long-standing claim.

D

DANA, JAMES DWIGHT, an American geologist, born in Utica, N. Y., Feb. 13, 1813; died in New Haven, Conn., April 14, 1895. His father, James Dana, was a successful business man, and his mother was Harriet, daughter of Seth Dwight, of Williamsburg, Mass. The boy early showed a fondness for science, and at the age of twelve, while a student in Bartlett Acad-

emy, in Utica, studied chemistry and shared with his associates the responsibility of preparing the experiments and delivering to others the formal lectures; also making frequent excursions after minerals. In 1830, attracted by the reputation of the elder Silliman, he entered Yale College as a sophomore. During his college course he made much progress in science, especially in botany

and in mineralogy; also attaining distinction in mathematics. In August, 1833, he left New Haven, having been appointed instructor of mathematics to midshipmen in the United States navy, and in this capacity visited many ports of France, Italy, Greece, and Turkey while on the "Delaware" and the "United States." Notwithstanding his duties he found time to make

JAMES DWIGHT DANA.

collections in natural history, and his first paper, "On the Condition of Vesuvius in July, 1834," appeared in the "American Journal of Science" in 1835. He returned to New Haven in 1836, and for two years served as assistant in chemistry to Prof. Silliman. During these years he prepared his "System of Mineralogy" (New Haven, 1837). Again he was called to leave New Haven, for he received the appointment of mineralogist and geologist to the United States exploring expedition under Capt. Charles Wilkes in 1838. This place he refused at first, but on the earnest solicitation of Dr. Asa Gray, who had been appointed botanist, he was persuaded to accept. The expedition sailed in August, 1838, and returned in June 1842, having circumnavigated the globe. In addition to the mineralogy and geology he assumed charge of the zoology, including the crustacea and corals. For thirteen years after his return he was occupied in the study of the collections made by him, and his results were published as a "Report on Zoöphytes" (4to, with an atlas of 61 folio plates, Philadelphia, 1846), in which he proposed a new classification and described 230 new species; a "Report on the Geology of the Pacific" (4to, with an atlas of 21 plates, 1849); and a "Report on Crustacea" (2 parts, 4to, with an atlas of 96 folio plates, New York, 1852-54). Most of the plates in these works were drawn by his own hand. Meanwhile he prepared the editions of his "System of Mineralogy" that were published in 1844, 1850, and 1854, and also the editions of his "Manual of Mineralogy" that were published in 1848 and 1857.

In 1850 he was appointed Silliman Professor of Natural History and Geology in Yale College, although he did not assume the active duties of the chair until 1855. The title of his professorship was changed in 1864, owing to the delivery of the lectures on natural history by others, to that of Geology and Mineralogy, and he main-

tained his active connection with Yale until 1860. Prof. Dana became associated with the two Sillimans in the editorship of the "American Journal of Science" in 1846, and later became senior editor, which post he held until his death. The fifth edition of his "System of Mineralogy" (1868) was the last that he himself wrote, but the editions of the smaller "Manual of Mineralogy" in 1878 and 1897 were by him. In 1862 the first edition of his "Manual of Geology" was issued, and in 1895 the fourth was published, all of which he edited. Besides the foregoing he was the author of "Coral Reefs and Islands" (New York, 1853), which he enlarged and issued as "Corals and Coral Islands" (1872; 2d ed., 1890); "Text-book of Geology" (1864; 2d ed., 1874); "The Geological Story briefly told" (1875); "Characteristics of Volcanoes" (1890); and "The Four Rocks of the New Haven Region" (New Haven, 1891). The degree of Ph. D. was conferred upon him by the University of Munich in 1872, and that of LL. D. was given him by Amherst in 1853, and by Harvard and Edinburgh in 1886. In 1872 the Geological Society of London sent him its Wollaston medal, and in 1877 he received the Copley medal of the Royal Society of London, while in 1892 the Boston Society of Natural History conferred upon him their "Grand Walker prize of \$1,000 for distinguished services in Natural History." In 1854 he was elected President of the American Association for the Advancement of Science, and he was one of the original members of the National Academy of Sciences. He held honorary and corresponding relations to many scientific societies both at home and abroad, including the Royal Society of London, the Institute of France, the Lincei of Rome, and the Royal Academies of Berlin, St. Petersburg, and Vienna. Prof. Dana left his diplomas from scientific societies and academies, and also his medals, to be delivered to Yale University at the option of the widow, who was Henrietta Frances, third daughter of Prof. Silliman. He provided in his will that the diplomas be made a part of the general collection of scientific documents and the medals are to be added to the general collection of medals in the university library. He also gives from his own library the works on geology that are not already on the shelves of the college library, excepting such volumes as, if taken away, would break a series. A sketch of his life, accompanied by a full bibliography of his numerous papers, written by his son, Edward Salisbury Dana, appeared in the "American Journal of Sciences" for May, 1895.

DELAWARE, a Middle Atlantic State, one of the original thirteen; ratified the Federal Constitution Dec. 7, 1787; area, 2,120 square miles. The population, according to each decennial census, was 39,066 in 1790; 64,273 in 1800; 72,674 in 1810; 72,749 in 1820; 76,748 in 1830; 78,085 in 1840; 91,532 in 1850; 112,216 in 1860; 125,015 in 1870; 146,608 in 1880; and 168,493 in 1890. Capital, Dover.

Government.—The State officers during the year were the following: Governor, Joshua H. Marvil, Republican, until his death, April 8, when he was succeeded by the Speaker of the Senate, William T. Watson, Democrat; Secre-

tary of State, N. B. Smithers, succeeded by J. H. Whiteman; Attorney-General, John R. Nicholson; Treasurer, Charles H. Atkins; Auditor, R. L. Lewis; Superintendents of Education, H. D. Griffin, Caleb C. Tindal, and P. Zameny; Adjutant General, Samuel A. Macallister, until May, when he resigned, and was succeeded by Garrett J. Hart; Chancellor, James L. Wolcott; Chief Justice, Charles B. Lore; Associate Justices, Ignatius C. Grubb, Charles M. Cullen, and David T. Marvel.

Finances.—The statement of the Treasurer at the beginning of the year shows that the assets of the State amounted to \$1,031,842, and the liabilities to \$684,750; thus the assets exceeded the liabilities by \$347,092. Of the \$70,772 paid to Delaware as its due in the repayment of the direct tax, \$59,995.24 has been distributed, leaving the State over \$10,000, which more than covers the cost of distribution.

The Treasurer says: "During my incumbency of this office the expenditures have largely increased both from regular and special appropriations. The latter aggregated over \$87,000. To the regular appropriations have been added registration expenses, aggregating \$15,000, and expenses connected with the Delaware State Hospital at Farnhurst, aggregating, including special appropriation for improvement fund, \$155,000. The result of the payment of these large sums of money has been to deplete the general fund to an extent that makes it absolutely necessary for our revenue to be increased. I have been enabled to meet the demands made upon the general fund during the past two years by borrowing from the school fund."

Banks.—The report of the national banks of the State in March showed the total resources to be \$8,724,652.29, and the surplus fund \$978,900.

Insurance.—During 1893, 98 insurance companies were authorized to do business in the State—52 fire, 22 life, 6 assessment, 12 casualty and guarantee, and 6 accident insurance companies. Last year 108 companies were authorized—58 fire, 22 life, 8 assessment, 12 casualty and guarantee, 6 accident, and 2 live-stock insurance companies. Five of the companies are incorporated by the State. Four of them pay an annual tax of \$100, and one company is exempt from taxation. Since the preceding biennial report 14 companies have been admitted to do business in the State. During 1894 the companies incorporated by the State collected premiums in the State amounting to \$59,995.19, and incurred losses amounting to \$33,627.37, and the companies of other States and foreign countries received premiums amounting to \$309,099.86, and incurred losses amounting to \$181,008.53, showing the total premiums received for the year to have been \$299,164.87, and total losses incurred \$214,666.90.

State Institutions.—An addition to the State Insane Asylum is to be built, and to raise funds for the purpose \$35,000 worth of bonds has been issued, which were sold at \$104.48. They bear 3½ per cent. interest, are payable in twenty years, and redeemable at the option of the State any time after Jan. 1, 1906. The plans call for the erection of 3 three-story buildings.

The total number of inmates at the hospital

in February was 226, of whom 98 were women. In July there were 243 inmates. During the previous year 90 were discharged, of whom 50 had recovered and 21 improved. The average annual cost of support is \$138 for each patient.

The following statements in regard to the prison system and discipline of the State were made in an address to the Legislature by the Chief Justice in advocacy of a bill to provide for a State workhouse:

At present in the jails of the 3 counties of this State there are 210 prisoners, of all ages, color, sex, and grades and experience in crime, crowded together in about 50 cells, living in idleness, festering under vicious habits, and becoming daily more hardened from such environments. We stand almost alone of the 44 States of the Union in keeping up a prison system that originated in the centuries long ago and has not changed for over two hundred years. . . .

The bill proposes to borrow \$200,000 on the State's credit, and provides for the Board of Trustees of Delaware State Workhouse, to be composed of 3 members from each county, who, without pay for services, are to expend the \$200,000 provided by the bill in erecting a State workhouse. In this house all prisoners of the State shall be put to work under the direction of the board. The prisoners are to be classified and separated—the men from the women, and those of tender years and new in crime from old and hardened criminals. Obedience to the rules and diligence in work will inure to the benefit of the prisoner by shortening his term.

Education.—Delaware College, at Newark, reported 78 students for the year, and 14 graduates. The Inspector General, who reviewed the cadets, commended their appearance, and said: "It is my opinion that the improved aspect and relations of the military department of this institution amply warrant its continuance." The by-laws were so changed as to require all students receiving free tuition to take military drill during the freshman, sophomore, and junior classes, unless excused on account of physical disability or religious objection.

The State Principals' Association and the State Board of Education have been working for such additions to the school laws as will insure a substantially uniform curriculum in the schools of the State; it is also a part of their plan to have central high schools established in the rural districts.

At the Educational Convention of colored Citizens of the State, in Dover, Feb. 7, it was said that there are about 6,000 colored children of school age in the State that never have seen the inside of a schoolhouse. The chairman of the Committee on Resolutions spoke of the wretched condition of the schools in the counties; of the dilapidated buildings, many almost unfit for school purposes, the remainder being churches or halls; of the short terms; of the meager salaries paid to teachers; of the almost total lack of school appliances and facilities; of the alarming extent of illiteracy in the State. He called attention to the fact that during the past decade illiteracy among the colored people of this State had decreased proportionately less than in any other State of the Union similarly conditioned.

Water Ways.—The appropriation made by the Government for dredging and deepening the harbor at Wilmington, including the lower part of the river, has been expended, and a survey has been made by United States Engineer W.

P. Smith of the entire river and its tributaries with a view to dredging the channel to a uniform depth of 21 feet from the Delaware river to the Delaware Pulp Works. The present depth is about 15 feet. From 1836 to 1892 the Government expended about \$350,000 in appropriations for improvement of the harbor.

The report of the commission appointed by Congress to examine the surveys for a canal to connect Chesapeake and Delaware Bays discussed the various proposed routes and recommended as the most feasible the Back creek route, which is substantially located on the line of the existing Chesapeake and Delaware Canal. This route, it believes, could be constructed at much less cost than any of the others suggested, is better adapted for national defense, and will give greatest facility to commerce.

The Cubans.—Twenty men accused of being intending filibusters were arrested at Penn's Grove, Aug. 30, by Federal officers from Wilmington, who also captured 28 cases of arms and ammunition and a large quantity of baggage. The party had chartered a tug and sailed from Wilmington, but when they found themselves pursued by the officers in another tug they landed at Penn's Grove. Two of the party escaped capture. All are Cubans by birth, but citizens of this country by adoption. They were tried in the United States court at Wilmington and acquitted, and the verdict was received with demonstrations of popular approval.

License.—A convention of those in favor of local option was held in Dover, Jan. 10, for the purpose of deciding upon a bill to be presented to the Legislature. In July the State Liquor League was organized at a meeting in Wilmington. Resolutions were adopted declaring the organization to be

constructed upon the broad plane of personal liberty and equality of rights; ready at all times to support law and order; interfering with no trade or profession, but always ready to extend a helping hand for the prosperity of State and country and to all classes of business. We believe that our Creator endowed man with the unalterable right to eat and drink whenever his appetite requires, so that it does not interfere with his peace and happiness. The business in which we are engaged has existed for centuries. It is recognized in every civilized land. It can be defended from every standpoint known to reason or argument, yet we are faced by an organized body of people whose power we must not underestimate.

The resolutions further pledged the league to obey the present laws and exert itself to have them "modified to meet the present state of society and the trade generally."

Antibribery Convention.—After the elections of 1894 it was charged that a great deal of money had been used and that the registration and ballot laws had been grossly violated. The corruption fund in Sussex County was said to have been about \$60,000. The system of voting is a modification of the Australian ballot law, but it was said that the workers in many places accompanied the voters into the booths to make sure that they voted according to the contract; that in one hundred, or township, the voting took place in a dwelling house and that no poll list was used; and that in some of the hundreds negroes were made to stand up and take oath that they would vote as they had promised and

been paid to do. At the first term of court in 1895, 2 men, one a Republican and the other a Democrat, were convicted of violation of the election laws; 7 other cases of the kind were set aside because the indictments were defective. In view of these facts the State Grange called an antibribery convention to meet at Dover, Feb. 22. It was not largely attended, but resolutions were passed calling for strict laws to prevent corruption, and a plan was adopted for an organization to be called "The Political Reform League of Delaware."

In his message to the Legislature in January, Gov. Reynolds said on this subject:

You yourselves, no doubt, are aware that this vice has grown to its present magnitude not so much on account of the lack of proper legislation as of a too tolerant public sentiment. General Assemblies prior to this have recognized its danger and enacted laws intended for its suppression, but their efforts were rendered futile because of the indifference of the people, who had not up to the recent election been awakened to a sense of the enormity of this crime. For example, the Legislature of 1891 adopted the Australian system of voting, then considered to be the most effectual method of securing a pure and free ballot, but its provisions have been virtually nullified by the culpable failure of the people to carry them into effect.

Legislative Session.—The Legislature met in January, with 19 Republicans and 11 Democrats. The election of a United States Senator in place of Anthony Higgins, whose term had expired, was one of its duties; but after four months, during which more than 130 ballots were taken, the Legislature adjourned May 9, leaving the matter still unsettled. The Republican majority could not agree upon a candidate. Six of them voted steadily for J. E. Addicks until near the close of the session, when the number of his supporters was reduced to 4. Ex-Senator Higgins was his principal opponent in the early part of the session; later, George V. Massey, James Pennewill, and Henry A. Du Pont. Others named by Republicans on some of the ballots were Hiram R. Burton, Benjamin Nields, E. G. Bradford, Charles F. Richards, H. A. Richardson, and William Du Pont. The first choice of the Democrats was Chancellor James L. Wolcott. Others who received support were John R. Nicholson, Ebe W. Tunnell, Thomas F. Bayard, John W. Causey, and E. L. Martin. Chancellor Wolcott withdrew his name March 7, and thereafter Edward Ridgely received the support of the majority of the Democrats. After the death of Gov. Marvell, the Speaker of the Senate, William T. Watson, became acting Governor according to the Constitution, as Delaware has no lieutenant governor. The Constitution does not say whether the Speaker vacates the office of Senator by assuming that of Governor, and on May 9, the last day of the session, Gov. Watson resumed his position as president of the Senate and claimed his right to vote. Without him there were 29 votes and only 15 would be needed for a majority, and as 15 of the Republicans were now united upon Henry A. Du Pont, the Speaker of the House declared that he was elected. Including the Governor, however, there were 30 votes, and 16 were required for a majority, and the Governor and the Speaker of the Senate declared that no choice had been

made. So the session closed with the question still in doubt. There is a precedent bearing on the point in the history of the State. The Constitution of Delaware is substantially the old Constitution framed in 1791, but it was revised in 1832 and bears that date. The president of the Constitutional Convention of 1832 was Speaker of the Senate when Gov. Bennett died in office in 1836. He became acting Governor. The fact that no Senator was elected in his place at the general election held while he was so acting and before his term expired, and that he returned and resumed his seat as Senator after the inauguration of the next Governor, seems to show that, in the opinion of those who revised the Constitution, he did not lose his seat by assuming the duties of Governor, and his right was not called in question even by political opponents. At the same time it does not appear that he exercised or attempted to exercise the functions of Senator while acting as Governor, and so the parallel is not complete.

It is claimed that if Mr. Watson did not have the rights of a Senator his constituents were deprived of their just representation in the choice of United States Senator, since no successor had been elected to his seat.

The vote taken at the election of 1894 on the question of holding a constitutional convention having shown a majority in its favor, the Legislature provided for such convention, to be held in 1896.

A joint resolution was passed requiring the Attorney-General to investigate the title to certain historical and legal papers, especially a deed of feoffment of the Duke of York to William Penn, which were advertised to be sold in Philadelphia as private property, and to ascertain whether the State were entitled to the possession of those papers. He reported that, in his judgment, the State had a lawful claim, and he was directed to institute such proceedings as should be necessary to protect the rights of the State.

An act was passed authorizing alterations and additions to the State Capitol.

Another act was for the suppression of betting and wagering upon contests of skill or speed. The penalty was fixed at a fine of not less than \$100 nor more than \$2,000, and in default of payment imprisonment of not less than three months nor more than two years.

Many other bills of importance were introduced and some passed. Of the condition in which they were left the Dover "Index" said: "By the manner of its [the Legislature's] dissolution our laws have been left in a state of confusion and uncertainty hardly to be appreciated by the citizens at large."

DENMARK, a kingdom in northern Europe. The legislative body, called the Rigsdag, is composed of the Landsthing and the Folkething, the former consisting of 66 members, of whom 12 are life members nominated by the Crown and the rest are elected by indirect suffrage for eight years, the latter of 114 members, in the proportion of 1 to 16,000 inhabitants, elected by direct universal manhood suffrage. A new electoral law has created 12 new districts.

The reigning sovereign is Christian IX, born April 8, 1818, a prince of the house of Schleswig-Holstein-Sonderburg-Glücksburg, which is a

younger branch of the house of Oldenburg that ruled Denmark for four centuries and became extinct by the death of Frederik VII., Nov. 15, 1863, whom Christian succeeded, having been named heir to the throne in the treaty of London, signed May 8, 1852.

The State Council is composed of the following ministers: President of the Council and Minister of Finance, Baron K. T. T. O. Reedtz-Thott, appointed Aug. 7, 1894; Minister of the Interior, H. E. Hörring; Minister of Justice and Minister for Iceland, J. M. V. Nellesmann; Minister of Finance, C. D. Lüttichau; Minister of War, Gen. C. A. F. Thomsen; Minister of Marine, Vice-Admiral N. F. Ravn; Minister of Worship and Public Instruction, W. de Bardenfleth; Minister of Public Works, H. P. Ingerslev.

Area and Population.—The area of Denmark, including the Färøe Isles, is 15,289 square miles. The population in 1890, when the last decennial census was taken, was 2,185,335, consisting of 1,059,322 males and 1,112,983 females. The number of marriages in 1893 was 15,739; of births, 70,280; of deaths, 42,295; excess of births, 26,235. The number of emigrants was 9,150. Copenhagen, the capital, had 312,859 inhabitants in 1890; with its suburbs, 375,251.

Finances.—The revenue for the year ending March 31, 1894, was 58,075,266 kroner (1 krone = 27 cents), and the expenditure 62,152,474 kroner. The budget for 1896 makes the revenue 62,743,929 kroner, of which 39,085,000 kroner are derived from customs and other indirect taxes, 9,971,100 kroner from direct taxes, 6,663,145 kroner from receipts from property and the sinking fund, 4,571,570 kroner net from the railroads, posts, and telegraphs, 1,034,000 kroner from lotteries, 791,524 kroner from domains and forests, and 627,599 kroner from all other sources. The total expenditures are estimated at 61,767,435 kroner, of which 10,239,755 kroner are devoted to the Ministry of War, 10,036,342 kroner to the improvement of state property and reduction of debt, 6,820,065 kroner to the Ministry of Marine, 6,654,250 kroner to interest and expenses of the debt, 5,714,111 kroner to the Ministry of Marine, 3,979,008 kroner to the Ministry of Justice, 3,909,298 kroner to the Ministry of Public Worship and Instruction, 3,840,878 kroner to the Ministry of Finance, 3,235,407 kroner to pensions and military invalids, 1,155,200 kroner to the civil list and appanages, 733,811 kroner to the Ministry of Public Works, 585,456 kroner to the Ministry of Foreign Affairs, 319,016 kroner to the Rigsdag and Council of State, 85,764 kroner to Iceland, and 4,459,074 kroner to extraordinary purposes.

The public debt on March 31, 1894, amounted to 182,108,483 kroner, mostly bearing $3\frac{1}{2}$ per cent. interest. The foreign debt was only 9,554,183 kroner. The reserve fund kept for extraordinary emergencies amounted on March 31, 1894, to 34,754,796 kroner. The investments of the state amounted to 50,976,260 kroner, not including the state railroads, which are valued at 185,975,410 kroner.

The Army.—The military forces of Denmark in 1895 consisted of 31 battalions of infantry, besides 11 of reserves; 5 regiments of cavalry, each having its depot; 2 regiments of field artillery, each having 6 active and 2 reserve batteries; 2

battalions of fortress artillery, divided into 6 companies, besides 5 companies of reserves; and 1 regiment of engineers. The peace effective was 778 officers and 13,152 men in 1894; the war strength was 1,214 officers and 42,919 men. The infantry weapon is the Krag-Jørgensen rifle of 8 millimetres caliber. Each battery of artillery has 5 steel cannons of 9 centimetres caliber.

The Navy.—The naval force consists of 1 armored battle ship of the second class, the "Helgoland," protected by 12-inch plates and armed with 1 36-ton, 4 22-ton, and 6 small and quick-firing guns; 3 first-class armored cruisers, one carrying a single 32-ton and the others a couple of 28-ton guns; 4 old ironclads for port defense; 6 new deck-protected cruisers; 14 third-class cruisers; and 6 first-class, 4 second-class, and 2 third-class torpedo boats. The budget for 1896 provides for a new armor-clad and 1 first-class torpedo boat.

Commerce.—The value of the imports in 1893 was 320,394,907 kroner; of the exports, 235,115,967 kroner. The values, in kroner, of the principal classes of imports and exports were as follow:

CLASSES OF ARTICLES.	Imports.	Exports.
Butter, eggs, lard, and pork.....	81,071,599	141,089,676
Textile manufactures.....	48,062,981	5,181,212
Cornstarch.....	33,684,870	8,652,843
Cereals.....	29,441,400	12,949,089
Metal goods.....	31,981,819	5,161,906
Coal.....	21,661,184	2,000,003
Animals.....	1,624,875	21,833,760
Wood and manufactures.....	16,284,598	3,293,351
Drinks.....	4,457,380	1,915,755

The trade, in kroner, with the principal foreign countries in 1893 was as follows:

COUNTRIES.	Imports.	Exports.
Great Britain.....	69,004,019	144,094,682
Germany.....	110,443,439	47,319,655
Sweden and Norway.....	48,874,277	27,085,598
Denmark.....	27,465,373	2,904,484
United States.....	29,198,953	1,884,878
Netherlands.....	8,546,075	284,280
Prussia.....	9,268,997	1,249,486
Belgium.....	5,479,645	924,464
Danish Colonies.....	3,867,879	4,061,192
Spanish America.....	822,087	18,002

Navigation.—The number of vessels entered at Danish ports in 1893 was 27,203, with 2,049,854 tons of cargo; the number cleared was 27,205, carrying 582,819 tons of cargo.

The merchant marine on Dec. 31, 1893, consisted of 3,675 vessels, of 330,911 tons, of which 874, of 129,209 tons, were steam vessels.

Communications.—There were 1,292 miles of railroad in 1894. Of these, 999 miles were Government property, in which 185,975,410 kroner were invested.

The telegraphs had a length of 3,674 miles, with 10,280 miles of wire. The state owned 2,910 miles of lines.

Iceland.—This dependency of Denmark has its own Constitution. The legislative power is exercised by the King, through a nominated Governor, and the Althing. The Althing is composed of two Chambers, one of which has 12 members, half of them appointees of the Crown and half elected by the other Chamber. This is the popular branch and contains 36 members, of

whom 30 are elected by the people and 6 are nominated by the King. The area is 39,756 square miles, of which 16,180 are inhabited. The population is 70,927. The value of the imports in 1893 was 2,593,992 kroner; of the exports, 2,777,405 kroner.

Greenland.—The Danish colony on the east coast of Greenland has an estimated area of 46,740 square miles and a population of 10,516 souls. The imports in 1893 were 619,161 kroner and the exports 195,511 kroner in value.

(For the Danish Antilles, see WEST INDIES.)

General Election.—The rise of the Agrarian party altered the conditions of electoral contests considerably. To gain the support of the Agrarians the Government arranged with the banks for a general reduction of the rate of interest on mortgage loans from 4 to 3½ per cent., intermitting for the purpose negotiations that were in progress for the conversion of the public debt. The Folkething voted to guarantee the bonds of the credit institutions, a proposition that ex-Premier Estrup considered dangerous and communistic.

The elections for the Folkething were held on April 9 and resulted in a majority of Socialist-Radicals. The people thus recorded a protest against the compromise arranged between the Folkething and the Conservative ministry and Landsting in April, 1894. The new Folkething, consisting of 61 Radicals, 29 Moderate Liberals, and 24 members of the Right, met on April 19 to elect its officers. Sophus Hoegsbro, the President, and the two Vice-Presidents chosen were opponents of the compromise.

DISASTERS IN 1895. In Europe and America the year opened with unprecedented cold, with storms so violent and protracted that untold suffering and loss of life and property followed. Of the more notable disasters, the loss at sea of the Elbe and the Reine Regente are the most conspicuous, involving the almost instant loss altogether of 755 lives. A larger number than usual of minor accidents is recorded, those occurring on railways being especially numerous. The list of these last is condensed from the full monthly reports of the "Railway Gazette"; the summaries of losses by fire are from the returns published by the "Journal of Commerce and Commercial Bulletin," of New York.

January 1. Trains wrecked near Yorktown, Ind., and Olequa, Wash., 3 killed, 4 hurt.

2. Train wrecked near Bainbridge, Ohio, 1 killed, 4 hurt.

4. Shipwrecks in a disastrous storm in British waters, about 900 seamen perished. Train wrecked, Livermore, Cal., 3 killed, causing conflicting orders.

5. Avalanche in the French Pyrenees, town of Orlu nearly demolished, 15 killed. Trains wrecked, White Haven, Pa., and Middlebury, Pa., 3 killed, 1 hurt.

6. Fire in Toronto, Ontario (see end of January). Explosion and fire on a steamer in the harbor of Rio, Brazil, 120 lost.

7. Train wrecked near Smithville, Ohio, 2 killed, 2 hurt.

8. Fire! Decatur, Texas, county courthouse and records burned, loss, \$43,000.

10. Train wrecked, Brooklyn, N. Y., 1 killed, 1 hurt. Second fire in Toronto (see end of January).

11. Widespread blizzard in the West and Northwest, much suffering and death from cold and exposure. Train wrecked near Kansas City, Mo., 1 killed, 1 hurt.

12. Train derailed near Middlebury, Pa., engineer killed.

13. Train wrecked near Milligan, Ind., 1 killed. Fires: Bradford, Pa., loss, \$150,000; Barnesville, Ohio, loss, \$100,000.

14. Floods in Pennsylvania, estimated loss, \$500,000. Train wrecked near Noland, New Mexico, 1 killed, 1 hurt.

15. Train falls through an open drawbridge near Boston, Mass., 1 drowned.

16. Explosion and fire at Butte, Mont., 53 killed, 100 hurt, estimated loss of property, \$1,000,000. Train wrecked near White Plains, Nev., 1 killed, 2 hurt, probably the result of malice.

17. Fire in Macon, Ga. (see end of January).

18. Destructive avalanches in Switzerland.

19. Steamboat sinks in the Ohio river, 12 lives lost. Earthquake in Persia: city of Kuchan partly destroyed, with large loss of life.

20. Trains wrecked near Carmen's Interchange and Duchesne Run, in Pennsylvania, 3 killed, 3 hurt.

21. Shipwreck: steamer Chicora sinks in Lake Michigan, 37 lost. Famine threatened in St. John's, Newfoundland.

22. Intense cold in the North western United States. Train wrecked near Iita Bena, Miss., 1 killed, 2 hurt.

23-29. Trains wrecked near Salisbury, N. C., 1 killed, 2 hurt; Coatesville, Ind., 2 killed, 27 hurt; Brainard, Minn., 1 killed.

30. Shipwreck: North German Lloyd steamer Elbe sunk by collision in the North Sea by British steamer Cralthie, lost 335, saved 22. Train wrecked near Olathe, Kan., cars take fire, 2 tramps killed.

31. Train wrecked near North Judson, Ind., 1 killed, 2 hurt. Fire: Holmes College burned, Jackson, Miss., loss, \$25,000.

Fires in January: Anna, Ill., State insane asylum burned, loss, \$350,000; Springfield, Ohio, dwellings, \$200,000; Toronto, Ontario, business blocks, \$1,500,000; Macon, Ga., business block, \$715,000; Brooklyn, N. Y., fur-cutter's house, \$240,000; Hazleton, Pa., coal works, \$200,000; and 210 others; aggregate loss, \$11,875,600.

Summary of train accidents for January: 55 collisions, 67 derailments, 7 others; total, 129. Killed: 23 employees, 4 passengers, 5 others; total, 32. Hurt: 54 employees, 45 passengers, 1 other; total 100.

February 1. Fire: Cleveland, Ohio, Deaconess Hospital burned, 4 lives lost.

2. Train wrecked, Woodell, Pa., 1 killed, 3 hurt. Building falls in Dortmund, Germany, 80 killed.

3. Fire: Rochester, Pa., glass works burned, loss, \$150,000.

4. Explosion: fire damp in a French colliery, about 40 killed.

5. Fire: Lima, Ohio, business houses and theaters burned, loss, \$100,000.

6-12. Intense and unprecedented cold in the United States east of the Rocky Mountains and over a large part of western Europe; storms of great violence prevailed; the temperature ranging from 12° above zero in Florida to 60° below zero in Canada; widespread suffering, destitution, and death.

7. Train wrecked near Purvis, Miss., 3 tramps killed. Fires: Evansville, Ind., loss, \$100,000; Jackson, Miss., Bolhaven College burned, loss, \$50,000; Indianapolis, loss, \$100,000.

8. Fire: Fishkill Landing, N. Y., loss, \$100,000.

9. Fires at St. Joseph, Mo. (see end of February), and Harrisburg, Pa., State printing house burned, loss, \$100,000. Train wrecked near Verona, N. Y., 1 killed.

10. Terrible storm in Ireland. coldest weather known for forty years. Train wrecked near Grundy City, Iowa, 1 killed, 3 hurt.

11. Many deaths from cold and exposure reported in Great Britain. Train wrecked near Dover, N. H., 2 killed, 13 hurt.

12. Fire: Mount Holly, N. J., hotel burned, loss, \$150,000.

13. Fire: Lynn, Mass., loss, \$100,000.

14. Heavy snow in Texas and the Southwestern States, many of the large herds of cattle lose 25 per cent. of their number by exposure. Cholera epidemic in Constantinople.

15. Train wrecked near Rhinecliff, N. Y., 1 killed, 1 hurt.

17. Trains wrecked in Kansas and Oklahoma, several lives lost and many injured.

18. Famine in East Africa, caused by ravages of locusts. Fire: Buffalo, N. Y., Music Hall burned, loss, \$300,000.

19. Train wrecked near Credo, W. Va., 1 killed, 2 hurt. Skating accident, 30 students drowned near Moscow. Gun bursts at the Sandy Hook proving grounds, Lieut. F. C. Peck killed.

20. Explosion: powder magazine in Formosa blows up, about 2,000 Chinese soldiers killed. Fire: Hamilton, N. Y., loss, \$238,000.

23-24. Trains wrecked near Greenville, Ala., 1 killed, 7 hurt; and Malone, N. Y., 1 killed, 4 hurt.

27. Explosion in a coal mine near Cerrillos, New Mexico, 25 killed.

28. Train wrecked near the city of Mexico, 75 killed, many hurt.

Fires in February: Monaca, Pennsylvania, glass works, loss, \$150,000; Cincinnati, Ohio, tobacco house, \$300,000; St. Joseph, Mo., railroad station, \$300,000; Mount Holly, N. J., hotel, \$150,000; Paterson, N. J., silk mills, \$300,000; Hamilton, N. Y., sundry buildings, \$240,000; Brooklyn, N. Y., coffee mills, \$250,000; Minneapolis, warehouses, \$160,000; Chicago business houses, \$280,000; Halifax, Nova Scotia, warehouses, etc., \$600,000; Kingston, N. C., sundry buildings, \$225,000. Total number of fires, 216. Aggregate loss, \$12,360,200.

Summary: Train accidents in February, 43 collisions, 92 derailments, 8 others; total, 143. Killed: 13 employees, 2 passengers, 3 others; total, 18. Hurt: 75 employees, 44 passengers; total, 119.

March 1. Buildings fall in New York, 5 killed, 19 hurt. Train derailed near Bayonne, N. J., a second train in collision with the wreck, 2 killed, 3 hurt. Fire: lumber yards burned, Ottawa, Canada, loss, \$100,000.

2. Locomotive boiler explodes, Weems, Ala., train wrecked, 2 killed.

3. Third fire in Toronto, Ontario (see end of March).

4. Train derailed by malice, Ozark, Ark., 1 killed.

5. Train derailed, Beaufort, Tenn., 1 killed. Trains derailed and in collision near Scotland, Ga., 2 killed, 2 hurt. Locomotive boiler explodes near Cove, Pa., mail and baggage cars derailed, 2 killed, 1 hurt.

10. Train derailed by fallen rocks near Newton, Pa., 1 killed.

11. Shipwreck: Spanish man-of-war Reine Regente sinks off Cape Finisterre, all hands lost, 420 men. Locomotive machinery breaks near Dykes, N. Y., 1 killed, 1 hurt. Train derailed near Dickenson, Texas, 1 killed, 1 hurt.

12. Trains in collision, Elvins, Mo., 1 killed, 2 hurt.

13. Fire: workshop of Nicola Tesla, the famous electrician, burned, in New York. Train derailed by washout near Troy, Ala., 2 killed, 3 hurt; another near Allegheny City, Pa., 1 killed, 1 hurt.

14. Destructive hurricane in the Fiji Islands.

16. Explosion: fire damp in Australian coal mines, 50 lives lost.

16. Train derailed, Oakwoods, Texas, 1 killed, 2 hurt.

17. Fire: roundhouse burned, Toledo, Ohio, 3 killed, 9 hurt. Train derailed near Natural Tunnel, Va., 2 fatally hurt.

18. Passenger car on 2-foot narrow-gauge railroad overturned by wind near Strong, Me.

20. Tornado in northern Georgia, much damage results. Explosion: dynamite in transit on the river Rhine, 25 killed. Trains in collision near Hineckley, Ill., 2 killed.

21. Explosion in mine near Evanston, Wyo., 60 killed.

24. Hotel burned in Denver, 4 firemen killed. Disastrous gale in Great Britain, many lives lost.

25. Fire in Milwaukee (see end of March).

26. Train falls through trestle near Portsmouth, Ohio, 18 cars in the wreck, one of them, loaded with matches, becomes ignited and all are burned.

27. Train derailed near Newcomerstown, Ohio, 4 tramps badly hurt.

Fires in March: Toronto, Ontario, business houses burned, loss, \$1,140,000; Bethalto, Ill., flour mill, \$300,000; Kansas City, Mo., machinery, \$340,000; Burlington, Vt., factory, \$250,000; Sioux City, Iowa, warehouses, \$400,000; New Orleans, cotton press, \$100,000; Kansas City, Mo., packing house, \$700,000; Milwaukee, Wis., business blocks, \$500,000; Chicago, clothing stores, \$235,000; St. Augustine, Fla., buildings, churches, etc., \$300,000; and 219 others; aggregate loss, \$14,259,000.

Summary of train accidents in March: 36 collisions, 43 derailments, 9 miscellaneous; total, 126. Killed: 43 employees, 2 passengers; total, 33. Hurt: 61 employees, 19 passengers; total, 80.

April 1. Train derailed near Elmira, N. Y., 1 killed.

2. Train wrecked near Pocatello, Ida., 9 hurt (the railroad company settled with many of the injured by paying damages as high as \$100 on the spot).

3. Train wrecked near Alton, Ill., about 75 tramps on board, 4 killed, 15 hurt. Near Whigville, Ohio, a train derailed on a trestle falls 50 feet, 4 killed, 3 hurt.

4. Train wrecked near Canimal, Pa., 1 killed, 5 hurt.

5. Train derailed near New Castle, Wyo., 1 man killed by a bent rail thrusting itself through the engine.

6. Landslide near Marion, N. C., wrecks a train, 2 killed.

7. Disastrous floods in New England and the Middle States. Punatawney, Pa., a washout wrecks 16 cars and kills 2 men; another near Germin, in the same State, kills 1. Explosion: Blue Canyon Mine, Wash., 20 killed. Building falls, Wheeling, W. Va., 4 killed, 4 hurt.

8. Explosion at Shanghai, China, 40 soldiers killed.

9. Train wrecked, probably through malice, near Abbe, Tenn., 3 hurt.

10. Earthquake in Austria and northern Italy, several lives lost.

11-21. Trains wrecked near Dayton, Ohio, 1 killed, 1 hurt; Stevens, Va., 1 killed; Garfield, Wash., and

22. Elmo, Ill., 3 killed, 2 of them tramps.

23. Fire: School of Arts burned at Chalons-sur-Marne, France, much valuable machinery ruined.

24. Fire: tobacco factory burned in Montreal.

25. Dam bursts near Bougy, France, 180 lives lost. Train wrecked near South Brewer, Me., 1 killed.

Fires in April: East Orange, N. J., electrical works burned, loss, \$245,000; Columbus, Ind., starch works, \$200,000; Wheeling, W. Va., warehouses, etc., \$200,000; Pasadena, Cal., hotel, \$500,000; Ardsmore, Indian Territory, business blocks, \$500,000; Glen Carbon, Ill., brick works, \$250,000; Plattaburg, Mo., courthouse, etc., \$200,000; Philadelphia, bakery, etc., \$275,000; New York, grocery warehouse, \$300,000; Montreal, tobacco factory, \$500,000; and 185 others; aggregate loss, \$11,013,150.

Summary of train accidents in April: 33 collisions, 75 derailments, 9 miscellaneous; total, 117. Killed: 17 employees, 3 passengers, 7 others; total, 27. Hurt: 30 employees, 21 passengers, 19 others; total, 90.

May 1. Tornado in Kansas, 10 lives lost, many buildings wrecked.

2. Tornado in Iowa, more than 100 lives lost.

3. A locomotive runs away near Clarksville, Ark., collision results, in which 15 are hurt. Trains wrecked near Farmland, Ind., and Hyde Park, Mass., 3 killed, 5 hurt.

4. Destructive storms in the West and South.

5. A wrecking train breaks down a flooded bridge near Massillon, Ohio, 1 drowned, 4 hurt.

6. Beaver Falls, Pa., train thrown into the river and 1 man drowned. Union Point, Ga., a misplaced switch wrecks a train and hurts 3 persons. Train

wrecked near Elizabethport, N. J., 1 killed, 1 hurt. Signal man found guilty of manslaughter. A landslide wrecks a train near Mount Union, Pa., 17 loaded coal cars carried into the Juanita river. Killing frosts occur in most of the Northern States.

12. Trains wrecked at Middlesburg, N. C., and Hornselleville, N. Y., 3 killed, 2 hurt. Crops damaged by frost in New York and Pennsylvania.

14. Trains wrecked near West Bend, Iowa, and Silex, Mo., 3 killed, 20 hurt.

16. Train wrecked near Saratoga, N. Y., 1 killed.

18. Train wrecked by malice near Jacksonborough, S. C., 5 hurt; also near Bound Brook, N. J., 1 killed, 4 hurt. Fire: buildings burned in London, loss, \$1,000,000.

19. Earthquake near Florence, Italy, many famous buildings seriously damaged, several lives lost.

21. Explosion of nitroglycerin at Pinole, Cal., 14 killed.

21-23. Trains wrecked near Pavonia, Ohio, 1 killed; Cheyenne, Wyo., 2 killed; Danville, Ky., 2 tramps killed.

28. Shipwrecks: American steamer Collins sinks off Manzanillo, Mexico, and French steamer Don Pedro off the Spanish coast, 100 lives lost.

29. Train wrecked near Reno, Nev., 1 tramp killed.

30. Mischievous boys near Providence, R. I., cause the wreck of 4 cars, 2 men hurt. Train wrecked near Deer Park, Texas, 2 killed, 3 hurt.

31. Circus train wrecked near Escambia, Mich., 5 hurt.

Fires in May: Buffalo, N. Y., tannery burned, loss, \$250,000; Port Huron, Mich., grain elevator, \$157,000; Coney Island, N. Y., sundry buildings, \$350,000; St. Albans, Vt., business block, \$300,000; Stevens Point, Wis., pulp mills, \$150,000; Cambridgeport, Mass., \$131,000; Toledo, Ohio, mills, etc., \$140,000; Henderson, Ky., tobacco warehouses, \$125,000; and 147 others; aggregate loss, \$7,761,350.

Summary of train accidents in May: 47 collisions, 58 derailments, 6 miscellaneous; total, 111. Killed: 16 employees, 3 passengers, 6 others; total, 25. Hurt: 63 employees, 62 passengers, 3 others; total, 127.

June 2. Train wrecked, Great Springs, W. Va., 3 tramps hurt; another near Oxford, Neb., 4 killed, 1 hurt.

5. Car derailed near Goshen, N. Y., thrown to other track where it was immediately run into, and 31 cars wrecked, 2 men hurt. Train derailed near Darien, N. Y., wreck catches fire, 50 cars burned, 3 men hurt. Flames extinguished by residents.

6. Trains wrecked near Locustdale, Pa., and Benton, Ark., 6 killed, 6 hurt, 30 cars wrecked.

8-9. Trains wrecked near Dunham, Ala., 1 killed; Logansport, Ind., 1 killed, 1 hurt; and Dixon, Ill., 2 killed, 1 hurt.

10. A relief train carrying a fire engine to Cameron, W. Va., is wrecked near Roebys, 2 killed, 3 hurt, some of them firemen. Train wrecked near Sidney, Ohio, 3 tramps killed, 4 tramps hurt.

11. Train wrecked near Sargent, Pa., 13 tramps on board, 1 killed, 2 hurt; a bad oil fire ensues, other tramps supposed to have perished. Trains wrecked near Collins, Pa., and Quincy, Ill., 3 killed, 3 hurt.

14. Train derailed near Hardyville, S. C., 3 tramps killed, 1 employee hurt.

19. Train wrecked near Bedford, Ind., several tramps hurt.

20-23. Trains wrecked near Barry, Pa., 2 tramps and 3 employees hurt; Eureka, Texas, 6 hurt; Noland, New Mexico, 1 killed, 2 hurt; Cepake, N. Y., 8 hurt; Milledgeville, Ga., 1 killed, 2 hurt; and Aiken, S. C., 5 killed, 1 hurt. The last accident probably caused by malice.

Fires in June: Newark, N. J., brewery burned, loss, \$274,000; Kalamazoo, Mich., lumber, etc., \$220,000; Cameron, W. Va., sundry, \$220,000; South Chicago, Ill., business block, \$200,000; New York, theater, \$200,000; Greenville, Ohio, sundry, \$225,000; Minneapolis, warehouse, \$260,000; San Francisco,

sundry, \$1,000,000; and 154 others; aggregate loss, \$9,320,000.

Summary of train accidents in June: 40 collisions, 25 derailments, 4 others; total, 69. Killed: 23 employees, 2 passengers; 11 others; total, 35. Hurt: 51 employees, 17 passengers, 15 others; total, 83.

July 1. Train wrecked, Laughlin, Pa., 1 killed, 1 hurt. Fire: Godillot's military outfit establishment in Paris burned, loss, about \$1,000,000.

9-3. Trains wrecked near Middlesburg, Ky., 1 killed, 1 hurt; Niantic, Ill., 2 killed, 1 hurt.

4. Waterspouts, tornadoes, and violent storms of destructive force in various parts of the Mississippi valley. Train derailed at Pekin, Ill., 1 killed, 4 hurt.

8. Fire: 200 houses burned at Sambrow, Poland. Excursion train carrying Canadian pilgrims to the shrine of St. Anne of Beaupré wrecked near Levis, Canada, 13 killed, 80 hurt. Trains wrecked near Ocean View, Cal., and Town Creek, Pa., 2 killed, 1 hurt.

10. Fall of Casino roof in Atlantic City, upward of 100 killed or hurt.

11. Fire at Hesse-Nassau, Germany, 10 killed, many left homeless. Trains wrecked at White Sulphur, Ohio, and Ponchataula, La., 2 killed, 2 hurt, 21 cars wrecked.

12. Extensive forest fires in northern Michigan.

13. Tornado near New York city, 5 killed, many hurt.

14. Train wrecked near Handley, Texas, 2 killed.

17. Railway trestle breaks near Monument, Col., 3 killed, 13 hurt, 11 of the latter tramps. Thirteen cars wrecked near Plymouth, Pa., 1 killed, 1 hurt.

19. Violent storms in the West, many lives lost and buildings wrecked. Trains wrecked at Fort Payne, Ala., and Pleasant Hill, N. C., 3 killed, 2 of them tramps.

21. Disastrous storms continue at the West, with further sacrifice of life. Fire: oil mill burned at Chicago, loss, \$900,000. Shipwreck: Italian steamer *Ortorgia* sunk in collision with the *Maria P.* in the Gulf of Genoa, 150 lives lost.

23. Mine flooded in Japan, 47 drowned.

24. Explosion: fire damp in a mine in Westphalia, 30 killed. Train wrecked, Greenville, Pa., 1 killed.

26. Troop train wrecked near Kobe, Japan, 114 killed.

29. Cholera epidemic in Japan, nearly 5,000 fatal cases reported.

30. Floods near Fort Scott, Kan., 2 lives lost.

31. Landslide and furious storm near Adelaide, Col., train derailed, 2 men drowned.

Fires in July: Wellington, Ohio, nearly ruined, \$150,000; New Westminster, British Columbia, mills and factories burned, loss, \$165,000; Scotia, Cal., lumber, \$250,000; Oswego, N. Y., sundry, \$153,000; Lewiston, N. Y., steamer and hotel, \$265,000; Cincinnati, grain warehouses, \$175,000; Chicago, oil mills, \$400,000; Glen Haven, Pa., lumber, \$175,000; New York, office building, \$150,000; Menominee, Mich., \$500,000; and 163 others; aggregate loss, \$9,085,000.

Summary of train accidents in July: 33 collisions, 52 derailments, 3 others; total, 88. Killed: 16 employees, 1 passenger, 8 others; total 25. Hurt: 48 employees, 19 passengers, 9 others; total, 76.

August 2. Coal mine flooded at Saltcoats, Scotland, 14 lives lost. Train wrecked near Canton, Ohio, 13 tramps on board, 2 killed, 5 hurt.

3. Trains in collision near Norwich, Ohio, wreck taken fire, 1 killed, 1 hurt; also near Cockran's Mills, Pa., and Middletown, N. Y., 2 killed, 2 hurt.

4. Fire: car shops burn at Sprague, Wash. Train wrecked near Kinsborton, Pa., 1 killed, 7 hurt.

5. Shipwreck: British steamer *Atherton* sinks off Sydney, 54 lives lost. Trains wrecked at Plymouth, N. H., and Great Falls, Mont., 3 killed, 5 hurt.

9. Trains derailed, Crowell, New Brunswick, and Shelton, Wash., 4 killed, 3 hurt.

10. Train derailed by a broken drawbar near St. Paul, Ind., 19 tramps on board, 1 killed, 5 hurt.

11. Extensive forest fires in the Northwest, 2 lives lost. Trains wrecked at Cameron, W. Va., and Bain-

bridge, Ohio; at the latter place 20 cars fell into the Paint river, 50 feet.

14. Train derailed near Pomfret, Conn., 3 tramps killed, 1 hurt.

15. Fire in Przytyk, Poland, probably of incendiary origin, 4,000 persons rendered homeless. Trains wrecked at Liberty Park, N. J., and Temple, Texas, 3 killed, 35 hurt.

16. A party of boys switched off some cars to a side track near Aurora, Ill., a collision resulted, and as a car was loaded with sulphuric acid one of the boys met a terrible death and 5 of his companions were dreadfully burned.

18. Train wrecked near Three Bridges, N. J., 1 killed.

19. Steam boiler explodes in a hotel at Denver, 26 killed, building burned.

20. Train wrecked near Lawrenceburg, Ind., 1 killed, 1 hurt.

21. Coliseum building falls in Chicago, loss about \$200,000. Train wrecked at Pamplin's, Va., 2 killed.

22. Dynamite maliciously placed on the track near Butte, Mont., nearly the whole train passes before explosion, 1 car wrecked, 1 person hurt.

24. Train wrecked at Pulaski, N. Y., 1 tramp killed, 2 tramps hurt.

25. Trains derailed at Richmond Beach, Wash., and Edgemont, S. Dak., 2 killed.

27. Trains wrecked at Runge, Texas, Sullivan, Mo., and Fisher, Col., 4 killed, 3 hurt.

30. Train derailed by malice near Portland, W. Va., 10 cars thrown into the Ohio river, station fired. Train wrecked, Pope's Ferry, Ga., 2 killed, 8 hurt, and at Erie, Pa., 2 killed.

31. Trains derailed at Craryville, N. Y., and Huntington, Pa., 2 killed, 1 hurt.

Fires in August: Sprague, Wash., railroad property burned, loss, \$1,000,000; Berlin, Md., sundry, \$200,000; Warren, Mass., factory, \$375,000; Lockport, Ill., sundry, \$250,000; Newark, N. J., factory, \$500,000; Philadelphia, factory, \$250,000; Bingham, Utah, sundry, \$200,000; Milwaukee, Wis., warehouses, \$250,000; Cincinnati, warehouse, \$190,000; and 172 others; aggregate loss, \$9,929,000.

Summary of train accidents in August: 53 collisions, 71 derailments, 8 others; total, 132. Killed: 30 employees, 8 passengers, 11 others; total, 49. Hurt: 41 employees, 78 passengers, 21 others; total, 140.

September 1. Earthquake shock in New York, New Jersey, Pennsylvania, and Delaware. Fire: Academy of Music burned in Buffalo, loss, \$250,000.

2. Runaway locomotive near Woodlawn, N. Y., in collision with passenger trains, 2 killed, 40 hurt.

5. Floods in eastern Mexico, much suffering among the peons.

6. Fire in copper mine near Houghton, Mich., 35 lives lost.

7. Trains in collision at Blanchet, Ky., 2 killed. Train derailed at Monmouth, Kan., 13 hurt.

8. Widespread forest fires in Wisconsin.

9. Train derailed by a washout, Neosho, Mo., 1 killed, 1 hurt.

10. Train derailed at Evansville, Wis., 2 killed. Train in collision at Sealy, Texas, 1 killed, 2 hurt.

11. Trains in collision at Melville, Minn., 13 hurt.

12. Trains in collision, Altona, Ill., 1 killed, 1 hurt.

15. Train derailed, Collinsville, Ill., 1 killed, 2 hurt.

16. Trains derailed, Bonnieville, Ky., and Annandale, Minn. Altogether 1 killed, 18 hurt, 4 of them tramps.

18. Train wrecked, Greensburg, Ind., 1 killed, several hurt.

19. Shipwreck: Spanish war ship *Sanchez Barcaizetegu* in collision, 35 drowned, including Admiral Parejo and several other officers.

21. Trains in collision at Drummond and Percy, Ill., 3 killed, 2 hurt, all tramps.

22. Heavy snow and frost in Colorado. Destructive prairie fires in south Oklahoma.

23. Train derailed, Gypsum City, Kan., 1 killed, 1

hurt. Also, Washington, Ill., 2 killed. Floods in western Siberia.

24. Train derailed, Lumberton, Miss., probably by malice, 1 killed.

25. Trains in collision at Tunnelton, W. Va., 12 hurt.

26. Trains in collision at Gallinan, Miss., fireman killed, also 1 tramp and 2 train hands. Train derailed by running over a mule, Annada, Mo., 11 hurt. Trains derailed by fallen tree, Stony Creek, Pa., engine and 12 cars wrecked because the man who cut down the tree did not know enough to flag the train.

27. Train derailed, Croton, N. Y., 2 tramps killed, 1 train hand hurt.

Fires in September: Buffalo, N. Y., Academy of Music, loss, \$250,000; East Boston, Mass., warehouses, \$347,000; Oshkosh, Wis., factories, \$275,000; Indianapolis, business houses, \$350,000; Fond du Lac, Wis., lumber, etc., \$250,000; Philadelphia, Pa., warehouses, \$675,000; Cincinnati, Ohio, tobacco, \$190,000; and 212 others; aggregate loss, \$1,076,800.

Summary of train accidents in September: 50 collisions, 64 derailments, 4 others; total, 108. Killed: 25 employees, 2 passengers, 11 others; total, 38. Hurt: 22 employees, 114 passengers, 12 others; total, 179.

October 1. Train wrecked, Hulen, Texas, 1 killed, 6 hurt.

2. Trains wrecked at Red Oak, Ga., and Blackstone, Jamaica, Mass., 3 killed, 2 hurt.

3. Trains in collision, Bethune, Col., 1 killed, 2 hurt.

4. Train wrecked, Manor, Pa., 1 killed, 25 hurt.

5. Train wrecked, Bradford, Pa., 1 killed, 2 hurt.

6. Train wrecked, East St. Louis, Mo., and Amagasaki, N. Y., 3 killed, 5 hurt.

7. Train derailed, Ceylon, Ind., 3 killed, several hurt.

8. Train wrecked, Bond Hill, Ohio, 1 killed, 2 hurt.

9. Witheville, Va., train wrecked, 3 killed.

10. Trains wrecked, Hyde Park, Mass., Valley Junction, Iowa, and Bailey's, Pa., 5 killed, 32 hurt.

Fires in October: At Philadelphia, factory, loss, \$330,000; Cambridge, Ohio, sundry buildings, \$300,000; Warren, R. I., cotton mills, \$1,350,000; Green Bay, Wis., lumber, \$100,000; Portsmouth, Va., warehouses and lumber, \$250,000; New Orleans, rice mills, \$500,000; Algiers, La., sundry buildings, \$425,000; Gilsumburg, Ohio, sundry buildings, \$350,000; Glassboro, N. J., glass works, \$275,000; and about 150 others; aggregate for the month, \$13,411,500.

Summary of train accidents in October: 60 collisions, 64 derailments, 7 others; total, 131. Killed: 40 employees, 3 passengers, 6 others; total, 49. Hurt: 78 employees, 97 passengers, 3 others; total, 178.

November 1. Train wrecked, Edgeworth, Mass., 2 killed, 11 hurt.

2. Train wrecked, Waxahatchie, Texas, 1 killed, 23 hurt. Elm Grove, W. Va., 2 killed, 25 hurt. Collision:

Electric car and road wagon, Dayton, Ohio, 15 hurt; horses paralyzed by an electric shock in crossing track, collisions, omitted.

3. Train wrecked, Franklin, Tenn., 2 killed. Locomotive boiler explodes, Warwick, N. Y., 4 killed.

4. Train wrecked, America, Ala., 4 killed, 2 hurt.

5. Electric car falls through open drawbridge, Cleveland, Ohio, 19 killed.

6. Fast mail train maliciously wrecked by 4 boys near Rosu, N. Y., 2 killed, 11 hurt; alleged object of robbers, plunder. Train wrecked on East River Bridge, New York and Brooklyn, 2 killed, 2 hurt; names, lost.

7. Explosion of cartridges at Barcelona, Spain, 70 killed. Train wrecked, Lamar, Miss., 2 killed.

8. Mining accident, Brewsters, N. Y., 13 killed.

Fires in November: Waleott, Minn., flour mills, loss, \$150,000; New York, 2 fires, business houses, \$100,000 and \$1,000,000; North Penn Junction, Pa., rail works, \$175,000; York, Pa., wall paper, \$200,000; Meridian, Miss., cotton, \$350,000; Dallas, Texas, business houses, \$175,000; Chicago, business houses, 2

fires, \$500,000 and \$400,000; and about 150 others; aggregate, \$1,013,500.

Summary of train accidents in November: 50 collisions, 62 derailments, 4 others; total, 146. Killed: 34 employees, 4 passengers, 4 others; total, 42. Hurt: 87 employees, 78 passengers, 4 others; total, 169.

December 17. Explosion and shipwreck, German ship Athens, off Cape May, N. J., 15 lives lost.

19. Explosion in mine, Cumstock, N. C., 34 killed.

21. Explosion in mine, Dayton, Tenn., 34 killed.

23. Disastrous floods in Southwestern States. Many lives lost. Estimated destruction of property, \$1,000,000.

27. Panic caused by cry of "Fire!" in a theater, Baltimore, Md., 23 killed, 30 hurt.

30. Violent and destructive storm on the north Atlantic coast.

Fires in December: Indianapolis, business houses, loss, \$485,000; Chicago, business houses, \$250,000; San Francisco, business houses, \$350,000; Monmouth, Ill., plow factory, \$300,000; Council Bluffs, Iowa, warehouse, \$200,000; New York (city), warehouses, \$250,000; Baltimore, clothing stores, etc., \$350,000; total number of fires, 223; aggregate loss, \$1,613,500.

Total number of fires in the United States in 1895: 2,418, not counting those where the loss was less than \$10,000. Aggregate loss for the year, \$129,809,700.

Summary of train accidents in December: 72 collisions, 79 derailments, 6 others; total, 157. Killed: 41 employees, 4 passengers, 3 others; total, 48. Hurt: 84 employees, 107 passengers, 3 others; total, 199.

Summary of train accidents for 1895: 602 collisions, 810 derailments, 75 others; total, 1,487. Killed: 303 employees, 33 passengers, 75 others; total, 411. Hurt: 739 employees, 701 passengers, 95 others; total, 1,535.

DISCIPLES OF CHRIST. The general missionary meetings of the Disciples of Christ were held in Dallas, Texas, beginning with the twenty-first annual meeting of the Christian Woman's Board of Missions, Oct. 18. The treasurer's report showed that the collections during the year had amounted to \$64,192, which, with the addition of a balance from the previous year of \$17,040, made the total resources \$81,232. Of this sum \$75,517 had been disbursed. The whole amount of the collections for the twenty-one years of the existence of the board was \$424,987. The children's mission bands and junior societies, with 10,750 members, had contributed a "Little Missionary fund" of \$5,548. The society had nearly 50 missionaries laboring in the United States, India, and Jamaica, and was sustaining an academy at Hazel Green in the mountains of Kentucky and 2 chairs for instruction in the English Bible in the University of Michigan; while the State organizations associated with it were supporting several evangelists in the West and a Chinese Mission in Portland, Ore. The erection of a missionary training school in Jamaica was considered.

The Foreign Christian Missionary Society met on Oct. 21. The receipts for the year had been \$83,514, showing a gain of \$10,356 over those of the previous year. A movement instituted in 1894 to enlist a larger number of churches in the work of the society had resulted in increasing the number of contributing churches from 1,806 to 2,403, or from about 25 per cent. to 334 per cent. of the whole number. A One Dollar League organized in the Sunday schools had enlisted the co-operation of 2,100 pupils, some of whom raised \$6, while others raised from \$2 to \$3 each. The Endeavor societies had been asked to raise \$5,000 with which to erect a building in

Tokio, Japan; and the Young People's Heathen Bidding fund had been started to raise \$20,000 on a system of shares. The society had about 140 missionaries and helpers laboring in England, Scandinavia, Turkey, India, Japan, and China, where the Gospel was preached at 59 stations and out stations. About 8,000 members had been received into these churches since the work began. Schools were sustained in India, China, and Japan.

The General Christian Missionary Convention—which has charge of domestic missionary work—met Oct. 22. The total receipts for the year had been \$23,642, while \$52,858 had been raised by the missionaries. Fifty-four missionaries had been employed, under whose labors 2,650 persons had been brought into the church (including 341 by letter), 1,703 baptized, 13 churches organized, and 68 new places visited. Besides this work, 37 States and 3 provinces had missionary organizations, which together employed 428 missionaries, whose work had given 21,418 accessions, and who had organized 186 churches and 274 Sunday schools. For these State missions \$235,667 had been raised during the year. Adding to this amount that raised by the General Board and its missionaries (\$76,500), \$24,017 by the Board of Church Extension, \$6,938 by the Board of Negro Education and Evangelization, \$10,348 for city evangelization, \$203,475 for colleges, \$600,000 for church building, and \$7,360 for benevolence, the whole year's contributions of the Disciples for home work footed up to \$1,164,305. Besides the stationed missionaries, a considerable number of evangelists had been sent out, who had labored effectively in many places. With the aid of a fund contributed in special gifts a systematic effort had been begun at evangelization in the great cities. The name of the convention was changed to American Christian Missionary Society.

The receipts of the Board of Church Extension (\$24,017) were \$2,114 more than those of the previous year. Loans had been made to the amount of \$22,725, and a considerable number of loans ranging from \$75 to \$1,500 each had been promised, to be paid upon the completion of the buildings and the furnishing of satisfactory security. The National Superintendent of Sunday Schools estimated the number of Disciples' schools in the United States to be about 7,500, with an aggregate enrollment of 675,000 pupils. The term Bible school was adopted to designate these schools. The National Superintendent of Christian Endeavor reported 3,096 societies, an increase during the year of 650 societies. The report on junior societies gave the number as 892. The report on negro education and evangelization showed that the work was increasing in efficiency. Resolutions were passed at the meet-

ings asking the United States Government to take prompt measures for the protection of the missionaries in China, and commending the governors of Texas and Arkansas for their energy in preventing a prize fight which had been arranged to be fought first in the former State and afterward, when not permitted there, in the latter.

DOG SHELTERS. The most famous establishments in which lost, strayed, and captured dogs are cared for, are at Battersea, London, England, and *La Fourrière* in Paris, which is also a police adjunct. Under an act of the Legislature shelter has been provided in New York for homeless and unlicensed dogs, and so successful has it proved that another one has been established in Brooklyn. The dog-catching powers have been placed where they should be—in the hands of The American Society for the Prevention of Cruelty to Animals—and instead of an incentive to theft and cruelty in the form of a payment of from 30 to 50 cents for each dog captured the men who go about after the city's surplus dogs are paid a salary, are placed under bonds, and are dismissed at once when an act of cruelty is proved against them. No longer is the old dog cart, with its brutal and ignorant catcher, sent about to take up the homeless, starving, and dangerous dogs, throw them carelessly into a pen, and let them suffer three days or more before being drowned. Neat and comfortable ambulances go about the streets, to take to the commodious shelter at 102d Street and East River all the stray, maimed, homeless, or injured dogs and cats that may need care. John P. Haines, President of The American Society for the Prevention of Cruelty to Animals, who succeeded in getting the legislation that

THE AMBULANCE.

accomplishes these wonders, is in daily receipt of postal cards and letters asking him to send his men to get dogs. The law referred to contains these provisions:

Every person who owns or harbors one or more dogs within the corporate limits of any city having a population of over 800,000 shall procure a yearly license and pay the sum of \$2 for each dog, and in applying for such license the owner shall state in writing the name, sex, breed, age, color, and markings of the dog.

Licenses granted under this act shall date from the 1st day of May in each year, and must be renewed prior to the expiration of the term by the payment of \$1 for each renewal.

Each certificate of license or renewal shall state the name and address of the owner of the dog, and also the number of such license or renewal.

Every dog so licensed shall at all times have a collar about its neck with a metal tag attached thereto bearing the number of the license. Such tag shall be supplied to the owner with the certificate of license, and shall be of such form and design as the society empowered to carry out the provisions of this act shall designate, and duplicate tags may be issued only on proof of loss of the original and the payment of the sum of \$1 therefor.

Dogs not licensed pursuant to the provisions of this act shall be seized, and, if not redeemed within forty-eight hours, may be destroyed or otherwise disposed of at the discretion of the society empowered and authorized to carry out the provisions of this act.

It is further provided that any cat found within the corporate limits of any such city without a collar

The passage of this law repealed the laws relating to seizure of dogs, and among these one of the most inhuman, useless, and unnecessary ever enacted—the law in regard to muzzling. By the provisions of the foregoing act The American Society for the Prevention of Cruelty to Animals was empowered to issue dog licenses and collect the fees therefor, provided that the society shall defray the cost of carrying out the provisions of the act and maintain a shelter for lost, strayed, or homeless animals.

The constitutionality of the law was at first strongly questioned, but it has been held by the courts that, while such a society is a private corporation, it may have functions to perform as the agent of the State which are for the public good and are essentially a police regulation.

The New York Dog Shelter is a long, low building, only 1 story in height and 100 feet long by 25 feet in width. It has accommoda-

CORRIDOR, SHOWING CAT-CAGES.

about its neck bearing the name and residence of the owner stamped thereon may be seized and disposed of in like manner as prescribed above for dogs.

The American Society for the Prevention of Cruelty to Animals is hereby empowered and authorized to carry out the provisions of this act, and the said society is further authorized to issue the licenses and renewals, and to collect the fees therefor, provided, however, that the said society shall defray the cost of carrying out the provisions of this act and maintaining a shelter for lost, strayed, or homeless animals.

tions for 300 dogs and 200 cats. The service consists of 5 ambulances and 2 other wagons, with 12 horses and the necessary stabling, the employees in all numbering 22 persons. These latter are in direct communication with the headquarters of the society, and make daily reports.

The Battersea Home for Dogs, in London, is the only one that can claim to be compared with the New York and Brooklyn Shelters. There the dogs are kept for a certain length of time, and

humanely put out of existence when not claimed. At *La Poudrière*, in Paris, they are simply drowned and their bodies carted away, unless the owner calls and can prove ownership within a very short time. The Battersea establishment has the assistance of the police of the metropolitan area, its operations extending throughout the city and county of London. In 1893 this home received 17,928 dogs. The New York Dog Shelter, unaided by the police, received in the first

The writer has often seen, under the old condition of things, a cage half as big as the bottom of a wagon full of wretched, frightened, injured, and famished dogs, big and little together, emptied over the top of the high board fence, inclosing the run in the old 16th Street pound, upon the hard floor below. Some of them had legs broken in the rude fall where they had no chance to save themselves; others were stunned and remained for hours lying

THE COOKING-APPARATUS.

eight months of its work 5,111 dogs; the total number of animals received was 22,028, of which 632 were lost animals restored to their owners. The first year the new dog law was tried and licensed dogs in New York were allowed to go unmuzzled the newspapers remarked that there was less hydrophobia than in many years. This was the first summer in many years when there was not a single paroxysm of popular apprehension of hydrophobia.

From 25 to 35 dogs and cats a day are now brought in by the society's agents. They are kept three days unless they are especially valuable, in which case the society tries to secure good homes for them, or in any case keeps them a little longer. If an owner or somebody else does not redeem an animal in three days, it is placed in the death chamber and asphyxiated.

The Dog Shelter at the foot of East 102d Street has the cool and refreshing background of the East River as one of its attractions during the summer time, when by far the larger number of the captured animals are brought in. In New York and Brooklyn about 150 dogs and cats are received each day. The former New York dog pound was dirty, disgracefully brutal in all its appointments, and the scene of constant recriminations, sometimes rows, between the owners of captured pets and the ruffians who had caught them or the officials in charge.

where they fell, moaning piteously. And then the poor creatures were driven, kicked, and crushed into the big iron cage, which would lower them into the water and still forever their half-human plaints.

Those old-time keepers, heroes of rattling matches and dog-pit escapades, enjoyed but one thing more than torturing the curs, which they called "ash barrels," and that was the capturing of some fine specimen from which they would tear the collar and chain and license mark, or pull it from its shrieking mistress's arms, and never let it get to the pound where it could be redeemed. The old dog pound caused a stench that could be perceived for blocks around, and the howlings of the inmates could be heard almost as far. From the wide-open door of the present shelter to the genial face of Keeper Read everything beams with humanity. The ambulances are often sent for to remove suffering animals. These ambulances are painted red. Back of the office the shelter is divided on one side into three long runs; on the other, it has kennels for the more valuable of the dogs and cages for the cats, while down the middle is an open space that enables visitors to walk through the place. In one of the long pens are the dogs brought in during the day, in another the bitches, and in another the animals condemned to the daily execution because their time is up. One of the most interesting features of the whole

establishment is the daily reception held here of people of all sorts who have lost pets.

CATS IN CAGES.

The sanitary arrangements of the shelter are perfect, floors, partitions, doors, windows, pens, food troughs, and everything else being scrubbed every day and disinfected. There are engines and large boilers where the food is cooked for all

these four-footed guests. The dogs get heart, liver, and waste from neighboring butcher shops three times a day, and the cats get all the meat they can eat, and every morning a ration of milk.

It is a treat to see an ambulance come in. The vehicle is backed into the place so that escapes are impossible, and the dogs and cats are gently removed and placed in their runs. Each cat is in a little wicker basket by herself, safe from annoyance by the dogs.

The Brooklyn Shelter is in the geographical center of the City of Churches, at the corner of Malbone Street and Nostrand Avenue. The accommodations here are only to be regarded as temporary, but the place is meeting a want that has made itself felt in Brooklyn for a long time.

Illuminating gas is used for the humane destruction of the animals, as it has been found to produce death more quickly and painlessly than any other practicable agent. The license system, as it is carried out by the society, has proved to be a valuable security to the owners of dogs, and the liberal reward which the society offers for the detection of any person who may steal a dog bearing a license tag has proved to be an effectual preventive of larcenies of that kind. Cats, also, when they wear a collar, as required by the law, with the name and residence of its owner stamped thereon, can easily be recovered if they are captured while straying from their homes. The successful administration of the law would have been much more difficult than it has proved to be if the citizens of New York had not given their confidence and support to the society. The work has been both onerous and difficult, sometimes delicate; but the earnest endeavor of the society to act in the interest of the animals, and also of their owners, has been so fairly and fully appreciated that the burden of difficulty has been reduced to a minimum, and the officers of the society have been both cheered and encouraged by the consciousness of popular confidence and approval.

DOMINION OF CANADA. (See CANADA.)

E

EAST AFRICA. The Sultan of Zanzibar formerly claimed sovereign rights over the coast of Africa from Cape Guardafui to the Rovuma, the northern boundary of the Portuguese colony of Mozambique, and maintained stations at all the trading points, the *termini* of the caravan routes, the northernmost being Warsheikh, in 90° of northern latitude. His influence extended inland along the commercial routes, which were kept open by the troops that he maintained for the purpose of conveying caravans. In 1884 agents of the German East African Association concluded treaties with native chiefs back of the coast opposite the island of Zanzibar. The association was chartered as the German East African Company, and received a patent of imperial protection from the German Government on March 3, 1885. In 1886 a joint commission, representing Ger-

many, Great Britain, and France, after determining that the Sultan's rights were confined to a strip of coast 10 miles wide, agreed that Germany should have a sphere of influence from the Rovuma northward to, and including the Kilimanjaro mountains, extending inland to the boundary of the Congo Free State, and that the region north of the German sphere between the Umbe and the Tana rivers, should be recognized as England's sphere of influence, save the sultanate of Vitu, with which Germany had concluded a treaty of protection. In May, 1888, the German company acquired by purchase from the Sultan of Zanzibar the right to administer and collect the customs of the mainland within the German sphere for the period of fifty years. The Imperial British East Africa Company, chartered by the British Government

on Sept. 3, 1888, obtained similar rights over the coast north of the Umbe as far as Kipini, on the Ozi river. In 1890 a new Anglo-German agreement was made, whereby Germany ceded to England the enclave of Vitu and recognized her right to acquire full sovereignty over the coast from the Umbe to the river Juba in 6° north latitude, and to establish a protectorate over the sultanate of Zanzibar, while England conceded to Germany the right to acquire all the rights of the Sultan over her part of the coast, for which she paid 4,000,000 marks. The coast north of the Juba had been abandoned by Great Britain to Italy in 1889. In October of the year 1891 British officials took charge of the administration of the remaining territory of the Sultan, Zanzibar and Pemba, and the smaller islands of Manda and Patta.

British East Africa.—The territory which the Imperial British East Africa Company undertook to develop and administer, to which, from the initials of the company's title, the name *Ibea* was given, has a coast line of 400 miles and extends inland an equal distance, to Lake Victoria. The British sphere embraced besides Uganda, Unyoro, Ankori, Mpororo, Koki, a part of Ruanda; also, according to British claims and agreements made with Germany and Italy, Emin Pasha's Equatorial Province and a part of Kordofan and Darfur, all of which were formerly subject to Egypt, as well as a large part of Somaliland. The total area is over 1,000,000 square miles. The company, whose capital was £2,000,000, of which £1,000,000 were paid-up shares, improved the harbor at Mombasa and built a road to Kibwezi, half way to Lake Victoria. The customs were collected, amounting to 214,872 rupees in 1891, 239,812 in 1892, and 261,554 in 1893. After the supersession of the Sultan's government in Zanzibar by British administrators the company sought to escape the annual payment of \$80,000 to the Sultan. The fear that the King of Uganda would accept a German protectorate led the company in 1890 to occupy that country with a military force. At the end of March, 1893, the company's forces evacuated that country, being succeeded by British troops, and on June 19, 1894, a British protectorate over Uganda was proclaimed. The administration of Witu was relinquished in July, 1893, and the authority of the Mohammedan Sultan was restored under a British protection and supervision. Treaties were made by the company with Somali chiefs in the north, and commercial intercourse with Gallaland established. A railroad route, 657 miles long, from Mombasa to Lake Victoria, was surveyed while the company held Uganda.

The imports of British East Africa in 1893 were 1,807,308 rupees in value, against 2,083,209 in 1892; the exports were 1,287,399 rupees, against 1,090,173. The shipping entered at Mombasa in 1893 had an aggregate tonnage of 100,602 tons; cleared, 100,308 tons.

The British East Africa Company, which had issued bonds at 2 per cent. for £450,000 and expended that amount, surrendered its charter and transferred its territory to the British Government on July 1, 1895. The Government paid £50,000 for the surrender of the charter and improvements behind the 10-mile strip, and Par-

liament voted £30,000 for the administration of the country, which includes the 10-mile strip leased from the Sultan of Zanzibar and the mainland between it and Uganda. The Sultan was made to pay £200,000 to the company to redeem the concessions granted to the company; but the interest at 3 per cent. on this sum, as well as the annual rent of £11,000 for the strip of coast territory, the British Government agreed to pay. The 10-mile strip and the country between it and Uganda were consolidated under a single administration, leaving the Zanzibar islands and the Uganda protectorate to be managed as before. The separate protectorate thus formed was placed in charge of officials subject to the authority of the consul general at Zanzibar, who also controls the affairs both of Zanzibar and of Uganda. The coast strip belonging to Zanzibar is still under the Sultan's sovereignty, and Mohammedan laws and religion remain established. The cost of administration for the protectorate, including the sultanate of Witu, was estimated at £30,000 a year. The revenue from customs amounted to about £15,000.

The British Government decided to build a railroad from the coast to Uganda. The proposed route is 657 miles in length. The cost is estimated at £2,700 a mile, £1,865,000 in all, including four years' interest during construction. The revenue is estimated, on the basis of £17 a ton between Mombasa and Lake Victoria, at £60,000, besides £33,500 saved on Government transport, which would make the income at the start nearly equal to the expenditures, counting the working expenses £40,000 and 3 per cent. interest on the debt £56,000. The House of Commons on Aug. 31 granted a preliminary vote of £20,000 to start the line, which is to be built and managed directly by the Government.

In the early part of 1895 the Masai became troublesome near the coast. They murdered Dr. Kolb and Dr. Kutchner, members of the Austrian Freeland expedition, which intended to found a communistic settlement near Mount Kilimanjaro. This expedition broke up before reaching its destination, the leader accusing the English officials of deliberately thwarting their object by detaining their arms and neglecting to provide the promised steamer and by instigating the natives to withhold supplies. The Somalis also made raids on the Tana river. In May an Arab chief, Mbaruk bin Rashid, who had a stronghold near Mombasa and a well-armed following of 1,200 runaway slaves, began to defy the British authorities, attacking missionary stations and capturing Europeans, whom he held for ransom. Sir Lloyd M. Mathews and the British consul general proceeded to the spot with 250 *askaris* from Zanzibar, 100 Sudanese from Witu, and a naval force consisting of 4 gunboats. On June 16 the native troops and 350 blue jackets landed, and after taking possession of the town of Takaungu burned 5 villages and destroyed crops, meeting only slight opposition. Capt. Raikes remained with a garrison of 100 Zanzibaris. The Arabs attacked on July 7, killing and wounding 3 officers and 7 men, in consequence of which a second punitive expedition went out under Admiral Rawson and Gen. Mathews. The troops took Mwele, the native stronghold, by storm,

with a loss of 2 killed and 8 wounded. Some of the rebel chiefs were killed, but Mbaruk escaped. He was the boldest and most powerful among a number of Arab chiefs that united in defying the British, and compelled the Europeans in the scattered stations to take refuge in Mombasa. Their stronghold consisted of 48 stockades, which were destroyed. The troops had no difficulty in driving the Arabs out of their positions by means of artillery and war rockets, but dared not follow them into the forest. In a few weeks they reassembled near Takaungu and a third punitive expedition burned the rebel chief's camp, but could not catch him.

Uganda.—The Government of Lord Rosebery decided to limit the protectorate in the region of the sources of the Nile to Uganda proper, which was declared a British protectorate on June 19, 1894. E. J. L. Berkeley was appointed commissioner, to be assisted by a staff of civil and military officers. The import of arms and the slave trade in the neighboring countries will be checked. The public force will continue to be *Soudanese* levies.

In the beginning of 1895 Major Cunningham and Lieut. Vandeleur went to Unyoro to renew the operations against Kabarega and extend the conquests of the company about Lake Albert and the Nile. They visited the 5 forts that held the shortest road to Lake Albert and reached Hoima, the headquarters of the force of *Soudanese* that was holding the country, and thence they proceeded to the Nile, and made a reconnaissance of the river in a steel boat carrying a Maxim gun. They passed Wadelai, where Major Owen raised a British flag early in 1894, and reached Dufile, where they learned that the *Soudanese* had established a post at Rejaf, south of Lado, which was occupied by troops of the Congo State. After their return to Fort Hoima the annual expedition against Kabarega was organized. A body of troops set out from the fort to attack one of his principal chiefs, while Major Cunningham led a column from Uganda against him. There was severe fighting on the *Southern* Nile, during which Capt. Dunning was killed and Major Cunningham severely wounded. Before the end of March they drove him across the Nile into the Bakedi country, but afterward he raised a fresh army, and in the summer the operations were renewed, with the result that his forces were again beaten, and he was expelled from Unyoro. Kabarega lived on friendly terms with the white administrators of the equatorial provinces, but has been at war with the British East Africa Company since Capt. Lugard ran the line of forts through his kingdom, cutting off a portion and setting over it another chief, and garrisoned the forts with rascally *Soudanese* soldiers, who raided and terrorized Kabarega's people. Although Uganda was stated officially to be the limit of British operations, the chain of forts was moved until it included a large part of Kabarega's former kingdom, and each year fresh expeditions have been sent out for the purpose of driving him out of his territory altogether. The half of Unyoro south of the line of forts has been handed over to chiefs who are friendly to the British, but is not a part of the protectorate. There are 23 English officials in Uganda, with a military force of

1,500 *Soudanese*, who have Martini-Henry rifles and a large supply of Maxim guns.

The Belgian forces occupied Lado by virtue of the agreement made with England in 1894, which in deference to the wishes of Germany and France was rescinded in regard respectively to the strip leased by the Congo State to Great Britain for a telegraph and the lease of the Bahr-el-Gazel region to the Congo State. The Congo State was allowed to retain only the tract extending along the Nile, and for 200 miles westward from the northeastern corner of the Albert Nyanza, beyond Lado. The Congo State sent 1,000 regular soldiers with Krupp cannon and machine guns to occupy the leased territory, and massed on the nearest part of the Congo 1,500 more regulars and a large auxiliary reserve in order to be able to cope with any force that the Khalifa in Omdurman could send against them.

Zanzibar.—The area of the islands of Zanzibar and Pemba and the smaller islands constituting the dominions of the Sultan of Zanzibar after he had been deprived by England and Germany of his possessions on the mainland is about 700 square miles, and the population 200,000, of whom 100,000 live in the town of Zanzibar. Except 10,000 Arabs (the ruling race), 7,000 East Indians, 50 English, 50 Germans, and a few Americans, Greeks, Armenians, Frenchmen, Italians, and Roumanians, the people are negroes, the mass of them Sunnite Mohammedans, with some heathen and some Christians—converts of the Roman Catholic Church of England, Wesleyan, and independent missions. The Sultan or Seyyid, Hamed bin Thwain bin Said, has no power over the civil administration since the establishment of a British protectorate. On the death of the former Sultan he was forcibly installed in opposition to the choice of the Arabs, and received a civil-list pension in lieu of all other revenues. Gen. Mathews is President of the Government, under the supervision of A. H. Hardinge, the British agent and consul-general, who is also Imperial Commissioner for British East Africa. Gen. Hatch has organized a military and police force of 1,000 men.

The Sultan receives 100,000 rupees a year out of the revenue, and the remainder is applied to administrative and police purposes and to the maintenance of the harbor and public works. The receipt were estimated for 1893 at 1,068,630 rupees, of which 525,000 rupees were taxes on cloves, 217,700 rupees import duties on arms, powder, petroleum, etc., 82,000 rupees the interest on the indemnity paid by Germany, 170,000 rupees rent from the British East Africa Company, and 73,930 rupees other revenues. The total expenditure was estimated at 961,363 rupees.

For 1893 the imports were valued at £1,146,759, of which £228,016 came from the German coast, £185,483 from Arabia, £52,350 from British East Africa, £93,793 from Great Britain, and £587,217 from other countries. The value of the exports was £1,002,035. The following were the principal articles: Cloves, £138,597; ivory, £110,611; copra, £85,696; caoutchouc, £26,321; gum, £17,084; chilies, £8,365. During 1893 the number of merchant vessels that visited the port was 129, of which 45, of 58,483

tons, were British: 37, of 59,525 tons, were German; and 27, of 45,480 tons, were French.

The principal market for slaves is the Zanzibar islands, where the work on the clove plantations and all other work is done by slaves. The British representatives in Zanzibar brought pressure upon the Sultan and forced him to enter into various engagements for the suppression of the slave traffic, but during five years of British administration no new steps have been taken to check the importation of slaves into the islands, a large proportion of which come from the British protectorates on the mainland. British naval vessels continue to patrol the neighboring seas at a cost of £100,000 a year in search of slave dhows, but many escape the vigilance of the fleet, and the Arab masters who purchase the slaves in Pemba or Zanzibar are protected in their possession. Hence a demand has arisen for the removal of the scandal by the abolition of slavery in British protectorates. The average life of the slaves on the plantations is said to be only ten years, and for every one that is brought to market ten are killed in the slave raids or perish from the hardships of the journey. The Government established a vice-consulate on the island of Pemba and called for reports from the officials in Zanzibar as to the best method of abolishing slavery. The number of slaves on the islands had increased threefold in ten years, the greater number being raided in the British protectorate in the lake district and sold to British subjects in Zanzibar. The British Government itself employs the labor of slaves to coal the cruisers employed in the suppression of the slave trade, and draws the revenue from which its officials are paid from the slave labor on the clove plantations, and on the mainland great numbers of slaves are hired to keep up communications with Uganda and to perform the transport service on every expedition. The caravan porters are hired in Zanzibar at prices that are about equal to their market value. One third, and sometimes as many as two thirds of those who go up the country, die by the way. The annual importation of slaves into Zanzibar and Pemba is estimated at 6,000. The consul general at Zanzibar estimated that the immediate abolition of slavery in the islands would entail a loss of £35,000 a year in the revenue, while the sum of £200,000 would be required to compensate owners.

German East Africa.—The area of German East Africa is estimated at 363,000 square miles, and the population at 2,900,000 souls. The number of Europeans in 1894 was 750. The German East African Company, since the rebellion of the coast Arabs in 1889, when most of the stations established in the interior were ruined, has confined itself to commercial operations, leaving government and defense to the Imperial Government, which is represented by a Governor, Col. Baron von Schele. The military force on July 1, 1894, consisted of 163 European and 9 colored officers, 94 under officers, 1,743 regular troops, with 52 pieces of artillery, and 216 irregulars, besides 319 native police. The Government has granted subsidies for railroads and steamers. The budget for 1895 makes the revenue 5,520,000 marks, of which 1,750,000 marks come from customs, 400,000 marks from

the local administration, and 3,370,000 marks are contributed from the German treasury.

The value of the imports in 1893 was 7,714,822 marks; exports, 5,580,740 marks. The exportable products are coconuts, copra, sesame, corn, caoutchouc, and ivory. A railroad is being built from Tanga into the interior, on which trains were running as far as Pongwe in the beginning of 1895. The estimated cost of the line to the Victoria Nyanza and Lake Tanganyika is 30,000,000 marks, to be raised by land grants and an imperial guarantee of 3 per cent. interest secured on the customs receipts of East Africa.

Nyassaland.—On the Shire river and at the south end of Lake Nyassa are missionary stations and posts of the African Lakes Company. On the strength of their occupation of this district the English Government compelled Portugal to renounce her claims to the region now known as British Central Africa, embracing 500,000 square miles, with a population of 3,000,000 souls. The European population was about 300. The whole region was proclaimed a British protectorate on May 14, 1891, and the Barotse country and other districts were handed over to the British South Africa Company, with the exception of Nyassaland, where an administration was organized, the cost of which is shared by the Imperial Government and the British South Africa Company. The company contributed £27,000 in 1893. The town of Blantyre has a population of 6,000 natives and 100 Europeans. The Imperial Commissioner and consul general is H. H. Johnston. One quarter of the ivory product is exported from this district. Other articles exported by way of the Zambezi are India rubber, oil seeds, rhinoceros horns, hippopotamus teeth, and rice. Some of the Arab chiefs and traders are recognized by the British Government, which wages incessant war against the rest. The country has been depopulated in many places by slave raids. The armed force consists of 200 Sikhs from the Indian army and some hundreds of native police. In February, 1895, the Yao chief Kawinga, the most powerful slave-raiding chief remaining, attacked a friendly chief named Malemya and a small British garrison that guarded his town. The Yaos captured some of Manyema's people and burned their villages, but failed in an attack upon the British fort. The acting commissioner, Alfred Sharpe, set out from Zomba with 410 men to attack the hostile chief in his stronghold on a mountain plateau. They captured the place, burned the town and surrounding villages, and carried off large quantities of ivory, cattle, and copper vessels. The Yaos, who dwell in Portuguese East Africa, in the hills between Lake Nyassa and the Indian Ocean, have always been the principal purveyors of the slave trade. The British settlements on the lake were threatened later by the chief Zarifa, against whom Capt. Manning moved with a large force. Major Forbes arrived at Zomba in June to arrange about introducing the administration of the British South Africa Company in the territories north of the Zambezi and extending the trans-continental telegraph line to Lake Tanganyika.

Portuguese East Africa.—The Portuguese possessions, which once extended across the continent to the colony of Angola, were restricted

by the Anglo-Portuguese agreement of June, 1891, to the coast region and the banks of the Zambezi as far as Zumbo. This territory, having an area of 261,700 square miles and a population estimated at 1,500,000, was organized in 1891 into the state of East Africa, divided into the two provinces of Mozambique and Lourenço Marques, divided by the Zambezi river. The revenue was estimated for 1895 at 1,335,880 milreia, and expenditure at 1,555,138 milreia. The imports in 1893 were valued at 2,381,930 milreia, and the exports at 1,114,920 milreia. The principal exports are peanuts, oil seeds, caoutchouc, ivory, and sugar. The Delagoa Bay Railroad is 37 miles long. There are 230 miles of telegraph.

The Yao, whose country was devastated by drought in 1894 and 1895, carried out several slave raids upon the Nyassa, or Maganja, living on the shore of Lake Nyassa, and attacked the Portuguese fort and Roman Catholic mission at Manje.

ECUADOR, a republic in South America. The members of the Senate are elected, 2 from each of the 16 provinces, for four years, one half retiring every two years. The Deputies are elected for two years by all adult male citizens who are Catholics and are able to read and write. There are 33 Deputies, the legal ratio of representation being 1 to 30,000 inhabitants. The President is elected by the direct vote of the nation for four years, as is the Vice-President, but in a different year. Dr. Luis Coriero was elected President on June 30, 1892. In the Council of State in the beginning of 1895, the ministers were: Interior and Foreign Affairs, P. J. Lizarraburu; Justice and Education, R. Espinosa; War and Marine, Gen. J. M. Sarasti; Public Works, F. A. Marin; Attorney-General, D. J. B. Rodriguez.

Area and Population.—The area of Ecuador is estimated at 119,000 square miles, including the Galapagos Islands, but excluding territories conceded to Peru by treaty of May 2, 1890, which the Ecuadorian Congress in 1894 rejected. The civil population is computed to be 1,271,861, of whom about 100,000 are of pure, and 300,000 of mixed European descent. Including savage Indians, there are over 1,400,000 inhabitants. Quito, the capital, has a population of 80,000, and Guayaquil, the chief port, 51,000.

Finances.—The revenue for 1893 was 4,325,791 sucres, or silver dollars, of which 3,030,334 sucres were derived from import duties, 131,242 from the land tax, 337,348 from the tax on excise, 176,679 from that on rum, 20,880 from that on tobacco, 248,923 from monopolies of salt and gunpowder, 198,765 from stamps, 114,696 from excise, 17,811 from state property, 20,227 from registration, and 33,736 from other sources. The expenditures were 4,433,450 sucres, of which 18,466 sucres were for the Central Government, 30,371 for provincial administration, 123,998 for financial administration, 538,932 for the public debt, 66,487 for the salt monopoly, 127,818 for pensions, 207,656 for posts and telegraphs, 112,537 for justice, 20,241 for prisons, 385,512 for public works, 547,056 for education, 241,295 for worship and charity, 42,825 for foreign affairs, 976,923 for the army and navy, 280,057 for police, 83,574 for the collection of customs, and 578,732 for various purposes.

The foreign debt consists of obligations of the original republic of Colombia, dissolved in 1830, of which Ecuador agreed in 1854 to pay her share, which was fixed at £1,524,000 sterling. In 1867 payment of interest ceased. An arrangement was made with the British holders of the bonds in 1892, whereby the capital, including accrued interest, was scaled down to £750,000, on which the Ecuadorian Government agreed to pay 4½ per cent. interest, and ¼ of 1 per cent. sinking fund for five years, at the end of which the sinking fund should be increased to 1 per cent., and the interest to 4½ per cent. for the next five years, and 5 per cent. thereafter. A surtax of 10 per cent. on imports was imposed for the purpose of carrying out this agreement, but after three coupons had been paid the Congress in 1894 suspended payment again, the assigned duties being found insufficient, and while continuing to collect these and reserving them for the debt, the Government began to treat anew with the creditors. There is an internal debt of about 5,000,000 sucres.

The Army and Navy.—The strength of the standing army is fixed by law. There are 221 officers and 3,120 men, including 114 marines on board a cruiser, a gunboat, and an armed transport, mounting 9 guns. Including the National Guard, which is organized in 88 battalions of infantry, 11 regiments of cavalry, and 3 battalions of artillery, the effective force is 95,329 men of all ranks.

Commerce and Production.—The chief product is cacao, coffee, sugar, and rice coming next. Gold is mined extensively, and silver, copper, lead, iron, coal, and petroleum are found. The forest products are also important. The principal imports are cotton and other textiles and iron goods. The total value of the imports in 1893 was 10,052,163 sucres. The value of the exports amounted to 14,052,514 sucres. The principal ones were: Cacao, 7,784,000 sucres; coffee, 978,000 sucres; vegetable ivory, 637,000 sucres; India rubber, 235,000 sucres; straw hats, 160,000 sucres; hides, 125,000 sucres.

The commercial intercourse with leading countries is shown in the following table for 1893 giving the values of the imports and exports:

COUNTRIES.	Imports.	Exports.
France.....	\$2,042,512	\$3,092,625
Great Britain.....	1,055,604	1,796,562
Germany.....	1,067,969	2,318,997
United States.....	2,400,169	1,690,370
Spain.....	397,649	1,300,397
Peru.....	626,972	397,592
Chili.....	672,442	672,521
Colombia.....	29,412	121,594

Navigation.—The total number of vessels that called at the port of Guayaquil during 1893 was 1,707, of 267,552 tons, of which 1,521, of 23,720 tons, were Ecuadorian sailing craft. There were 167 steamers, of 232,767 tons, of which 81, of 100,483 tons, were British and the rest of other foreign nationalities. American-built and Ecuadorian steamboats navigate the numerous rivers.

Communications.—A company has built a railroad from Duran to Chimbo, a distance of 63 miles. Because it failed to extend it within the time set, the Government annulled the con-

cession and seized the road, and has since opened negotiations with a French syndicate that offered to continue the line to Riobamba. There are 1,242 miles of telegraph lines. The post office in 1893 forwarded 1,802,024 letters and 6,338,215 pieces of printed matter and packets in the external service, and in the internal service carried 3,024,064 letters, postal cards, circulars, etc.

Revolution.—When the Japanese Government wished to strengthen its navy by acquiring the fast and well-armed protected cruiser "Esmeralda" the Chilian authorities were willing to dispose of the vessel for a good price, but not directly to Japan while that country was at war with a friendly power. Secret arrangements were made therefore by which Ecuador acted or was made to appear as intermediary in the transaction, ostensibly buying the vessel and afterward selling to Japan. The people of Ecuador thought this shameful and suspected that officials had thus compromised the honor of the republic only to enrich themselves.

The "Esmeralda" was sold to Japan in November, 1894, for more than \$1,000,000. She sailed under the Ecuadorian flag to the Galapagos Islands. There her name was changed to the "Yalu," and she proceeded to Yokohama, where she arrived on Feb. 6, 1895. President Montt, of Chili, declared that he had sold the vessel to the Ecuadorian Government. President Cordero and his ministers denied that they had purchased a vessel from Chili.

The ministry ordered an investigation to appease popular indignation, and removed Gov. Caamaño, of Guayaquil, Consul-General Modesto Solórzano in New York, and the consul at Valparaiso. Gen. Aloy Alfaro, chief of the Radical party, issued in the beginning of April from his place of exile in Nicaragua a proclamation saying that the only way to set Ecuador right before other nations was to depose President Cordero and all who were responsible. The students and the citizens in Guayaquil and other towns issued protests against the Administration. The followers of Alfaro took up arms in the province of Carchi, and Gen. Sarasti went to suppress the rising. The revolt spread, and the rebels took possession of the town of Ibarra, on the Colombian borders, putting to flight the Government garrison. On April 24 President Cordero resigned, and Vicente Salazar, the Vice-President, took his place. The Cabinet was reorganized, Luis Salvador becoming Minister of the Interior, Dr. Nuñez Minister of Finance, and Robert Espinosa Minister of Justice, while Gen. Sarasti remained Minister of War.

Eloy Alfaro was the leader of the attempted revolutions of 1884 and 1885. The Government since then has been in the hands of Moderate Liberals or Independents, who have temporized with the Conservatives and failed to satisfy the demand of the Radicals that the Church shall be stripped of public powers and deprived of public revenues. Alfaro and his supporters were cruelly repressed after their former uprising, and the country finally settled down under a policy of compromise. Cordero was a member of the Church party who made a bargain, it was said, with a section of the Liberals in order to gain the presidency. The ideas of the Radicals

have of late gained greater currency. Since Cordero's irregular election they have watched for a favorable opportunity to grasp at the reins of power, and when the "Esmeralda" scandal arose to discredit the Administration they were already prepared for a revolutionary campaign.

The revolution soon became formidable. The Government vainly attempted to check it by suppressing the newspapers and banishing their editors. The rebels took the maritime town of Esmeralda, blowing up the barracks with dynamite. They had 1,000 men under arms in that city early in May, and the Government attempted to recapture it from the land and the sea without success. Gen. Bowen led another uprising in Babahoyo, which was captured after a stiff fight in which the Government lost 49 killed, 87 wounded, and 32 prisoners. Several regiments of Government troops went over to the insurgents. In Cañar women delivered political prisoners from jail. Col. Zenon Zebando and Col. Antonio García captured Portoviejo with its well-supplied arsenal. At Machala 2,000 stands of arms were captured. The gunboat "Sucre" was blown up and 14 men were killed. A plot to seize the gunboat "Cotopaxi" was frustrated. The United States steamer "Ranger" was sent to Esmeralda to watch over the property of Americans, who are largely interested in the silver mines of Ecuador. After the revolt of the province of Ora and the fall of Machala, Gen. Rejinaldo Flores, commanding the troops that were massed at Guayaquil to recapture Esmeralda and suppress the rebellion, resorted to measures so tyrannical and cruel—flogging political prisoners and putting the whole population at work upon the fortifications—that Gen. Sarasti wished to supersede him, and sent his son to take over the command, but Flores would not give it up. Minister of Finance Nuñez resigned. The severity and tyranny of Flores, the man who was responsible for the sacking of the *hacienda* of Julio Flores, an American, during the former revolution, alienated most of the friends of the Government except the Conservatives of the central provinces, who were determined to resist to the last a Radical *régime*. On May 25 Gen. Flores had difficulty in suppressing a mutiny in the garrison of Guayaquil. Of the officers who led it, many were shot and others thrown into prison. A few days later that city was in the hands of the revolutionists, and Gen. Flores was a fugitive. It was captured, after a siege of three days, on June 6, by the army of Gen. Bowen, which had not to fight hard; for police and soldiers within assisted the assailants. Only 40 persons were killed or wounded in the engagement. The revolution was victorious now in 11 of the provinces. Besides Esmeralda and Guayaquil, the rebels held also the ports of Bahía and Manta. The Government possessed still only the interior provinces of Pichincha, Cañar, Azuay, and Loja. An insurrection occurred in Quito, and was suppressed after desperate fighting in the streets. Gen. Eloy Alfaro was proclaimed Provisional President on June 6. The Government forces were collected at Quito for a last stand. The Government asked for military aid from Colombia, but against this

Gen. Sarasti, who was himself closely invested at Babamba, made a protest.

Eloy Alfaro arrived at Guayaquil, and on June 19 organized a Cabinet composed as follows: Minister of the Interior and of Foreign Affairs, Luis Felipe Carbo; Minister of Agriculture and Public Works, Lizardo Garcia; Minister of War and Marine, Cornelio Vernaza. The Provisional President sent Dr. Rafael Portas and others as peace commissioners to Quito to try to arrange terms for the capitulation of the Government forces and the transfer of the political power and offices without further bloodshed. At the same time an army of 3,000 men was got ready to march upon the capital, while 4,000 were equipped as a reserve. Missionary priests and nuns, some of them Americans, in Cabalets and other places complained of being maltreated and compelled to flee from the country by the revolutionists, who asserted that Bishop Schumaker, the head of the missionaries, raised a force of 400 men to oppose them. The Provisional Government banished many persons who were counted among its partisans, on the ground that they were engaged in a conspiracy to restore to power the former dictator José Yantemilla. The Government at Quito refused to treat with the representatives of Alfaro, who set out in the middle of July upon his march into the interior. Some of the soldiers and officers of Gen. Sarasti who prepared to oppose Alfaro's advance deserted and joined the rebels, who, when they reached Chimbo, received valuable recruits from among the Indians of the country. Gen. Vergaza, who conducted a second column by way of Babahoyo, encountered and defeated 600 of Gen. Sarasti's army at San Miguel de Chimbo. After Vergaza's force joined Gen. Alfaro's column of 1,500 men they advanced along the main road to Quito. Guaranda was occupied on Aug. 6 after a fight in which the Government lost 45 killed and 20 wounded. Gen. Sarasti concentrated his army, numbering over 1,000 men, at Riobamba, which place, strongly fortified and defended by artillery, the Alfaristas must take before they could continue their advance. Alfaro's army, re-enforced by several thousand Indian warriors, captured this position after a desperate battle in which over 600 are said to have fallen, on both sides. Sarasti's broken army retreated to Quito, leaving 100 prisoners, 8 field pieces, 2 Gatling guns, and 800 rifles in the enemy's hands. The prisoners of war, according to Gen. Alfaro's custom, were released.

Other revolutionary columns were mobilized until six of them were advancing from the coast and operating in the south. When Cuenca, capital of Azuay, was taken by the Alfaristas after a siege and a severe battle, the whole southern part of Ecuador was theirs. Gen. Salazar at Quito had great difficulty in maintaining his authority over the population of the capital. Many citizens, including some women, were thrown into jail. When Alfaro's column approached Salazar took refuge in the Peruvian legation, and his ministers hurriedly fled. Alban Mestanza assumed authority as civil and military chief pending the establishment of the new Government, the Government forces having evacuated the city after the officials retired. Alfaro's troops were

received with demonstrations of joy when they arrived on Aug. 27 and encamped before the gates of the capital. The chief of the revolution made his triumphal entry into Quito on Sept. 1.

Gen. Alfaro's success was not complete until he consolidated his power by establishing a working administration in the different provinces. In some places the adherents of the Clerical régime were still active and defiant, and when their opposition abated intriguing rivals sprang up among the supporters of the revolution. In Ibarra, whither the members of the late Government had fled, Gen. Rivadeneira made an attempt to organize a counter-revolution and impose his rule in the province of Imbabura. In Guayaquil a plot against Alfaro was hatched, for participation in which Gen. Bowen and Gen. Trivino were dismissed from the army. An attempt to assassinate the new President in his palace was frustrated on Sept. 28. Gen. Alfaro was formally inaugurated as Supreme Executive Chief of the republic on Oct. 28, and on Nov. 4 he announced his Cabinet appointments as follows: Minister of the Interior, José Luis Tamayo; Minister of Foreign Affairs, Ignacio Robles; Minister of Finance, Lizardo Garcia; Minister of War, Gen. Morales; Minister of Public Works, David Morla; Minister of Public Instruction, Victor Gorgotena.

EGYPT, a principality in northern Africa, tributary to Turkey. The Government is an absolute monarchy of the Mohammedan type, but the throne is hereditary and passes by right of primogeniture. The reigning sovereign, called the Khedive, is Abbas Hilmi, born July 14, 1874, who came to the throne on the death of his father, Mehemet Tewfik, Jan. 7, 1892. On Feb. 19, 1895, he married Ikbal Hanem, a slave girl, who bore him a daughter. Since the intervention of Great Britain for the suppression of the military revolt of 1892 the country has been occupied by a British army, and since January, 1893, the Khedive appoints an English financial adviser, who has a seat in the Council of Ministers and power to veto any financial measure. At the beginning of the English control an organic decree was promulgated, May 1, 1883, establishing two popular elective bodies to take the place of the defunct Chamber of Notables. Of these the Legislative Council, composed in almost equal parts of nominees of the Government, mostly Cairo officials, and members elected in the provinces by popular suffrage, usually large landowners, examines all general laws, though the Government is not obliged to act upon its recommendations. The Legislative Assembly, which meets biennially, has the right to veto any new direct personal or land tax.

The Cabinet of the Khedive in the beginning of 1895 consisted of the following ministers: President of the Council and Minister of the Interior, Nubar Pasha; Minister of Finance, Mazlum Pasha; Minister of Public Works and Minister of Education, Fakhry Pasha; Minister of Justice, Ibrahim Fuad Pasha; Minister of War and Marine, Mustapha Fehmi Pasha; Minister of Foreign Affairs, Boutros Ghali. The English financial adviser to the Khedive and diplomatic agent is Lord Cromer.

Area and Population.—The area of Egypt within the present limits is about 385,000 square

miles, of which nearly all except 12,976 miles forming the valley and delta of the Nile is arid and is populated by nomads. The population in 1882 was 6,817,263, of whom 6,480,600 were sedentary Egyptians, 245,779 were nomads, and 90,886 were foreigners. The total population was divided as to sex into 3,401,498 males and 3,415,767 females. The population of Cairo, the capital, was 368,108; of Alexandria, the chief port, 208,753.

Finances.—The budget for 1895 makes the total revenue £ E. 10,260,000 (1 Egyptian lira or pound = \$4.99), of which £ E. 4,870,000 are derived from the land tax, date tax, etc., £ E. 1,700,000 from railroads, £ E. 1,650,000 from customs and tobacco duties, £ E. 380,000 from judicial fees, etc., £ E. 200,000 from *octrois*, £ E. 170,000 from salt and natron, £ E. 130,000 from port dues of Alexandria, £ E. 130,000 from urban taxes, £ E. 103,000 from lighthouse dues, £ E. 100,000 from the post office, £ E. 98,000 from fisheries, £ E. 94,000 from postal boats, £ E. 90,000 from payments for exemption from military service, £ E. 86,000 from rents of Government property, £ E. 78,000 from navigation dues, £ E. 55,000 from the pension fund, £ E. 42,000 from telegraphs, and £ E. 284,000 from other sources.

The expenditures are estimated in the budget at £ E. 9,600,000, of which £ E. 3,770,837 are for the public debt, £ E. 831,465 for railroads, £ E. 775,650 for public works, £ E. 750,843 for police, prisons, and the army of occupation, £ E. 665,041 for the Turkish tribute, £ E. 430,000 for pensions, £ E. 380,162 for justice, £ E. 320,619 for administration of the provinces, £ E. 250,000 for suppression of the *corvée*, £ E. 149,222 for administration of the customs, £ E. 119,792 for the administration of Suakin, £ E. 119,715 for financial administration, £ E. 111,707 for the interior, £ E. 105,000 for public instruction, £ E. 100,000 for the civil list of the Khedive, £ E. 97,927 for the civil lists of the khedivial family, £ E. 95,743 for the post office, £ E. 84,657 for postal boats, £ E. 55,934 for the private Cabinet of the Khedive, £ E. 46,278 for salt and natron, £ E. 40,200 for telegraphs, £ E. 40,000 for the sanitation of Cairo, £ E. 33,327 for collection of *octrois*, £ E. 26,850 for lighthouses, £ E. 23,930 for the Council of Ministers and foreign affairs, £ E. 23,000 for the port of Alexandria, and £ E. 152,092 for other expenses.

The public debt on Jan. 1, 1895, amounted to £104,406,890 sterling, of which £55,974,820, constituting the unified debt, bears interest at 4 per cent., £29,393,580 of privileged debt pays 3½ per cent., the guaranteed loan of £8,766,200 pays 3 per cent., £6,814,720 outstanding of the Daira Sanieh loan pays 4 per cent., and the converted Domains loan, amounting to £3,457,570, bears interest at 4½ per cent. The debt charges for 1895 were £2,239,463 for the unified debt, £1,029,000 for the privileged debt, £315,000 for the guaranteed loan, £272,500 for the Daira Sanieh loan, £146,950 for the Domains loan, £34,871 for the Daira Khawass, the annual payment to the loan commissioners, and the Moukabalah annuity of £153,846, which runs till 1930. The Domains and Daira estates yielded a surplus in 1894 of £ E. 730,265, which was turned over to the Caisse de la Dette and its reserve fund and to the special reserve fund of the Government.

These funds amounted in the beginning of 1893 to £ E. 3,554,424.

Military Forces.—The new Egyptian army, organized after the disbandment of the old force by Sir Evelyn Wood, an English general who received the Egyptian title of sirdar, has a total strength of 13,000 men, commanded by about 60 British officers. The present sirdar is Brig.-Gen. Horatio Herbert Kitchener. Every Egyptian, excepting ecclesiastics, professors, and students, is liable to serve in the army, but may purchase exemption by paying £ E. 20.

The police force numbers about 130 officers, 240 employees, and 5,000 men.

British troops have occupied Egypt since 1882. In 1894 the army of occupation, commanded by Maj.-Gen. Forestier Walker, consisted of 4,057 infantry, 519 cavalry, 166 field artillery, 155 garrison artillery, 108 engineers, 66 train, and 205 staff officers and administrative troops; total, 5,276 of all ranks.

Commerce and Production.—Of the total area of Upper and Lower Egypt, about 8,000,000 feddans (1 feddan = 1.038 acre), 5,022,000 feddans were under cultivation in 1891, and of this area 1,108,000 feddans produced double crops—cereals in the spring and cotton, sugar, or rice in the autumn. The area under cotton in 1892 was 864,000 feddans, yielding 4,987,500 kantars, or 493,907,000 pounds. The area under wheat in 1891 was 1,215,841 feddans; under corn and durrah, 1,530,983; under beans, 643,751; under clover, 820,263; under barley, 460,330; under rice, 167,164; under sugar cane, 64,539. Other crops are lentils, fennugreek, potatoes, onions, chick-peas, melons, peas, castor beans, indigo, flax, henna, and sesame.

The total value of the imports of merchandise in 1893 was £ E. 8,718,735, and of the exports £ E. 12,789,687. The imports of precious metals were £ E. 2,946,674, and the exports £ E. 3,517,152. The commercial intercourse with foreign countries in 1893 is shown in the following table:

COUNTRIES.	Imports.	Exports.
Great Britain.....	£ E. 2,688,121	£ E. 7,242,455
Turkey.....	1,510,161	425,589
Russia.....	887,088	1,746,602
France.....	596,560	876,594
Austria-Hungary.....	720,861	467,687
Italy.....	831,176	584,249
Germany.....	118,244	899,791
British colonies in the East.....	597,011	62,688
Belgium.....	230,450	65,064
America.....	87,598	247,084
Spain.....	298,805
British Mediterranean colonies.....	119,222	18,236
China and the far East.....	84,797	1,201
Greece.....	49,971	10,370
French Mediterranean colonies.....	38,506	24,540
Morocco.....	87,838	1,219
Red Sea ports.....	4,576	26,809
Persia.....	29,562
Other countries.....	805,580	24,292
Total.....	£ E. 8,294,558	£ E. 12,789,687

The values of the principal exports were: Cotton, £ E. 8,525,974; cotton seed, £ E. 1,840,357; sugar, £ E. 760,793; beans, £ E. 687,958; onions, £ E. 146,068; rice, £ E. 124,525; skins, £ E. 93,743; wheat, £ E. 83,952; wool, £ E. 40,150; lentils, £ E. 23,726. The chief imports were: Cotton goods, £ E. 1,320,838; silk, wool-

wool, linen, and other textile goods, £ E. 1,150,125; timber, £ E. 439,482; tobacco, £ E. 424,177; coal, £ E. 404,847; apparel and hosiery, £ E. 356,903; iron and steel goods, £ E. 342,007; wheat and flour, £ E. 337,815; wine, beer, and spirits, £ E. 309,697; coffee, £ E. 293,418; petroleum and oils, £ E. 264,364; fruits, fresh and preserved, £ E. 242,010; animals, £ E. 187,606; machinery, £ E. 152,065; rice, £ E. 124,525.

Navigation.—The number of vessels entered at the port of Alexandria during 1893 was 2,271, of 2,000,060 tons; cleared, 2,233, of 2,025,433 tons. Of the vessels entered, 596, of 864,388 tons, were British; 123, of 273,831 tons, French; 984, of 240,878 tons, Turkish; 132, of 200,533 tons, Italian; 141, of 194,808 tons, Austrian; 78, of 128,048 tons, Russian; 39, of 45,507 tons, Norwegian and Swedish; 26, of 36,749 tons, German; 157, of 25,800 tons, Greek; and 46, of 12,659 tons, of other nationalities. The arrivals declared at Damietta and Rosetta and at Port Said and Suez were 6,988, of 7,922,652 tons, and the clearances were 7,053 in number; tonnage, 7,919,634.

Communications.—The railroads in 1894 had a total length of 1,255 miles. During 1893 there were 9,301,081 passengers transported, and 2,118,002 metric tons of freight; the receipts were £ E. 1,660,000 and expenses £ E. 717,880. The railroad through the Nile valley, which has its present terminus at Keneh, is being continued to Assouan, and will be completed in 1897, the entire distance from Alexandria to the First Cataract being over 700 miles. The length of the Government telegraphs in the beginning of 1893 was 1,922 miles, with 6,763 miles of wire. The number of internal messages in 1892 was 1,722,000.

The post office in 1893 carried 9,570,000 internal and 3,950,600 international letters and postal cards, and 3,580,000 newspapers, etc., in the internal and 2,169,400 in the international service.

Suez Canal.—The number of vessels that passed through the canal in 1893 was 3,341, of 10,753,798 tons, paying in tolls £2,826,694 sterling. The number of passengers was 180,432. Of the vessels, 2,405, of 7,977,728 gross tons, were British; 272, of 798,929 tons, German; 190, of 702,634 tons, French; 178, of 443,147 tons, Dutch; 71, of 251,468 tons, Austrian; 67, of 183,492 tons, Italian; 50, of 119,616 tons, Norwegian; 29, of 100,706 tons, Spanish; 24, of 82,767 tons, Russian; 34, of 55,407 tons, Turkish; 19, of 17,898 tons, Portuguese; 5, of 7,466 tons, Egyptian; 3, of 6,526 tons, American; 1, of 2,847 tons, Japanese; 1, of 2,546 tons, Belgian. The net profits for 1893 were 40,615,536 francs. The share and loan capital on Jan. 1, 1894, amounted to 452,147,402 francs, not including the 100,000 founders' shares, which receive 10 per cent. of the surplus profits over and above 5 per cent. interest on the shares, and in 1892 did receive 4,061,553 francs.

In 1894 the gross receipts amounted to 76,121,000 francs and the net profits to 41,121,000 francs. During the year 3,352 ships passed through the canal, having an aggregate burden of 8,089,175 tons. The number of passengers was 168,003. There were 45 passages made by 11 ships carrying petroleum in bulk. The aver-

age time of transit was nineteen hours, fifty-five minutes, against twenty hours, forty-five minutes in 1893.

Political Affairs.—After securing in the Nubar ministry a subservient instrument for all his designs, Lord Cromer made no pretense of considering the Khedive's wishes or susceptibilities or of conciliating native opinion. The failure of most of the British experiments in reforming the administration had produced such a settled antipathy to the English that they no longer strove to reconcile the people to their rule. J. F. Gorst, on being appointed adviser to the Ministry of the Interior, immediately prepared a project for the regulation of local government that deprived the village sheiks of real authority and transformed the *omdehs* into agents of the English policy. The Legislative Council adjourned so as to avoid discussing this unpopular measure.

Manifestations of popular discontent were not unwelcome to the British guardians, because such exhibitions of hostile feeling made it appear necessary for the army of occupation to remain and impossible for Egypt to govern itself without danger to the rights and property of Europeans. The attitude of the common people toward the British became dangerously aggressive and defiant early in 1895. A mob in Alexandria assaulted some marines of the war ship "Scout" on Feb. 8. For this 7 natives were sentenced to the extreme punishment allowed by the law. Sir John Scott, the judicial adviser of the Government, immediately drew up a new law making the penalty more severe for attacks by bands upon Europeans. Another decree created a new tribunal with power to deal summarily with native offenses against English officers, soldiers, or sailors. This court is armed with powers of life and death and is independent of all restrictions of the code. It will pronounce immediate judgment, from which there is no appeal, but will only meet upon the demand of the general commanding the British army of occupation. Since punishments have become frequent and been rendered more severe for exhibitions of the popular dislike for the British and condemnations more numerous for all manner of offenses, the natives often feel the substitution of imprisonment for the old practice of flogging to be a hardship, and even the British officials sometimes regretted having introduced this humanitarian reform. Some men who hooted at an English military funeral procession were sentenced to a year's imprisonment. Penalties of that kind not only add greatly to the cost of prison administration, but deprive families of the means of subsistence.

The Legislative Council, which had adjourned till April, was summoned peremptorily on Feb. 22 to act upon the project for the reorganization of the internal administration and Sir John Scott's measure for preventing mob attacks upon Europeans. Mr. Gorst's project was adopted with amendments securing greater independence of the village authorities from the provincial as well as from the central executive. The *omdeh* is the head man of the village and the sheiks are his deputies. Each sheik has authority over a part of the inhabitants in each village, they having the right to choose under

what sheik they wish to be. The sheik is responsible to the omdeh for the behavior of his followers, and the omdeh is responsible to the Government for all that happens in the village. Commissions were appointed under the new law to investigate the village officials throughout Egypt, remove incompetent and dishonest sheiks and omdehs, and reorganize the whole local administration. These commissions abolished 366 villages, and in 3,572 that were preserved they dismissed 714 omdehs and 1,947 sheiks and, besides replacing the latter, appointed 2,968 additional sheiks.

The English authorities gave offense to the Khedive and to the Egyptian public by refusing the last request of Ismail Pasha, the moribund ex-Khedive, that he might come home to Egypt to die.

M. Legrelle, the Procurator-General, was displaced in March after twelve years of service in consequence of irreconcilable differences with Sir John Scott, who desires to supplant the French code and rules of procedure and to restrict the functions of the parquet to those of a public prosecutor. A native lawyer was appointed to the office and more summary forms of procedure were introduced. Sir John Scott formulated new regulations making the parquet subject to the inspection of the committee of judicial surveillance, directing the mudirs to investigate crimes, depriving the parquet of the right to instruct the criminal tribunals and that of prosecuting officials without orders from the Ministry of Justice, and transferring to it all the functions previously discharged by the *juges d'instruction*.

Ismail Bey Sabry, vice-president of the native court of appeals, was appointed procurator-general, and another native jurist, Zewar Bey, was made advocate-general. The Legislative Council after closing its session was for the second time ordered to reassemble in order that a measure for the rapid disposal of criminal cases should be legalized. Other changes in the administration of the criminal laws were important. Not only were the courts placed under English inspection, but English inspectors under the new adviser to the Ministry of the Interior guided the police administration in all the provinces, the central police bureau in Cairo being abolished and the provincial police placed under the mudirs. A ticket-of-leave system, like that of England, has been adopted for Egyptian prisons. For juvenile offenders reformatories have been established. The natives complained that the sure and stable administration of justice under the mixed codes, based upon the laws and procedure accepted in France, Italy, Belgium, and other European states, was disorganized, first by the institution in 1891 of the judicial committee of control having power to censure and to procure the removal of judges of the native tribunals, and now still further by the enforced retirement of the procurator-general and by the suppression of all independence of the officials of the judicial order acting as investigators and prosecutors of crime and the transfer of their powers to the provincial prefects, leaving them merely the task of supporting as advocates the prosecutions which the administrative officials may arbitrarily ordain,

without having to observe any of the laws guaranteeing the liberty and honor of citizens. In a petition to the French Chamber a large number of Egyptians claimed the protection of the public law of Europe against the adjudication by the disorganized native tribunals of questions of real property and of offenses against police regulations, which under the judicial reform of 1875, guaranteed by treaty and binding till Feb., 1890, are subject to the jurisdiction of the mixed tribunals. Threatened with the interference of the administration with the course of justice in the native tribunals since prosecutions have been transferred from independent procurators into the hands of mudirs and subprefects, they preferred to have cases decided according to the fixed principles of the European civil law by the reform courts of mixed jurisdiction. An Egyptian committee was organized in France to agitate in favor of a common resolution of the great powers to guarantee the neutrality of Egypt and the entire Nile basin, and thus afford the British Government an honorable ground for the evacuation of Egypt, which was now admittedly of no strategic value to England. The Suez Canal, open in time of peace, but now at the mercy of any event in war, should be preserved as a highway of commerce by neutralization. The French merchants in Egypt petitioned the French Chamber to record a protest against the prohibition of all trade between Egypt and the Soudan that has been maintained since the British occupation, although the Soudanese try to get their produce into Egypt and the Egyptians to circumvent the embargo and renew the long interrupted commercial intercourse with the Soudan.

The English administrators have desired to apply the reserves accumulated in the treasury, amounting to £4,230,000, to administrative reforms, public works, and the relief of taxation, but this money belonged to the bondholders under an international engagement which the French Government refused to cancel. For the relief of agricultural distress caused by the sudden fall of 25 per cent. in the value of the cotton crop and the depression in the prices of sugar and cereals, the Government initiated a general reassessment of tax values in accordance with present rents in order to equalize the incidence of the land tax. The new classification makes the large proprietors pay more taxes and lightens the burden resting upon the small landowners. The aggregate revenue of £4,900,000 sterling from 5,436,000 acres of cultivated land was not to be increased nor the maximum rate of 32s. 5d. an acre to be exceeded. The collection of some of the taxes had been postponed on account of the low price of cotton. The Commission of the Public Debt was disposed at first to object to the guarantee of 3½ per cent. interest on £365,000 of bonds for the Keneh-Assouan Railway: the bonds and the contract were then taken by the Berlin Handelsgesellschaft. The Council of Ministers decided to bring the Wakfs under the supervision of the Ministry of Finance by directing the accounts of these religious and charitable endowments to be audited by that department. The Legislative Council, objecting to such intervention in Mohammedan matters, proposed that the committee of Wakfs should

submit its accounts direct to the Khedive. Conscription for the army was extended to Cairo, Alexandria, and the other towns hitherto exempted by custom. This measure is expected to increase the receipts of the Ministry of War by a considerable sum that citizens of the municipalities will pay for exemption from military service. The price for exemption has been reduced to £ E. 20. This purchases exemption from the liability to serve, and must be paid before the drawing. Only 2 per cent. of the persons summoned have to join the colors, yet so intense is the aversion to military service that even the fellahs who can pay the tax do so rather than run the chance of conscription.

The judicial adviser framed a new antislavery convention. Trial by court-martial is maintained at Suakin and in the frontier province. The buyer of slaves is made distinctly liable to punishment not less than the seller, and a new court is created for the purpose of trying cases in the districts not under martial law, consisting of 5 judges of the native court of appeal, of whom 2 shall be Europeans. The decisions of this court are final.

The recalcitrant attitude of the young Khedive and his patriotic friends toward the Anglo-Indian methods employed for the subjugation of Egypt by its present masters is reflected in recent transactions of the Legislative Council. This body made no attempt to exercise its limited authority so long as the Egyptian Government followed obediently the dictation of the English advisers. When Riaz Pasha at length rebelled the Council took courage, and by its strictures on the budget of 1894 Sir Elwin Palmer, the financial adviser, attempted to rebut the statement that the private indebtedness of the landowners had risen from £ E. 12,000,000 in 1881 to £ E. 20,000,000 in 1891 by a compilation of the mortgages recorded in the courts showing that their sum is only £ E. 7,333,300 and that the number of acres mortgaged is 395,600, not 1,300,000. When Ali Pasha Sherif, who was convicted of a violation of the antislavery law, resigned the presidency of the Legislative Council, Omer Pasha Loufi was elected his successor. In the budget report for 1895 the Council called upon the Government to reduce the land tax by £1,000,000 and save the people of Egypt, who are being crushed under an ever-increasing load of indebtedness, from sinking into the state of mere hired laborers on the land which they own, but of which they are rapidly being dispossessed.

In a commercial convention with Greece, signed March 21, permission was given to import Greek tobacco, which hitherto has been prohibited, the capitulations being relaxed so that Egyptian officers can search Greek vessels and domiciles for smuggled goods.

The Soudan.—The Khalifa Abdullah, who succeeded the Mahdi Mohammed Achmet as ruler of the empire which the latter welded out of the Soudanese provinces of Egypt, preserves the strict Mohammedan character of the state, but no longer aims to carry out the religious mission of conquest, for he has great difficulty in retaining his authority over the tribes that he pretends to rule. The Khalifa, who was once lieutenant of the Mahdi, and commander of the Bag-

gara military force that established and maintained his empire, now represents the domination of that Arab tribe over the mixed negro and Arab races, who feel the rule of the Baggaras to be hard, but not so oppressive and rapacious as was that of the Egyptians. The country is less prosperous than it was under Egyptian rule, for the Khalifa has not known how to found a civil government that will be respected, and all outside commerce has been shut off, except the clandestine trade in slaves. The Soudanese dervishes formerly raided the region of the Welle and the country between the Nile and the Congo. The supply of slaves is now nearly stopped by the military operations of the Congo State, which, under an agreement with Great Britain, has extended its outposts to the Nile. The diminished power of the Khalifa might be overthrown, the slave trade in this region crushed out, and the Soudan again opened to commerce by sending a small European military force into the country. This has not been done, owing to political complications. Great Britain claims the whole Nile basin as its sphere of influence, irrespective of its engagements to withdraw from Egypt as soon as that country is able to govern itself, and has persistently refused to allow the Egyptian Government to attempt to reconquer the provinces which it evacuated at the dictation of the English. The French Government refuses to recognize the claims of Great Britain in the Nile basin, but these have been recognized by the German, Italian, and Congo governments. The French contend that all the countries that were formerly held by Egypt under the suzerainty of Turkey are still Egyptian in international law, and a part of the Turkish Empire. The British were alarmed in 1895 lest French expeditions from the Congo and the Niger should penetrate into the Bahr-el-Gazel province and occupy it as guardians of the rights of the Sultan. The recent activity of the French in the Ubangi country influenced the British Government to send expeditions to Lake Albert and the upper Nile, and to undertake the construction of the Uganda Railroad.

Nearly all the Europeans, former officials of the Egyptian Government and missionaries, who were held in captivity by the Khalifa, have escaped and returned to Europe. Father Bonomi got away in 1885; Father Ohrwahler, with 2 Italian nuns, in 1891; Father Rosignoli in November, 1894; and, finally, Slatin Bey, the last of Gen. Gordon's lieutenants, in February, 1895. The Europeans were latterly allowed to earn their living by working at whatever handicrafts they knew in Omdurman. Slatin Bey was at times kept in prison, loaded with chains; at other times was treated with distinction and called into counsel by the Khalifa. He made eight attempts to escape before his wardens finally relaxed their vigilance and suffered him to depart. When the Austrian officer left, the Khalifa had 12,000 fighting dervishes, under Osman Digma, encamped on the Atbara river, threatening the Italians at Kassala. His military power was still unbroken, the Baggaras, of whom he is one, remaining faithful, and his political and religious power at Omdurman and throughout the southern provinces was still great, but was waning.

ELKS, BENEVOLENT AND PROTECTIVE ORDER OF, a charitable and benevolent organization founded in New York city in 1868. The object of the order is to aid and protect its members and their families, and to promote friendship and social intercourse. In the beginning it was composed of a few gentlemen of the theatrical profession, drawn together for social intercourse. It has now developed into a powerful organization of 30,000 members, with lodges in more than 250 cities of the United States. While members of the theatrical profession are numerous and prominent in the order, yet its rolls contain the names of many in other professions and occupations. Only one lodge is permitted in any town or city. This is to prevent the rivalry, conflict, and jealousy that sometimes embarrass secret societies. The initiation fee varies from \$15 to \$100 in lodges in the various cities. The average dues are \$6 a year. The order is not beneficial, but it is claimed to expend more in unostentatious charity than any other in the world. The amount averages \$10 a week to those who are in distress, but the sum is usually limited by the needs of the sufferer. There are no ranks, titles, or emoluments in the order. All Elks have equal rights under their laws. To join the order of Elks, the applicant must be a man of good health, must be twenty-one years of age, must believe in a Supreme Being, must be a citizen of the United States, and must have some honorable occupation or visible means of support. Another body, which the Grand Lodge, at its session in Jamestown, N. Y., declared to be "unauthorized, illegal, and revolutionary," held its convention at Atlantic City in 1894; but the two wings of the order are now practically united.

ENGINEERING. Ship Canals.—On June 21 the Emperor of Germany, attended by an immense fleet of war ships representing all the maritime nations of the world, officially opened the North Sea and Baltic Ship Canal. Since first the nations of northern Europe began to build ships, study navigation, and realize the importance of short cuts by water from sea to sea the desirability of a canal across the base of the Danish peninsula has been obvious. A beginning was made in 1398, and a narrow canal was made, following natural watercourses and serving for the passage of small craft. This was in use until 1784, when the Eider Canal was opened from a point near the eastern end of the present canal to Rendsburg (22 miles), the remainder of the distance being by way of Eider river to the North Sea. This canal was used annually by about 4,000 vessels, but the 6 locks carried only 10 feet of water, so that vessels of any considerable size were still obliged to make the dangerous passage around Denmark. On the conclusion of the Schleswig-Holstein complication, in 1865, Bismarck, foreseeing the coming necessities of commerce and of war, secured a concession of land from the principality sufficient for the construction of such a canal as has now been completed. The attainment of German unity a few years later further emphasized the necessity of such a canal, and in 1887 Kaiser Wilhelm I officially began the work. The canal as completed is a little more than 61 miles long, and, for the easterly part of

its course, follows the line of the old Eider Canal, then bending southward till it enters the lower Elbe where there is a navigable depth of about 40 feet. Theoretically, the whole canal is at the Baltic-Sea level, which is practically unaffected by the tides; but the rise and fall of the North Sea at the mouth of the Elbe averages about 20 (7) feet, so that a system of tidal locks and gates has been established at Brunsbüttel, where the canal proper debouches into the river. At Holteneau, the Baltic terminus, storm gates only are required, which will be closed whenever necessary, because of violent gales from the east. This occurs, according to observations, on an average of twenty-five days in a year, but, even when it is necessary to keep the gates closed from hour to hour, they can be opened for intervals of a few minutes, sufficient to pass vessels into the canal. The tidal locks at Brunsbüttel, on the contrary, will be habitually kept closed, except during three hours of the ebb tide. These locks are constructed like ordinary canal locks, and vessels can be passed through them at any time, subject to the ordinary delays. A sheltered basin is formed by two moles extending into the river, between which vessels may await their turn for the locks; this basin is 328 feet wide by 1,312 feet long. Then come the parallel double locks, each 82 by 492 feet between sills and 30 feet deep. These will pass all save the very largest war ships at any stage of the tide, and of course ships of any size whatever can pass during the hours of slack water, when the gates are left open altogether. It is estimated that 4 steamers or 9 sailing vessels of ordinary dimensions can be locked through at once. Inside the locks is an inner harbor 656 by 1,640 feet for vessels bound westward that have come through the canal and await their turn to get to sea. The general width of the canal proper is 197 feet at the water surface and 72 feet at the bottom, with a depth of 29 feet 6 inches. Ordinarily, merchant vessels going in opposite directions can pass one another anywhere; but with an eye to future increase of tonnage and to existing men-of-war, there are at convenient points along the route 6 basins 328 feet wide.

The locks at Holteneau are similarly provided with outer and inner harbors or basins. Four railroad bridges cross the canal, two of which—at Brunthal and Levensau—are fixed bridges, and two at Rendsburg and Brunsbüttel are swinging draws. The fixed bridges are 137 feet above the water, so that by sending down their royal masts, the loftiest-spurred vessels can pass. The drawbridges are arranged in pairs, duplicated—that is, at some distance apart—so that if one of them is closed to railroad traffic by the passage of vessels the other one can, in most cases, be available. Provision is also made for foot and carriage traffic. The length of the swinging sections of these bridges is 328 feet longer, it is claimed, than any other similar structure in Europe. In this country, where such bridges have been longer in use, there are several of greater length. All the machinery of locks and bridges is operated by hydraulic power.

In the main, the line of the old Eider Canal has been followed for the easterly section, but

curves have been straightened and certain natural obstructions have been overcome that were too much for the resources of the earlier engineers. One interesting feature was the treatment of Flenhuder lake, which lay close to the line of the new canal, but at 21 feet higher level. The very considerable pressure of water at that height made it an unsafe neighbor. Accordingly, the lake was drained into the canal until the levels were identical. This exposed a large tract of lake bottom, and residents along the former shores of the lake protested against losing their water supply. Accordingly, a "ring canal" was built, retaining the border of the lake at its old level, while the main body of water was deflected into the ship canal, the current of the river serving to increase that of the canal so that the terminal locks at Brunsbüttel are kept reasonably clear of silt. The lake, too, is still deep enough to serve as a harbor.

Elsewhere extensive marshes of very difficult nature had to be overcome. Some of these consisted of semiliquid mud, perhaps with a tight coating of turf on top; others were bogs, and still others quicksands. Altogether, a section of the canal several miles in extent had to be constructed practically upon an artificial foundation. The method pursued was to construct temporary crib work strong enough to bear moderate car loads of sand, and in this way parallel dikes of sand on each side of the axis of the canal were pushed out into the marshes until a sufficiently stable foundation was obtained between the dikes for masonry and concrete. In a distance of 54 miles 64,000,000 cubic feet of sand were thus deposited, and the result seems to have been satisfactory. In round numbers, the total cost of the canal and its belongings was: Brunsbüttel locks, \$4,000,000; Holteneau locks, \$3,500,000; other construction, bridges, etc., \$31,500,000; total, \$39,000,000.

The interest of Germany in this great engineering enterprise is both commercial and military, though, in the larger sense, the military depends ultimately upon the commercial. It is estimated by Herr Augustus Sartori, President of the Kiel Chamber of Commerce, that the annual registration of vessels voyaging between the Baltic and the North Sea is about 18,500,000 tons, and he believes that 11,700,000 tons of this will pass through the canal rather than make the dangerous and intricate passage around the Danish peninsula. Elaborate tables have been made, showing the saving in time and distance between the various North Sea ports, but perhaps the most graphic way of setting forth the advantages is by considering the dimensions of Denmark. Given 61 miles, the length of the canal, and 600 miles of coast that must be circumnavigated in making the outside passage, we have the proportion: As 61 is to 600, so is the trip by canal to that by sea. But the

fourth term of the proposition is indefinitely increased by the unknown dangers of a North Sea voyage.

The Sault Ste. Marie Canal.—On June 12 this important Canadian work connecting Lake Superior and Lake Huron was opened for commerce. The completion of this work gives Canada unbroken navigation from the head of Lake Superior and from all its vast extent of northern coastline 2,384 miles to the Atlantic Ocean, a privilege that she has not enjoyed since the War of 1812. As soon as the northern wilderness began to be explored by Canadian adventurers it became evident that some means must be established of facilitating transportation between Lake Superior and the lower lake system. In 1798 a beginning was made, and a canal was finished ten years later across St. Mary's island, connecting the two lakes, and ample for all purposes of navigation at that early day. This was originally undertaken by one of the Northwestern fur companies, but the property was eventually transferred to the Hudson Bay Company. The canal was 300 feet long and 45 feet wide, and with a lock 38 feet long and 9 feet wide, which seems ridiculously small in comparison with the requirements for lake navigation at the present day. Early in the War of 1812 a company of 150 American volunteers, led by Major Holmes, crossed the strait and destroyed the canal so effectually that it never was rebuilt. The construction of a canal on the American side was begun shortly afterward, and pushed rapidly to completion. (For a history of this canal and its improvements, see "Annual Cyclopaedia" for 1889, page 744.) As this was made available by international treaty for the uses of

commerce, no steps were immediately taken by the Canadian Government to provide a canal on its own territory. During the Riel rebellion of 1870 it became necessary to transport men and munitions of war to the head of Lake Superior. Sir Garnet Wolseley (now Lord Wolseley, commander in chief of the British army) sought permission to use the American canal, but this privilege was refused by the United States, in accordance with the laws of nations. The trouble was overcome by landing troops and supplies on the Canadian side of the strait, sending the empty boats round through the American canal, which was available by treaty, and re-loading on the Lake Superior side of the carry. This was the first incident that forced upon the Canadians the importance of a canal of their own. The second occurred in 1892, when the rates on American cargoes passing through the Welland Canal were raised. The Government of the United States immediately notified that of Canada that tolls on Canadian vessels passing through the Sault Ste. Marie canal would be forthwith raised in retaliation. Upon this the Canadians withdrew their excessive tolls, but the need of a canal was still evident, more perhaps from a military than from a commercial point of view, since only about $3\frac{1}{2}$ per cent. of the total commerce passing the American canal is of Canadian ownership. The new Canadian Canal is 1,106 feet long in its masonry section, and 3,500 feet altogether, with a total length, including approaches dredged in the natural channel, of about 18,000 feet. The lock is 900 feet long and 60 feet wide, 22 feet below the lowest recorded stage of the water. There are 5 sets of lock gates. Two 45-inch turbines, of 150 horse power each, operate the generators for the electric plant. Water power is taken from Lake Superior and carried through a large pipe to the power house, where it divides, one branch going to each of the turbines. One turbine is capable of doing all the work, the other being kept for emergencies. The turbines can also be used to operate 2 centrifugal pumps to empty the lock chamber in case of need. This work can be effected at the rate of about 32,000 gallons a minute, emptying the chamber in six or seven hours. Two dynamos for electric lighting, and motors of 22 horse power for gates and valves, are provided for the ordinary working requirements of the locks. The work of construction was under the general supervision of Collingwood Schrieber, chief engineer of the Department of Railways and Canals. William Crawford was resident engineer. The gate machinery, with the exception of the electric plant, was designed by J. B. Spence. The total cost of the entire work was about \$4,000,000.

Harlem Ship Canal.—Considering the magnitude of the interests involved, it is singular that until the present year no ship channel has been made connecting the East river and the Hudson along the line of Spuyten Duyvel creek, which bounds Manhattan island on the north. This tidal stream was by nature only deep enough for the passage of small boats, and as it was very tortuous in the westerly part of its course, it was evident that costly engineering would be necessary to make it available for large craft. Congress ten years ago authorized

the construction of the canal, which was opened on June 17. The cost was to be \$2,700,000; it was to be 400 feet wide, with 16 feet of water at low tide and 21 feet at high tide. The appropriation has not been exhausted, but the work is not yet complete according to the original plans. The canal follows a curved course of about 1 mile from the Hudson to the Harlem, which is naturally navigable, or can easily be made so by dredging, to the East river proper. The principal engineering difficulty was Marble Hill at King's Bridge, where a straight cut 1,000 feet long was made to avoid the natural curves of the creek. The approaches to this rock cutting were through meadows on either side offering no special difficulties. As finished the canal has 15 feet depth at high water and 9 feet at low water, except in the Marble Hill cut, where the full depth is provided. The remainder of the line can be readily dredged to the required depth. One difficulty to be encountered in the use of this canal is the number of bridges that cross it, carrying the various railroads entering the city from the north and east. Some of these are high enough to admit the passage of vessels having masts or smokestacks of considerable height, and most of them permit the free passage of barges. The opening of the canal was the occasion of a celebration, more than 100 vessels taking part in the procession that passed through the new channel. United States war vessels were stationed in the Hudson and in the East river, off the outlets of the canal, and fired national salutes. On land a parade, military and civic, with strong detachments from the regular army and the National Guard, and many officials representing the nation and the State, lent interest to the event.

Amphibious Navigation.—Marine railroads on which large boats can be drawn from one water level to another are not uncommon, but the "Svanen" of Copenhagen is the pioneer of her class, capable of self-propulsion on land and sea. The inventor is a Swede, Lector C. J. Magrell, and the vessel was built in Sweden. She is 46 feet long, 9 feet 6 inches beam, with a maximum draught of 3 feet 6 inches. She is capable of carrying 70 passengers, and plies upon 2 lakes near Copenhagen, the Fure S5 and the Farun S5. These lakes, which afford a favorite excursion, are separated by an isthmus about 1,100 feet wide. Across this a track has been laid with ordinary railroad iron, descending into the water at either side by an easy gradient of 1 in 50. Funnel-shaped approaches are provided similar to those in American ferry slips, but narrowing almost to the width of the boat over the submerged rails. The "Svanen's" machinery is a screw-propeller engine, the shaft of which is connected by beveled wheels with an axle running athwart ship near the bow and carrying 2 wheels protruding through the bottom of the boat and adjusted so as to take the track of the roadbed. These are more like rollers than wheels, being only about 18 inches in diameter, and not intended to attain or endure a high rate of speed. Another similar pair of wheels is provided near the stern, but these last are merely carriers, not being fitted with driving gear. The boat, on approaching the land, heads straight for the slip, guided by the piles that form the ap-

proach, until the forward wheels strike the rails and her momentum starts her up the incline. At this moment the engineer throws the terrestrial machinery into gear, and with scarcely a perceptible pause the boat begins to mount the gradient by wheel power. The screw continues to revolve in the air all the way across the lathmus, as the inventor did not deem it worth while to provide a disconnecting device. The land speed on the up grade is about 250 feet a minute, and the same speed is maintained on the down grade by applying brakes so that the limit of safety shall not be exceeded. On reaching the water on the other side, the boat launches herself gently, the screw catches the water, the land-propelling machinery is disconnected, and the aquatic voyage is resumed. The frame of the boat is unusually strong, to sustain the jarring unavoidable in transportation, but she has stood the test of her first season, carrying altogether 20,000 passengers.

Bridges.—While the construction of concrete bridges is by no means new, it has experienced a considerable revival within a short time. The careful and economical Germans apparently take the lead in this movement, having lately constructed 2 monolithic bridges over the upper Danube, near Reichenstein. The first of these has a single span of 164 feet, and a total width, including 2 foot walks and a carriage way, of about 36 feet. A few interesting features of the construction may be noted. False work was erected for the entire sweep of the arch, and on this the concrete blocks were placed and allowed to harden. Solid rock was available for one of the abutments; the other could only be carried down to a solid natural foundation by deep and somewhat difficult excavation through wet gravel. To overcome this, piles were driven at an inclination of 15 degrees toward the bridge center, the tops of the piles being at least 18 inches under low-water mark. Around and over the piles a cement concrete was spread and carefully tamped, and additional precautions were taken to distribute the strain equally upon the heads of the piles. The arch is very flat, the rise at center being one tenth of the span, and its thrust correspondingly heavy, but this artificial foundation stood so firmly after the false work was removed that the actual settlement was a trifle less than had been calculated. The thickness of the concrete arch at the center was 528 feet, and 3-61 feet at the spring of the arch. The spandrels, in order to save weight and material, were made hollow in 2 series of arched chambers, 36 inches wide, concrete walls 24 inches thick separating them, the sides of the spandrels being 40 inches thick, of concrete, with exterior facing of stone. German Portland cement was used, in the proportion of 1 part cement to 7½ of sand and broken limestone. The total cost of bridge and approaches was \$22,500, the pay for common labor being 65 cents a day. The cost per square yard of road and footway was \$10. The bridge was designed by Government-Director Leibbrand, of Stuttgart, and constructed by Technical-Councillors Enting and Braun. The other bridge referred to has 2 spans, of 75½ feet each, with a central pier 8 feet 2 inches thick. In this bridge, the construction of which does not differ materially

from the other, provision was made for expansion and contraction by introducing pads of rolled leather between open joints at the crown and spring of the arch.

A concrete-arch bridge of 60 feet span and 32 feet wide was shown at the Antwerp Exposition, in 1894, by the North Portland Cement Works Company. The arch was 1 foot 7¼ inches thick at the crown, 6 feet 6¾ inches at the spring. The percentage of cement to sand and broken stone was very low—1 to 15 for the abutments and 1 to 8½ for the arch—but the structure was intended merely for exhibition.

Strength of a Truss Bridge.—The deliberate breaking down of a bridge in order to test its limits of endurance and observe the peculiarities of the final crash was probably never thought of until conditions suggested it in the case of a truss bridge over the Emme river, on the Jura-Simplon Railway, of Switzerland. The failure of a similar structure a few months before, and the increasing traffic of the railroad, led the management to determine upon replacing the bridge in question, and it was decided to see how much strain the old one would bear after more than twenty years of service. The trusses were to all appearance rather light in structure, 157 feet long and 19 feet high—1 foot less in height than were the trusses of the bridge that gave way—and therefore somewhat less able, probably, to endure a heavy strain. On April 9 the work of loading the bridge was begun, gravel and rails being piled upon one half of the roadway, from the middle of the span to one end of the bridge. The work continued until April 24, when the strain was reported at 7,800 pounds to the linear foot of half the bridge. Slight deflections now became apparent, but the loading was continued. At nine o'clock on the morning of April 25 the load had increased to 9,400 pounds to the linear foot, and, although small cracks, increasing in number, became visible at various points, it was not apparent to the expert who watched the progress of events where the break would finally occur. At forty minutes past nine the collapse came, so suddenly that nobody could note where the initial break occurred. By a most unfortunate oversight, no provision had been made for photographing the fall of the bridge, as might easily have been done; and the only satisfactory conclusion seems to be that the structure, in spite of its supposed untrustworthiness, held an ample margin for safety—nearly three times what is required by the bridge-building rules of some of the best railroads in this country. The usual test of such a structure is to send across it 2 or 3 heavy locomotives, and if it endures a strain of 3,000 pounds to the linear foot of roadway, its security is deemed well within the requirements of safety.

The Jeddo Tunnel.—In 1888 a system of coal mines near Hazleton, Pa., was flooded by the invasion of surface water, which entered so rapidly as to defy all efforts for its exclusion. The works were totally submerged and abandoned, but the topography of the neighboring country was such that it was possible to drive a tunnel from Butler valley, 5 miles distant beyond a mountain range, which should tap the flooded mines. Work began in 1891. Two

shafts were sunk in the intervening mountain ridge, and headings pushed both ways from each of them, as well as from the Butler valley end. The main tunnel is 7 by 9 feet, and progress was slow, owing to the hardness of the rock encountered and to a considerable local inflow of water, which had to be pumped out as the work went on. The connection between the tunnel and the flooded mine was made by drilling a smaller hole for 440 feet, through which, it was estimated, 500,000,000 gallons of imprisoned water would discharge in about two months, the estimated rate being 8,000 gallons a minute. Not a single life was lost during the progress of this necessarily hazardous work, and only 4 men were injured. The Ingersoll-Sargent rock drills were used, and forcite was employed for blasting, as this gives comparatively little smoke and is less violent.

Improved Carriage-Roads.—Few persons realize what enormous engineering interests are involved in the improvement of ordinary carriage roads. A report lately issued by the United States Bureau of Agriculture embodies information collected by the Department of Road Improvement. Returns were received from about 1,200 counties, showing that the average length of haul from the farm to market or railroad is 12 miles; the average weight of load for 2 horses, 2,002 pounds; average cost per ton per mile, 25 cents, or \$3 for the round trip. The total volume of farm products in the United States is estimated at 219,824,227 tons, and at this rate, the aggregate expenditure for road hauling amounts to \$659,472,681 per annum. If the average load could be doubled by improving the roadbed the cost of transportation would be halved. If 10 per cent. of this enormous sum—or, in round numbers, \$50,000,000—could be devoted annually to the improvement of roads few would be disposed to question the wisdom of the expenditure. The cost of transportation determines the producer's profit, and the prices of farm produce, on which more than on anything else the general prosperity of the country rests, is fixed at the commercial centers. The great problem, then, is to bring down the cost of transportation. While freight by rail costs from 4 mills to 1 cent a ton for each mile, that by ordinary country roads costs often fifty times as much; therefore, inferior roadways make an enormous and generally unsuspected drain upon the resources of the nation. The same power that hauls 1 ton on an ordinary country road can haul 4 or 5 tons on hard roads, such as are being constructed in many States. The introduction of bicycles has been a powerful incentive for the improvement of roads. Manufacturers of these vehicles for sound business reasons advocated roadways favorable for the use of wheels, and the users of the wheels themselves naturally advocated anything that would render their favorite recreation more enjoyable. As they are for the most part young men active in public affairs, their influence soon made itself felt in voting appropriations for roads in town meetings and elsewhere; and now that wheeling has grown to be vastly more than a mere recreation its influence will be correspondingly increased in this most important department of engineering.

High Buildings.—Modern construction of very lofty buildings necessitates extreme care in the preparation of foundations, and where it is necessary to excavate to a great depth in order to reach bed rock or so-called "hardpan" the question of expense becomes very serious. A new system of construction has been introduced recently in New York by the Hydraulic Construction Company, with the approval of such engineers as H. W. Brinckerhoff, G. W. McNulty, and John Bogart, all members of the Society of Civil Engineers. It consists of an adaptation on a large scale of the well-known device of sinking piles or hollow iron columns by hydraulic action. In the case of foundations, large iron cylinders, or caissons, 8 or 10 feet in diameter, are made of boiler iron or some similar material. They are in sections of a length to be conveniently handled and transported on trucks. A shallow excavation is made in the surface earth where the foundation is to be laid, and the cylinder is stood on end at the place where wanted. A set of water pipes passes down within the caisson and connects with a perforated foot that extends around the entire lower edge. Through these pipes and out at the perforations water is forced at a pressure sufficient to wash away the earth under the edge of the caisson, which is ordinarily loaded on top with pig iron or kentledge resting on timbers, and, if necessary, an additional weight is provided at the sides. As the top of each section reaches the level of the earth the current is checked until the weight can be removed and another section bolted on. Then the weights are readjusted, the current is turned on again, and the caisson eats its way downward. The only delay in sinking these caissons to almost any desired depth arises from the necessity of providing against a dangerous pressure from without. So long as the caisson is filled with water or with earth pressures are equalized, but when these are removed there is danger of collapse. To obviate this, timber frames are inserted when the material is removed from within. These are placed crosswise and tightened by means of wedges, an open space being left in the center of the caisson between the timbers, so that soil can be hoisted up by means of a small derrick. Some care is requisite in managing the valves that control the flow of water through different sections of the cutting edge, in order to maintain the caisson in a vertical position. In one instance a careless foreman permitted the caisson to sway about 16 inches out of plumb by the time it reached the rock. It was, however, successfully straightened, in about ten hours' work, by the help of two jacks and the use of water jets discharged through those sections of the cutting edge opposite the jacks. When the caisson is finally settled to its position on the rock, the contents are removed and measures are taken to make the lower edge fit the inequalities of the rock. Cement is poured in at the bottom, and sometimes on the outside. In case of quicksand or of any material that finds its way under the edges of the caisson, extraordinary measures may at times be necessary; but no difficulties have as yet been encountered that have not been readily surmounted by the exercise of ordinary ingenu-

ity. Sometimes the edge of the caisson has encountered boulders, but these have ordinarily yielded to the action of the water flowing around them and forming a pocket in the soil, either within or without the caisson, until progress can be resumed. Often the downward motion of the caisson is so rapid that it can be followed readily by the eye, and from six to thirty-six hours apiece is the record for sinking each of twelve caissons, some of which were 30 feet long.

Water to the amount of about 50,000 gallons a day is drawn from the mains and delivered direct to the pressure pumps, and after doing its work is allowed to flow into a settling tank, whence it is drawn and used over again. It has been found practicable to use one of the caissons as a settling tank after it has been placed in position and the bottom sealed with cement. The caissons are placed by the engineer in charge along the lines where the structural load will rest. When all the material has been removed from the interior of the caisson the whole space is filled up with a concrete formed of cement, sand, and broken rock, or, if preferred, the whole interior can be built up with masonry of stone or brick. Solid columns of artificial stone are thus provided, reaching down as far as may be necessary, re-enforced by the adjacent earth, and growing harder with process of time. The iron or steel caisson may disappear through corrosion in the course of a few years; but this is not of the slightest consequence, as the surrounding earth must at once take its place without danger to the superstructure.

Wind Bracing.—With the construction of buildings having 15 to 25 stories and towering 300 feet above the street pavement the problem of resistance to wind pressure forces itself upon the attention of architects and engineers. A paper entitled "Wind Bracing in High Buildings," read before the American Society of Civil Engineers by Guy B. Waite, attracted deserved attention, and called forth protracted discussion at a meeting of the association, which brought out many facts and opinions drawn from the experience of different members, some of whom are very distinguished. One difficulty encountered in such structures is that the forces to be resisted are not as yet very well understood. The resistance of modern walls and partitions crosswise and lengthwise, particularly at great heights, has not been determined with trustworthy accuracy. The tables of resistance for open-work structures, like bridges, trestles, and Eiffel towers, are better understood. The fact that such structures have endured uninjured the storms of many years proves that the calculations of the constructing engineers have not been very far out of the way. It is a fact, however, that many buildings, large and small, are erected without any special provision against wind forces, which, in view of the large areas exposed above surrounding structures, must be formidable. The conclusion would seem to be justified either that the modern method of construction is peculiarly adapted to resist, or that the force of the wind has been largely overrated. The force of storms varies according to laws not yet wholly understood. For instance,

the storm of Oct. 10, 1894, in New York, according to George A. Just, C. E., reached a maximum velocity of 60 miles an hour for a short time, but was far more destructive than the storm of March 28, 1893, which registered 75 miles an hour and averaged 55 miles for a period of nearly twelve hours. The first-mentioned storm was from the northeast, and was accompanied by heavy rain; the other was from the northwest, without rain. Moreover, the point of observation for the second storm was 126 feet higher than that for the first. Allowing for all these differences, the March storm ought apparently to have been far more destructive than its predecessor. The records of the two storms as taken at the Central Park and at the United States Signal-Service Station vary considerably in all details except rainfall. This is explained in part by the difference in altitude. Mr. Just very properly urges the preparation of more exact data of the total resultant effect of wind rather than the maximum pressure, as it has heretofore been termed. The fact appears to be that a wind accompanied by dampness or by rain has far more destructive power than one that is comparatively dry.

The best modern practice in the construction of lofty buildings appears to be to anchor the outer walls and the interior steel cage securely together, utilizing floors and partitions, and cross bracing between columns so that strains will be distributed from one wall to another, and the whole structure be united in absolute rigidity. This method should form a far more enduring structure than was possible under old forms of construction. With a steel interior framework properly put together, the strength of the walls and their power of resistance to all forces from without is enormously increased.

One of the chief dangers in steel construction is corrosion. An instance is given in the case of a building in New York, less than a generation old and very recently demolished to make way for a modern structure, where the ends of the beams had so rusted away that the flanges could be broken off with the fingers. Of course such a destructive process as this must necessarily render a building less capable of resistance to wind pressure in the course of a few years than it was when first completed. The difficulty of adequately protecting steel beams, even when they are properly imbedded and anchored in masonry, was instanced in one of the great modern buildings in New York, where an excellently laid brick wall nearly 4 feet thick was found to be so readily permeable by water under violent wind pressure from northeast storms that a considerable flow of moisture trickled down on the inside. This was corrected by painting the outside of the wall. Another danger is that when the parts of a steel structure do not join accurately, as, for instance, when a column is not vertical on being set in position, it is too common a practice for the workmen to correct the slight fault by driving a few nails under the edge of the column until it is perpendicular, or, which is a little better, but still not commendable, by using thin bits of iron, called "shims" or "Dutchmen," instead of nails. Of course, such makeshift devices set at naught all calculations for the permanent distribution of

strains, since the columns carrying perhaps the entire weight of the building, instead of bearing on solid flat surfaces bear at best upon several distributed points. When the building settles, or corrosion sets in, these points are the first to feel its effect and yield to the tremendous pressure. In the case of the recent collapse of a building in New York it was shown by investigation that the disaster was probably chargeable to precisely this kind of work. Floor beams of different depths were made to fit by makeshift devices, and, so far as was ascertainable, the bearing of the principal column upon its base was so ill adjusted that a collapse was inevitable sooner or later. Fortunately, it took place before the building was finished.

Conscientious supervision on the part of architects, engineers, and city officials seems to be the only guarantee that steel-frame construction will not become more and more insecure the older it grows. If not properly protected, such a structure must necessarily weaken by corrosion, and eventually become incapable of resisting excessive wind pressure.

Strength of Brickwork.—A fund for experimental research has been established by the Royal Institute of British Architects, and their first investigations are directed to brickwork, as being upon the whole the most generally useful form of masonry. The phenomenal endurance of bricks for all crushing strains has been recognized time out of mind, even the scriptural Tower of Babel having been built of brick. Its strength under what may be termed beam strains is known to comparatively few. A brick wall about fifty years old was available for the experiment, which was conducted by Mr. A. G. Lyster, and is described in the journal of the Institute. The wall was two feet thick, and an opening twelve feet square was cut through it. Near the ground a lintel or bridge of bricks was left, reaching across the opening. At first this bridge was seven courses thick, but it would not break under all the iron that could conveniently be placed upon it, so the load was removed and three courses of brick were knocked off and the ends cut clear of the surrounding brickwork. This left four courses of bricks. Then the iron weights were replaced to the amount of 6 tons 9 hundredweight and 23 pounds upon the center of this seemingly slender support. The brick beam carried this load for thirty hours without any apparent sign of giving way. When finally it did break, the fall took place at night when it could not be observed. All the materials in this wall were of the best kind—the lime and mortar was strongly hydraulic and the bricks handmade. It is not likely that average brickwork would stand anything like such a test, but the experiment tends to increase confidence in brick or terra-cotta work of all kinds, provided reasonable care is taken in the construction and in the preparation of mortar. Especially is this true of the floors of modern buildings, which are to a very great extent practically of brickwork resting on iron floor beams. The pieces of which these floors are composed are or should be so shaped that they bind firmly together and sustain their load by thrust as well as by the adhering surfaces that are covered with mortar or cement.

A Novel Coal Dump.—The Excelsior Iron Works of Cleveland have lately constructed, from the plans of Timothy Long, a new device for unloading coal cars, which promises to be superior to anything of the kind thus far introduced. A strong cylindrical frame is constructed of steel truss work, of sufficient dimensions to allow an ordinary coal car to run through it on tracks that extend from end to end and "register" with the rails of the permanent way. The loaded cars, as they come up, are successively run into it, the wheels are blocked, and powerful clamps, actuated by hydraulic power, grip the car along its platform and framework. This is effected by a very simple adjustment, which acts almost automatically on all cars ordinarily used for coal transport. When the clamps are fixed, a set of machinery is thrown into gear and the entire cylinder revolves, rolling up an inclined cross track until the car is upside down and every particle of coal tumbles out into a chute below. The cylinder is then allowed to roll back to its original position, the clamps are loosed, and the empty car goes on its way, to be followed by a succession of loaded ones. In a test case—doubtless prearranged for purpose of record—it is said that 3 fully loaded cars were discharged into a vessel lying alongside the wharf in three minutes. The whole apparatus is operated by an engine of moderate size, and the services of only 3 men are required.

Laying a Gas Main.—In the course of the construction of the Harlem Ship Canal it became necessary to lay a 12-inch gas main across and under the navigable channel at Kingsbridge. As the work must necessarily be submarine, it was desirable to finish it quickly so as to interfere with navigation for the shortest possible time, and to lay the section of pipe in one piece, so that water should not find its way inside. The problem involved the laying of a section 378 feet long, weighing about 50,000 pounds, in water 20 feet deep. By means of a suction dredge a ditch of the required dimensions was cut across the bottom of the canal, inequalities being cleared away from its bottom and everything prepared for the reception of the pipe. Twelve pontoons were constructed of heavy hemlock timber and painted with coal tar; they were each 50 feet long and 5 feet square. They were arranged in pairs with crosspieces holding them 3 feet apart. Between these pairs of pontoons the sections of pipe were suspended, so that they hung just clear of the water. A central section of 78 feet was put together, the joints being of the Ward flexible pattern, and floated on its pontoons to the middle of the channel, leaving spaces open for navigation between either end and the shore. Along the shores 2 other sections, each 150 feet long, were floated and joined on similar pairs of pontoons. On Oct. 13, at slack low water, navigation was stopped, and the 2 shore sections were swung out till the ends touched the middle section already in position. Workmen were ready, the pontoons were securely anchored, the connections were made between the sections of pipe, and ropes were adjusted to derricks, which stood on the pontoons ready for lowering. A large number of men had been drilled to work these

ropes, which were marked off with red paint in 1-foot lengths. At a signal each man slacked away on his rope, lowering it slowly 1 foot. Then, without waiting for orders, he made it fast. In the meantime other men, at the 2 shore ends of the pipe, were adjusting the vertical section, the connecting elbow of which should sink under water with the main pipe. This done, the lowering proceeded, 1 foot at a time, and in about four hours the entire length of pipe was safely deposited in its bed at the bottom of the canal. The pontoons were swung out of the channel, and the blocked fleet of barges and canal boats resumed its course. On attempting to adjust the vertical stand-pipes, however, it was found that something had gone wrong, and a diver discovered that as the pipe settled into position it had buckled slightly upward, so that several lengths did not rest upon the bottom. In order to correct this, the engineers resorted to an ingenious and somewhat daring expedient. The hoisting ropes were readjusted, but not "plumb." Each rope where it encircled the pipe was moved a short distance out of the perpendicular, so that when raised clear of the bottom the whole length of pipe would tend to swing a few inches, and so straighten itself. The lifting power of the rising tide was trusted to do the work, the men standing by to slack away when the word was given. Slowly the floating pontoons rose with the water, and as soon as the point was reached where the tendency to swing overcame the holding power of the bottom the whole length of pipe swung itself gently into position, the signal was given, the ropes were cast off, the long pipe settled easily into its bed, and the adjustment was found to be perfect. No leaks developed, and this ingenious piece of engineering appears to have been entirely successful. The credit of the affair is due to Messrs. W. H. Bradley and C. C. Simpson, consulting engineers of the Consolidated Gas Company.

Compressed Air.—Electricity is not enjoying a monopoly in the distribution of power and the operation of new mechanical appliances. In France street cars are successfully operated by compressed air. On the Chicago Drainage Canal powerful compressors force air at working pressure through pipes 2 or 3 miles long, distributing power to rock drills along the route; flexible connections are also made with small engines used for various purposes on the works. Pneumatic hoists and other appliances have been made very simple and convenient, and are coming largely into use. As a refrigerating medium for freezing wet soils, where it is difficult to prepare foundations, compressed air has been successfully used.

One of the most remarkable discoveries in this direction, and one apparently destined to revolutionize much of the most familiar machinery in domestic establishments as well as in manufacturing, is known as the "air lift." It was originally devised by Dr. J. G. Pohlé in 1884. He was superintending mining operations in Colorado. In the works under his management was a tunnel about 1,200 feet long, and at the end of it a shaft 65 feet deep. This shaft became filled with water, which had to be pumped out. An air compressor was available outside

the tunnel, driven by water power, and he decided to pump the water out of the shaft by one of the ordinary methods of using compressed air. An apparatus was constructed, as shown in Fig. 1, except that the connecting pipe at F

between the air pipe and the discharge pipe was not at first introduced. An iron box, A, with an upward opening valve, B, in its bottom a discharge pipe, C, and D, an air pipe by which the compressed air was forced downward into the box. The box was lowered nearly to the bottom of the shaft, and the compressed air forced in at the top until nearly all the water contained in the box was driven out through the discharge pipe, whence it fell into a drain, and ran out of the tunnel. The principle is exactly the same as that of the familiar water siphon, or like the less popularly familiar contrivance used by chemists in laboratories, known as the Berzelius washer. This simple apparatus worked well enough until a leak developed in the iron box, releasing part of the compressed air, which made a considerable disturbance in the surrounding water. This proved to be one of those lucky accidents that lead to important discovery. Instead of stopping altogether, the flow of water continued from the discharge pipe in diminished volume at a height of 65 feet above the leaky box, and Dr. Pohlé's curiosity was naturally aroused. After studying the problem for some hours, he conceived the idea of connecting the two pipes, as shown at F, the new pipe being provided with an air cock. When all was ready the compressor was started and the cross connection opened, admitting air into the discharge pipe near the surface of the water. The immediate result was a largely increased and quite violent discharge of water at the top of the pipe. It was further found that the expenditure of power by the compressor pump could be largely reduced, while the discharge of water still increased in volume, though the air pressure was only half what was required before the leak developed in the box.

This discovery called for reconstruction and resulted in what is now known as the "Air lift." A discharge pipe with a bell mouth at its end is lowered into the well and firmly fixed there, with its mouth as far below the surface of the water

as is convenient or practicable. Beside this is a smaller compressed-air pipe going down to an equal distance and bent so that it opens upward and delivers compressed air under the mouth of the discharge pipe. When the lift is not working the water level is identical in the well and in the discharge pipe. When the compressed air is turned on a bubble immediately fills the base of the discharge pipe and lifts the water above it as far as it can by the combined force of expansion and buoyancy. Another bubble forms instantly as the water rushes in below bubble number one, and adds its lifting effort, assisted instantly by bubble number three; and so they follow one another, each pushing its quota of water up the pipe and expanding so rapidly that the discharge at the surface is apparently continuous. This operation of what may almost be termed a natural law was mysterious so long as metallic pipes were used, but working models were constructed with glass pipes, and the explanation of the phenomenon became evident at once. The height to which water can be lifted depends upon the depth to which the bell mouth of the discharge pipe can be submerged. With such an apparatus as has been described Dr. Pohlé has lifted water several hundred feet, but he regards 150 feet as the limit beyond which it is desirable to use a series of lifts one above the other, connected with a common pipe for furnishing compressed air.

The great practical value of this discovery has been generally recognized only within a year or two. Practically it overcomes the limitations of the old-fashioned pump as defined by atmospheric pressure, and does away altogether with the direct lifting appliances necessary in the case of the force pump. At Asbury Park, N. J., a trial was made in a 4-inch well 570 feet deep, which did not discharge naturally at the surface. With the air lift it discharged 178 gallons a minute. When applied to a 6-inch well near by which had a natural flow at the surface the discharge was increased nearly fourfold, and the surface discharge ceased. Thus it is seen that wherever a small power is available—either water power or any of the small motors used for domestic purposes, or even hand power—compressed air can be made largely to increase the water supply, and, in fact, provide running water in localities where it has previously been unknown except by the introduction of costly waterworks. Probably the most available power for this purpose will be found in windmills, which can be used to compress air into reservoirs conveniently located, whence its own elasticity will carry it wherever needed.

While we are on the subject of compressed air, a device may be mentioned which is expected to bring the top stories of lofty city buildings within reach of fire extinguishers. Heretofore it has been necessary to provide tanks at least 10 feet higher than the highest ceiling in the building. These tanks have to be filled with water, and kept full, and in case of fires they afford inadequate protection to the top floor because the head pressure is not sufficient to throw an effective stream. The new plan is known as the pressure-drum system, and has been placed in several large buildings. A series of drums is provided, each 5 feet in diam-

eter and 9 feet high, capable of resisting an interior pressure of 200 pounds to the square inch. A service pipe runs from the end drum to the top of the building, with hose and the necessary appliances on each floor. Into these drums compressed air is forced, and as it retains its elasticity indefinitely, the attendants in the building have nothing to do but turn on water at any floor, and a powerful stream is at once available. This, it is calculated, will continue for about twenty minutes, by which time the fire department should be on hand, when the engine hose can be attached to the drum and the supply of water kept up as long as it is needed. The device, it is understood, has been approved by the Board of Fire Underwriters in New York.

A New Sectional Side-launch Dock.—The launching of vessels, sea-going and otherwise sidewise instead of endwise is not uncommon on the Great Lakes, and several permanent sets of launching ways have been constructed. The first of this kind on the Mississippi river is a few miles below St. Louis. It is used mainly for the construction and repair of river boats, which are flat-bottomed, seldom drawing more than 4 feet of water, and of such width that ordinarily they do not need to be shored up. Steamers of 1,000 tons burden have been raised on this dock, some of them 360 feet long, 50 feet wide, and 9 feet in depth of hold. The general slope is formed of heavy timber ways, shod with iron 8 inches wide and forming tracks for the iron wheels that support the cradles. Other wheels, running on each side of the ways, keep the cradle wheels on the tracks. At the upper end of the sloping ways is a long iron or steel shaft running the full length of the dock, and above this a counter-shaft with sprocket wheels carrying a heavy iron chain, which connects with the cradles. The large chains known as the carriers have links 9 inches long made of 1½-inch iron. These follow the sides of the ways extending under water and passing around pulleys at the lower edge of the framework, where the water is deep enough to float any river craft. When a steamboat or other craft is to be docked the cradle is allowed to run down the ways until it is submerged to the required depth when the vessel is floated upon or over it, the shaft is revolved, and the cradle emerges easily from the water, carrying its load up the slope. Adjustments are made to guard against any possibility of unequal motion among the cradles when the shaft is revolving, and it is found that the largest of river steamers may be safely and expeditiously handled by this machinery.

Electricity for Elevated Roads.—Chicago has taken the lead in the application of electricity as a motive power on the elevated lines. A number of these lines were constructed during the Columbian Exposition, and did excellent service with ordinary steam rolling stock during that crowded period. Since then they have been run at a loss, and the electric appliances have been introduced partly with a view to diminish expenses, partly to attain higher speed, and partly to get rid of much of the dust and noise incident to steam service. The tracks in use for the electric motors are laid with 90-pound T-rail, each securely bonded to the supporting structure. A third or trolley rail is a 45-pound T-rail placed

on one side of the track. This trolley rail is supported on blocks of Georgia pine impregnated with paraffin, and these, in turn, rest on iron pedestals without further insulation than that afforded by the wood. The conducting quality of these rails is perfected by light fish-plates and copper strips. On the Metropolitan line the motor cars are 40 feet long, the controlling devices being in the corners of the car and occupying but half of the platform, each car carrying a 3-horse-power motor and a small air pump for working the brake. The cars seat 40 persons. The motor cars are used as smoking cars, the trailers or regular passenger cars having a larger seating capacity. The power equipment of the motors is 2 100-horse-power motors, registering 2,000 volts. These are mounted in the trucks, and the current is taken from the trolley rail by sliding iron shoes depending on each side near the corner of the car. The 2 sliding shoes are made to break joints, so to speak, so that where interruptions occur at crossings and switches one shoe or the other will be continuously in contact with the trolley rail. In general, a train consists of 4 cars.

The power plant is believed to contain the largest dynamo in the world. It is at present capable of producing about 6,000 horse power, and it is understood that this can readily be doubled.

Hydraulic Dredge.—Probably the largest hydraulic dredge in the world, certainly one of the largest, has been designed by Lindon W. Bates, civil engineer of Chicago. It is building for the United States Government and is intended for work on the bars in the channel and at the mouths of the Mississippi river. The general dimensions of the float are, length, 172 feet by 40 feet; beam, 7 feet 10 inches deep. Nominally the boilers are 3,000 horse power, with a pumping capacity of 6,000,000 gallons an hour. To make a cut through an ordinary river bar 40 feet wide it is assumed that 25,000 cubic yards of material must be removed. To accomplish this in twenty-four hours a machine must be able to dredge at least 1,600 cubic yards an hour. It is claimed that under favorable conditions this machine can nearly double that performance. Briefly, the construction of the dredge is as follows: In front of the float are 6 hollow cylinders, each 5 feet in diameter and 35 feet long. These rest side by side, and can be projected forward and downward. Machinery causes them to revolve at will, each about its own vertical axle, and as they are lowered they cut into the bottom of the river, and by revolving loosen the soil, churning it into a semi-liquid mud, which is then pumped up through 30-inch pipes attached for the purpose to the cylinders. The pumping is done by 2 independent centrifugal pumps, which deliver the material dredged into larger pipes and discharge it at whatever height may be necessary for it to descend by gravity to the dumping ground. The dredge can be moved in any direction by the operation of anchor spuds.

Harbor of Refuge.—An interesting instance of adapting natural features to the requirements of commerce is found in a work lately completed at Block island, off the coasts of Rhode Island and Connecticut. This little island,

about 9 miles long, lies in the track of coastwise and to some extent of trans-Atlantic commerce, 25 miles off shore, midway between Montauk Point and Martha's Vineyard. It is now something of a summer resort, but until a few years ago was inhabited only by fishermen. It has no natural harbor, and the boats used by the inhabitants had to be hauled up on the beach by means of tackle, usually operated by oxen. The island is nearly divided by Great Salt pond, which is separated from the ocean on both sides only by narrow strips of land. The pond, which has a maximum depth of 60 feet, covers about 1,600 acres, so that vessels of considerable size can find safe anchorage within its area. The work has thus far been done at the expense of the State of Rhode Island. Col. Mansfield, of the United States Engineer Corps, acting under orders from the department, has made a survey of the harbor, and reported in favor of deepening the channel to 25 feet, and widening it to 600 feet.

EVANGELICAL ASSOCIATION. The statistical report made to the General Conference of this denomination, held in November, represented that it had lost about 40,000 members by the division it had suffered, while the reduction in missionary contributions had not been more than \$5,000 a year. The publishing house in Cleveland, Ohio, had realized a gross profit of \$213,119 in four years, and its receipts during that period had been \$7,975 more than in the preceding quadrennium. Since it was instituted, in 1838, this concern had disbursed \$275,797 to annual conferences. Its various publications had an aggregate circulation of 232,105 copies. The branch publication house at Stuttgart, Wurtemberg, likewise made a satisfactory exhibit. The sum of \$26,000 was apportioned from the profits of the publishing house in dividends among the annual conferences. The missionary receipts for the past year had been \$135,538, and the total receipts for the past four years \$543,774, while the expenditures for the four years had been \$600,209. The missionary moneys were divided between the Home Mission and the European and Japan Mission funds, for which separate accounts are kept. All the missions were represented in the address of the bishops as being in a prosperous condition. The Home Missions included 497 stations, with 497 missionaries, 39,600 members, and 6,662 members newly received during the year, while 16 missions had been changed to regular stations and 40 new missions had been established. In the foreign fields were 84 stations, 119 missionaries, and 11,829 members, with 1,226 members received during the year, 7 missions changed to regular stations, and 1 new mission. Of the whole number of members returned, 11,112 were in the European missions in Germany and Switzerland. The Japan conference returned 17 pastoral charges, 19 missionaries (including 3 Americans), and 727 members, showing an increase of 77 members. A Deaconesses' Home was connected with the European mission. The contributions of the Woman's Missionary Society amounted to \$2,500. The Young People's Alliance was organized in 19 conference branches, with 768 local alliances and 28,743 members.

The twenty-first annual conference met at Elgin, Ill., Oct. 3. Among its more important

acts were the change of the "time limit," or the period during which a minister can be sent by annual appointment and reappointment to the same pastoral charge, from three to four years; the appointment of a commission to revise the language of the Discipline, whose work is to be submitted for approval and examination to another larger committee, and then reported to the next General Conference; the institution of an English and a German paper for the Young People's Alliance; and the adoption of a provision for lay representation in the General Conference on the basis of one lay delegate for each annual conference having 4,500 members, and two for those having 9,000 members, but no conference to have more than two; conferences having less than 4,500 members are to be formed into districts, which shall stand under the same regulation as those single conferences which are entitled to one and two delegates. Lay delegates were given equal rights with the ministerial delegates except in the trial of ministers, the reception of candidates into the ministry, the ordination of ministers, and the transactions of annual conferences concerning trials of ministers. Qualification for election to be lay delegates was limited to male members of at least thirty years of age and of seven years' standing as members of the Evangelical Association, and who "have proved themselves faithful." A commission was appointed to prepare nonresident and correspondence courses of study and reading for preachers, supplementary to the regular course for junior preachers, in English and German, and a course of reading in German and English in the various departments of knowledge adapted to the young people. Propositions to make presiding elders eligible for only two terms in succession, to insert a question concerning membership in secret oath-bound societies in the list of questions addressed to candidates for license to the ministry, to question such candidates concerning their use of tobacco, and to make the presidents of the colleges *ex-officio* members of the General Conference were not approved. To a request for a definition of the relation of baptized infants to the Christian Church, the General Conference responded that, whereas the membership of such children was divinely recognized and the Evangelical Association had received them from the time of its organization and had made provision for their registry and enumeration, no further action was necessary to explain its position. A rule was adopted that no preacher should be permitted to remain longer than two years in the itinerancy without appointment. Resolutions were passed favoring divorce on biblical grounds only, and recommending the harmonizing of the divorce laws of the different States on a sound moral basis; pledging opposition to all encroachments upon the sanctity of the Sabbath; expressing utter abhorrence of any method of dealing with the liquor traffic that provides for its continuance, and warning all members of the church using or trafficking in intoxicating liquors of the penalties prescribed against them in the Discipline of the Church; and discountenancing the use of tobacco and trafficking in it. The young people were urged to acquire a liberal and, if possible, a classical, education. J. J. Esher, Thomas Bowman, S. C.

Breyfogel, and William Horn, bishops for the past four years, were re-elected for another term of four years.

EVENTS OF 1895. The year 1895 opened with a great war in progress in the Eastern Hemisphere, and several lesser wars and insurrections elsewhere more directly involving European and Western interests. It closes with Japan the most formidable of the Oriental powers; with an allied European fleet anchored within easy reach of the Dardanelles; with the insurrectionary forces in Cuba threatening the approaches to Havana, the Spanish capital; with an armed but unauthorized British invasion of the Transvaal in South Africa; and a very grave diplomatic complication between Great Britain and the United States. The most deplorable conditions of the year have centered about Armenia in Asia Minor, where many thousands of Christians have been ruthlessly murdered by Moslems in spite of protests from the civilized powers and seemingly in deliberate defiance of half-hearted measures of repression on the part of the Sultan. On the whole, the year seems to mark a transition period rather than the realization of any great movement toward a higher civilization.

January 1. New York: Meeting of the Legislature at Albany; Hamilton Fish chosen Speaker of the Assembly. Kansas: Anderson Grey sentenced to be hanged for having committed a murder by hypnotizing another man. Dispatches from eastern Turkey confirm reported massacres of Armenian Christians.

2. United States Senators Wolcott, of Colorado, and McMillan, of Michigan, re-elected by the Republicans. England: A committee of the Privy Council reverses the decision of the Canadian Supreme Court in the Manitoba school case, giving the Dominion Government power to legislate in behalf of the Roman Catholics. Russia and England agree upon an amicable settlement of the Pamir dispute. Turkey: Mgr. Izmirlian confirmed Patriarch of Armenia. Brazil grants amnesty to participants in the late rebellion.

3. Washington: The President nominates Col. G. Norman Lieber to be judge-advocate general of the army. Georgia: County elections show heavy Democratic gains. Maine: United States Senator Fry unanimously renominated by the Republicans. San Francisco: A civic federation organized to begin a crusade against vice.

4. Austria: The Government protests against a discriminating duty imposed by the United States tariff as being against treaty rights. Turkey: The Porte applies to the powers under the Berlin Treaty for protection against Great Britain and Russia in regard to Armenia.

5. Washington: A meeting of Cabinet officers considers the German protests against alleged treaty violations on the part of the United States. John Burns, M. P., the English agitator, sails for home. France: Captain Dreyfus, of the army, is publicly degraded in Paris for having sold French military secrets to foreign governments. Italy: Dissolution of the Parliament.

Rear-Admiral Kirkland, flag officer of the Mediterranean squadron, reprimanded by the Secretary of War for a private congratulatory letter to President Faure of the French republic. Major George A. Ames, U. S. A., retired, addresses an insubordinate letter to Maj.-Gen. Schofield: he is arrested and placed in confinement.

28. Gen. Nelson A. Miles becomes commander in chief of the army of the United States in place of Gen. Schofield, retired. Atlanta: The attendance at the fair was 30,000, the largest yet recorded. New York: In the yacht race for half-rulers Ethelwynne wins, defeating the English yacht Spruce II.

29. St. Louis: Four hundred cases of diphtheria are reported by the health authorities.

30. International cricket match at Philadelphia, the "Gentlemen of Philadelphia" defeat the Oxford and Cambridge eleven. China: At the demand of England the Viceroy of Szechuen is degraded for acts offensive to England. Hungary: The Diet adopts bills recognizing the freedom of religious worship. Madagascar: Capture of the capital of the island by France after an arduous campaign costing many lives from sickness. Russia: Several thousand deaths reported by cholera during the month.

October 1. Kentucky: The convention of the Methodist Episcopal Church votes to admit women as delegates to the General Conference. France: A contract is signed to lay a telegraph cable from Brest to New York. Korea: The Queen murdered in her palace at Seoul.

2. Nebraska: The State Republican Convention opposes monometallism and demands an honest dollar. Minneapolis: The Protestant Episcopal Church of America begins its thirtieth annual convention. Washington: First Eucharist Congregation of the Catholic Church in America. Albany: Sixth annual convention of the Societies for the Prevention of Cruelty. Philadelphia: Launch of the United States cruiser Brooklyn from Cramp's shipyard. Italy: Twenty-fifth anniversary of the plebiscite: a number of pardons are granted in honor of the occasion.

3. Newport: Charles B. McDonald wins the national golf championship.

4. Trial trip of American liner St. Louis; she makes 20 1/2 knots. Salt Lake City: Sixty-fifth semiannual conference of the Mormon Church. England: Prorogation of Parliament till Dec. 23.

5. New York: Yale defeats Cambridge by winning 8 out of 11 athletic contests.

6. A note of remonstrance addressed to Turkey for her action in Armenia by the western European powers.

7. Washington: Decision reached by the district court favorable to the Government in the famous Potomac Flats case, involving several million dollars. Chicago: Electric car held up in the suburbs by masked men; all the passengers robbed.

8. Indiana: Defeat of the Republicans in the municipal elections, probably due to rigid enforcement of the excise law. Atlanta: Meeting of the American Institution of Mining Engineers, also of the Southern Irrigation Congress; the Liberty Bell is received at the exposition grounds with great ceremony.

9. Syracuse, N. Y.: Triennial convention of the Congregational Church. Easton, Pa.: Convention of the Evangelical Lutheran Church.

10. Washington: Major Ames released from arrest and Gen. Schofield censured by Judge Bradley of the district court.

11. By request of Minister Terrill the United States cruiser Marblehead is ordered to the Gulf of Alexandria to protect American interests.

12. Atlanta: The National Congress of Farmers adopt resolutions favoring reciprocity with the South and Central American states; H. F. Clayton, of Indiana, is president of the congress. California: In the Court of Appeals a decision is rendered favorable to Mrs. Leland Stanford in the suit brought by the Government against her husband's estate. Korea: Marines land from the Yorktown to protect the American legation.

13. Turkey: Further cases of cruelty and bloodshed are reported in Armenia and other of the provinces.

14. Washington: Meeting of the Supreme Court. Baltimore: Meeting of the American Purity Alliance.

15. London: Publication by Lord Sackville-West, once minister to the United States, of a pamphlet reflecting upon Mr. Bayard, now United States minister to the court of St. James. Brooklyn: Eighty-sixth annual meeting of the American Board of Commissioners to Foreign Missions. Atlanta: Twenty-first session of the American Bankers' Association.

16. St. Louis: Meeting of the American Institute of Architects. Washington: Annual convention of the Military Society of the Loyal Legion. Gen. John Tilden elected commander in chief. Turkey accepts proposed scheme of reform, but the massacres continue. Milwaukee, Wis., celebrated her fiftieth birthday.

17. Washington: A national convention of colored men denounces Cleveland's administration, declares adherence to the Republican party, and favors McKinley for President. Minneapolis: The Episcopal House of Deputies rejects a report looking toward the unity of the different churches.

18. Trial trip of the United States battle ship *Indiana*; she makes 15½ knots, winning a handsome premium for her builders. Baltimore: Twenty-second convention of the National Women's Christian Temperance Union.

19. Newport News, Va.: Launch of United States gunboats *Nashville* and *Wilmington*. England sends an ultimatum to Venezuela demanding reparation for arrest of British officials.

20. Rear-Admiral Kirkland relieved from the command of the Mediterranean squadron; he is succeeded by Commodore Selfridge. Washington: Biennial session of the Supreme Council of the World Thirty-third Degree Masons.

21. Arrival of the President and party at Atlanta to celebrate what has been designated as "President's Day." Minneapolis: Adjournment of the Episcopal General Convention. Baltimore: Re-election of Miss Frances E. Willard as President of the Women's Christian Temperance Union. Meriden, Conn.: General conference of the Universalist Church of the United States. Vicksburg, Miss.: Meeting of the Deep Water-ways Convention. Great Britain sends to Venezuela an ultimatum regarding the arrest of British officials. Austria: Opening of the autumn session of the Reichstag.

22. Secretary Carlisle orders the stoppage of silver mintage after November 1. England: C. D. Rose withdraws his challenge for the America's cup.

23. Atlanta: Meeting of the Manufacturers' Association. 300 delegates present from New England, 300 from the Southern States. A train on the Lake Shore Railroad runs from Chicago to Buffalo, 510 miles, at an average of 53½ miles per hour, excluding stops.

24. Cleveland, Ohio: Annual convention of college alumni. New York: National Congress of Freshinkers. S. P. Putnam, of Chicago, elected president. Armenia: Continued massacres of Christians by Turks are reported, and no efficient measures taken for their protection.

25. Arrival at Washington of Sir Charles Tupper and the Hon. Mackenzie Bowell, of Canada, to take part in the Bering Sea negotiations.

26. The postal deficiency for the fiscal year officially stated at \$2,807,044. Atlanta: The National Congress of Women discusses suffrage. Paris: Resignation of the French Cabinet, the House of Deputies having passed a vote of censure.

27. South Carolina: The Constitutional Convention decides against woman's suffrage by 121 to 24. Washington: The Commissioner of Pensions reports 225 convictions for frauds during the year. Cuba: Alleged landing of a filibustering expedition from Canada.

28. New York Bay: The fort at Sandy Hook is formally named Fort Hancock by the Secretary of War. Texas: Negro lynched at Tyler. France annexes two of the Society Islands. Scotland: End of the shipbuilders' strike at Glasgow and Belfast; wages advanced 5 per cent.

29. Washington: Grand jury of the District of

Columbia declares the Government printing offices in an unsafe condition. The Bank of England pays the first installment of the Chinese indemnity to Japan, £2,000,000 sterling, the money remaining in bank, probably for the purchase of naval and military stores in England.

November 2. Trial trip of the United States war ship *Katahdin*. She fails to make the required speed. A board of officers recommends her acceptance at a reduced cost. Chicago: Mr. J. D. Rockefeller gives to Chicago University \$1,000,000 unconditionally and \$2,000,000 conditioned upon receipt of a like sum from other sources. Francis M. Hatch appointed minister to the United States from Hawaii.

4. Alaska: Canadian police fortifying strategic points along the border. Promotion of Commodore Selfridge, U. S. N., to be rear admiral.

5. Pittsburg, Pa.: Dedication of Carnegie Music Hall, Library, and Art Galleries; a further endowment of \$1,000,000 promised.

8. Washington: Civil-service rule extended to include many post offices and their employees.

17. China: Retrocession of the Liaotung peninsula, the Japanese receiving 30,000,000 taels.

18. Sentence of members of the American Railway Union connected with the strike of 1894 by the Supreme Court. This is in confirmation of the sentence of the California Court, and they must serve eighteen months in prison.

20. Departure of the United States steamship *Minneapolis* for Turkish waters.

28. Thanksgiving Day: 100,000 persons present at the Atlanta Exposition.

29. Rome: The Pope creates Monsignor Satali a cardinal.

30. During the whole month murders of Armenian Christians continued without efficient effort at restraint on the part of the Sultan. The fleets of Europe remain at anchor near the Dardanelles awaiting orders for action. Several thousand Armenian Christians have been massacred.

December 2. Meeting of the Fifty-fourth Congress.

3. Germany: Opening of the Reichstag.

4. Adjournment of the South Carolina Constitutional Convention, its work having been completed.

10. Turkey: The Sultan grants permission for extra guard ships of the European powers to enter the Bosphorus.

12. Switzerland: Adrian I. Chenal elected President of the republic. Great Britain: Parliament prorogued until February.

14. Election of Samuel Gompers President of the American Federation of Labor.

17. Washington: A message to Congress from the President regarding the boundary dispute between Great Britain and Venezuela causes instant apprehension of war and unsettled financial markets all over the world. Philadelphia: General strike of the employees of the street railway lines with riotous proceedings and many arrests.

20. Philadelphia: Street-car strike declared off. Ninety indictments have been found against rioters.

21. Celebration at Plymouth, Mass., of the two hundred and seventy-fifth anniversary of the landing of the Pilgrims. An oration delivered by Senator Hoar.

EXPOSITION, COTTON-STATES AND INTERNATIONAL. This great fair, held in Atlanta, Ga., during the closing months of 1895, in importance ranks third among those held in the United States; and in some of its features, as in the display of electrical apparatus and inventions, it even surpassed the Centennial. It had its origin in the fact that the South, with its wonderful agricultural, mineral, and manufacturing resources, was not adequately represented at Chicago in 1893, the legislatures of the Southern States being prohibited by their several constitutions from making appropriations to

that end. It had also the further object of fostering the trade relations already existing between the Southern States and the Latin-American republics and promoting commercial intercourse with Europe.

Finance and Administration.—This Exposition was inaugurated by private enterprise, the originator of the idea being Col. W. A. Hemphill, business manager of the Atlanta "Constitution." The citizens of Atlanta subscribed \$225,000, the City Council appropriated \$75,000, and the county (Fulton) gave convict labor to the amount of \$50,000. A committee (which contained three negro members, Prof. Booker T. Washington, Bishop W. J. Gaines, and Bishop A. Grant) visited Washington to request an appropriation of \$200,000 from Congress for a Government building and exhibit, which was passed on June 30, 1894. The Legislature of Georgia voted \$17,500 for an exhibit of the agricultural and mineral resources of the State; but the first State to take official action of the kind was Louisiana. In addition to the \$350,000 raised, the revenues calculated upon were: issue of bonds based on a mortgage upon two thirds of the gate receipts, \$300,000; returns from sale of 100,000 square feet of floor space at \$1 a square foot, \$100,000; concessions, \$200,000; and gate receipts, estimated at \$1,500,000. By Nov. 1, 25 per cent. of the face value of the bonds was reimbursed to the bondholders. On Nov. 4 Samuel M. Inman, one of the foremost promoters of the enterprise, headed a subscription list with \$50,000 (half of the amount required) to pay off the floating debt.

Invitations to participate in the Exposition were sent to foreign countries through the State Department of the United States, and commissioners were appointed to Mexico, Central and South America, and a commissioner general to Europe, with headquarters in London, under whose direction special commissioners were sent to Great Britain, France, Germany, Italy, Austria-Hungary, Belgium, and Russia. The regulations issued by the Treasury Department governing the free importation of articles for exhibition at the World's Columbian Exposition at Chicago, and all other regulations governing the customs business at that Exposition, were applied to this Exposition, so far as practicable, the grounds and buildings constituting a bonded warehouse and the leading transportation lines being bonded from the principal ports to Atlanta. The Pacific Mail Steamship Company agreed to transport free of charge all exhibits from points in Central and South America reached by its lines. Fourteen States of the Union and the District of Columbia participated through their legislatures or principal commercial bodies, 7 having buildings of their own. Fourteen foreign countries were represented, those of Europe unofficially. The total cost of the Exposition was placed at \$2,090,000, and it is a notable fact that in every instance the cost of constructing the buildings came within the estimate given.

Location.—The site was Piedmont Park, 2 miles from the center of the city, an inclosure of 180 acres, traversed by the rifle pits over which Sherman threw the first shell into Atlanta thirty-one years ago. The grounds were not level, as were those of Chicago and Philadelphia,

but hills formed a natural cup in which an artificial lake, named "Clara Meer," was constructed, which covered 13 acres, while the buildings crowned the surrounding elevations. Nearly all had water frontage. Gondolas and electric launches plied on the lake, and in it rose an electric fountain, designed by Luther Steiringer. The landscape effects were especially fine. In front of the lake stretched a plaza reached by broad terraces and traversed by wide gravel walks. A happy effect was produced by the paving of the avenues with crushed blue limestone, and further ornamentation consisted of fountains, statuary mounted on high pillars and balustrades, and electric lights in the evening. The architectural effect of the buildings was secured by lines rather than by ornamentation, and the materials used were simply lumber, glass, and shingles. The color scheme, which was very pleasing, was confined to a Puritan gray body for the main buildings, with white trimmings and moss-green roofs. The Fine Arts Building was white. The leading idea was Romanesque. Much bas-relief work was done in exterior decoration, and on the buildings appeared the seals of the 11 cotton States. In the interior decoration were employed cotton, corn, various cereals and grasses, and Spanish moss. The superintendent of construction was Grant Wilkins, of Atlanta, and the supervising architect was Bradford L. Gilbert, of New York, who designed 10 of the 13 larger buildings. The grounds were reached by several lines of electric cars, and also by a steam railway. The total amount expended on the grounds was \$300,000.

Inauguration.—The formal opening of the Exposition took place Sept. 18. The procession that entered the grounds at one o'clock was led by Col. W. L. Kellogg, of the United States army, and in line were the Fifth Regiment, United States army, the Washington Artillery, of New Orleans, commanded by Col. John B. Richardson, the Fifth Regiment of Georgia, and various visiting State troops, including the Second Battalion of colored infantry and the colored Guards from Macon. In all there were 25 companies, with 5 bands. On reaching the Auditorium building, where the ceremonies were held, Gilmore's band rendered the "Salute to Atlanta," composed for the occasion by its leader, Victor Herbert; prayer was offered by Bishop Cleveland K. Nelson; an ode written by Frank L. Stanton was read by Col. Albert Howell; the president of the Exposition, Charles A. Collier, delivered the opening address, and was followed by Mrs. John Thompson, President of the Board of Woman Managers, in behalf of the Woman's Department. Booker T. Washington, principal of the Tuskegee Normal Institute, then spoke for the Negro Department. Mayor King spoke for the city, and at a late hour the electric button that set in motion the engine in Machinery Hall was pressed by President Cleveland in his cottage at Gray Gables, Mass.

The Administration Building.—This included the main entrance, from Fourteenth Street. It was a composite in architecture, being a reproduction of portions of Blarney Castle, the Tower of London, Warwick Castle, the Rheinstein in Germany, and St. Michael's on the coast of Brittany. An iron-spiked portcullis

GENERAL VIEW OF THE EXPOSITION.

MANUFACTURES BUILDING.

ADMINISTRATION BUILDING.

Commissioner of Agriculture, Mines, and Manufactures, assisted by J. C. Colquitt, Speaker of the Arkansas Legislature. The exhibit of Louisiana occupied the northwestern end of the building, and was in charge of Prof. W. C. Stubbs, head of the experimental station system of the State. While one of the last that entered the list, this exhibit was one of the most complete. North Carolina's exhibit of tobacco was made in a room finished in tobacco of various colors. In the rear of the building was the exhibit of live stock.

The Minerals and Forestry Building was the most unique and original in point of design of all the buildings. It was constructed entirely of woods of the South in their natural condition, with the bark undisturbed. The sides and ends of the building were covered with various kinds of bark, and the entrances were elaborately ornamented with twigs and small branches, festooned with moss. The whole had a length of 320 feet by 80 feet, with an imposing octagonal center 80 feet in diameter, extending 30 feet above the roof, on which a garden was constructed, with sides of palms and palmettos. From this roof garden the view was superb, and it was one of the chief banqueting resorts of the Exposition. The selection of exhibits in this building was made under the direct supervision of Dr. David T. Day, of the United States Geological Survey, and Dr. B. E. Fernow, Chief of the Division of Forestry of the Department of Agriculture. Of the 26,000 feet of floor space, 3,000 in the center of the building were given to forestry. Not only were the minerals of the South represented by a great variety of specimens, but a series of immense oil paintings, each 120 feet long, showed the geological formation of the Appalachian region, on a scale of one foot to the mile. These covered the ceiling of the mineral half of the building, and on the floor below were the minerals indicated as belonging to the sections, arranged by States in one direction and by classes in the other. Most valuable, of course, were the coal and iron exhibits; and, indeed, in the collection of coal from the various important seams in Alabama, Tennessee, Kentucky, West Virginia, Georgia, and North Carolina the Cotton States and International Exposition was held to have exceeded any previous exposition. At no time in the history of expositions, it is claimed, has such a comprehensive collection of coal sections been shown, the value of a "section" lying in the fact that its height represents the full thickness of the vein from which it is taken. The largest coal section ever mined in the United States was shown; it was 11 feet 6 inches high and weighed 5 tons, having been taken from the big vein at Elk Garden, Va., where several weeks were consumed in mining it. The display of iron ores and products began with the first blast furnace ever built in the United States—on the banks of Rappahannock river, in Virginia, which was shown by a model of that old ruin together with some of the ore, fuel, flux, and pig iron made. The clay products, which were conspicuous, were ranged along two sides of the building, and included many varieties, from those of Rock-wool pottery to the earthenware household industry of Jugtown, N. C. The fact that the gran-

ite quarries of Stone mountain in Georgia, are filling an order for 2,500,000 cubic feet of granite to Baltimore, in competition with the well-known granite of Fort Deposit, Md., only 40 miles distant, and accessible by water transportation, testifies to the resources of the State in building stone, and the great industrial development in this line. Not only was a great diversity of ornamental building stone shown in the rough at the Exposition, but columns turned, fluted, and carved showed that much money and talent had been invested in quarries and dressing-plants in the South. The resources in road material were also illustrated. In the center of the Maltese cross into which the exhibit space was formed by the arrangement of aisles, stood a large case containing a complete collection of Southern gems, including diamonds, and showing the existence of fine rubies and sapphires in Georgia and North Carolina. This collection was made by George F. Kunz, of New York. A collection of Southern fresh-water pearls was included. The possibilities of the representative refractory ores that were shown, particularly those of the Carolinas, under the new processes for treating them, were particularly suggestive. Much interest attached to the exhibit of monazite sand from North Carolina, where it was recently found and is now mined on a large scale, superseding that formerly obtained only from Brazil at an exceedingly high cost. Its principal use is in the manufacture of the Welsbach incandescent gas burner, and the exhibit included the lighting of the entire building by the Welsbach Company. Another exhibit from the same State was that of the manufacture of acetylene gas. The manufacture of aluminium from Georgia bauxite ore was also exhibited, as was the progress of asbestos from the crude rock to the finest textile products. The only State north of Mason and Dixon's line that made a display of its mineral resources in this building was Pennsylvania. The entire economic exhibit of the United States Geological Survey was here made, and included a statistical column 40 feet high, showing the total production of each mineral in the South for every minute in the year. The most prominent feature was a cube of coal 11 feet on each side and weighing 55 tons, which was surmounted by a cube of iron 4½ feet on each side, weighing 7 tons, and above this was a huge barrel of petroleum containing 305 gallons. Opposite this column rose a similar one showing the quantity of wood cut for each second of time during the year in the 14 Southern States. The base, representing the amount of wood of all kinds cut for all purposes, contained 275 cubic feet. The second block presented the amount cut for lumber, and contained 35 cubic feet; while the others, in their diminishing succession, stood for the amount cut of the different timber trees of the South, beginning with the long-leaf pine, in 4 pieces, each 18 inches in diameter and 30 inches high. Parallel lines on the successive blocks showed the proportion of the product of each State, Tennessee being first in the total amount of wood cut and in the amount cut for lumber.

In addition to maps, charts, and other graphic illustrations, a series of 20 monographic displays presented each of the great lumber-pro-

daring trees, in monster frames made of the trees themselves. More than 180 different kinds of Southern trees were represented by sections of the wood, botanical specimens, and descriptive labels. A series of exhibits such as have never before been attempted in the history of expositions was made of lumber displays. A machine for testing the strength of timber was in operation, which proved conclusively that no strength is lost by bleeding pines for turpentine. This demonstration will, it is estimated, add at least \$2,000,000 to the value of the turpentine products of the South. One of the most important exhibits was a set of three models. The first represented a 160-acre farm in the hill lands of the South deprived of its protective forest cover, eroded and gullied by rushing waters. The second showed the method of re-vegetating such a farm; and the third showed it as it should be, with proper proportions and locations of field, forest, and pasturage. Illustrations were given of trees that it is desirable to introduce into the South, notably the eucalyptus, for the protection of the orange groves of Florida; the cork oak, along the Gulf; and the wattle tree, for tanbark. Michigan made a display of veneers of the finest curly woods in sizes such as have never before been polished. Products of woods were also shown, of every form and variety, from the cradle in which Thomas Jefferson was rocked to a full-sized 18-foot church organ.

The Machinery Building, 486 feet long and 100 feet wide, had a floor area of 47,800 square feet. The roof, 30 feet high, was supported by heavy trusses, and large windows and skylights afforded ample ventilation and light. The building had four distinct fronts, each in a classical style, modified to suit the materials used. It stood at an altitude of 928 above sea level, and fronted north upon the lake. A basement 8 feet deep contained all the provisions for shafting and countershafting, so that all the space overhead was preserved clear. The power plant was contained in an annex building. About 4,000 horse power of engines were shown. A clarification plant in operation for the reduction of gold from the native auriferous rocks possessed special interest.

The Transportation Building, on the eastern shore of Clara Meer, was the next large structure in order. It was 433 feet long and 126 feet wide, with two end galleries 48 x 117 feet each, and covered a floor area of 55,000 square feet. Five towers in the center rose to a height of 80 feet, and with lofty porticoes afforded an extensive view of the grounds and surrounding country. Two tracks were laid the entire length of the building, and in addition to the handsome exhibits of locomotives, steamships, cars, carriages, wagons, bicycles, trucks, etc., was shown a model of the projected Nicaragua Canal, 14 x 40 feet, such as was exhibited in Paris. The progress of the South in matters of transportation during the past quarter century was traced, and a historic interest attached to the war engines of the Western and Atlantic Railroad.

The Manufactures and Liberal Arts Building was, naturally, the largest of all. It was 470 feet long and 216 feet wide, covering 103,

000 square feet of floor space. It overlooked the plaza in a southeasterly direction and commanded a view of every part of the grounds. At each corner towers three stories high added to the general effect, while the interior was one immense hall, finished in natural woods. There were galleries round all the sides, and a clear-story of 85 feet, the roof being supported by massive and gracefully turned trusses. Flags, streamers, gonfalons, and banners of all nations floated over exhibits of endless variety; the exhibits of many of the foreign countries being installed here, with those of the several States, and many individual exhibits. On the broad balcony, which extended along the four sides of the building, were arranged in at least 100 sections the educational exhibits—from many of the larger colleges and from the public schools of a score of cities.

The Electricity Building, which occupied one of the best locations on the grounds, contained perhaps the most remarkable electrical display ever seen, in view of the inventions made within the past two years. This building had a floor area of 21,000 square feet, being 262 feet long and 80 feet wide, with wide-arched portals and a central dome 60 feet in diameter, rising to a height of 100 feet above the floor line. In the evenings thousands of electric lights, great and small, reflected the outlines of the beautiful structure in the waters of the lake.

The United States Government Building occupied the most conspicuous position on the grounds. This faced the south and overlooked the plaza, which lay at least 60 feet below the level of its foundation. From its balconies every portion of the grounds and of each separate building was within easy view. It was 260 feet long by 180 feet wide, with an annex 140 x 80 feet, which gave a total area of 58,000 square feet. There were no galleries, and no part of the building was utilized above the ground floor, with the exception of three small rooms used for offices. The cost was \$50,000, and it was designed by and erected under the supervision of the supervising architect of the Treasury Department. The exhibit, which was in charge of Hon. Charles W. Dabney, Jr., Assistant Secretary of Agriculture, was the finest the Government has ever sent out. Every executive department was represented. The State Department made practically the same exhibit as at Chicago—of historical documents, state papers and treaties, portraits and relics, the seal of the United States, with illustrations of its development, the inner workings of the President's office and of the department itself in the form of letters to diplomatic officers, and documents of the consular service, as well as a map showing the growth of our official representation abroad. The Treasury showed specimens of money, bonds, and other Government paper, together with a coin-stamping machine in operation, statistical charts and diagrams, 28 portraits of the Secretaries of the Treasury from 1789 to 1893, models of lighthouses, illuminating apparatus, fog signals, etc., of the United States lighthouse establishment, while the life-saving station, with a crew and life-saving apparatus, was in a separate building on the banks of the

lake and gave exhibitions from time to time. The Patent Office, Bureau of Education, Indian Office, and Geological Survey, all under the Interior Department, filled the spaces allotted to them, the Patent Office sending, in particular, a series of models relative to cotton manufacturing and illustrations, never before exhibited, of the manufacture of glass and pottery and agricultural machinery. The United States Geological Survey made an elaborate display of the geological wealth of the whole South, especially of the Piedmont region. Work of the Indian schools was shown. Upward of 10,000 square feet were allotted to the United States Fish Commission, the aquarium of which was arranged in a grotto with the aisles lighted from the water. Both salt-water and fresh-water fish were exhibited, with all the methods of propagation, especial effort being made to show the food and game fishes, as well as the curious fishes of the South. The Agricultural Department, likewise, paid special attention to the fruits of the country, particularly the orange and citrus fruits, which were represented by models. Diseased conditions were set forth, together with the insects inimical to plant life, and the chemicals and instruments used to exterminate them. The cotton plant was fully treated in a similar manner, in a series of facsimile models. Diseases of animals were traced also. The Weather Bureau presented a full set of its working apparatus. The exhibits of the War and Navy Departments were contained in the annex. That of the War Department included many rare Revolutionary and other historic relics, battle flags, etc., while the arms and accouterments from the earliest days of the nation to the present were shown, with all forms of army wagons, pack mules, ambulances, many of them used on historic fields, with models of harbors and river works, and a field-signal outfit. Relics of arctic exploration found place here. In addition to the full illustration of the growth and history of the department, two companies of infantry remained in camp on the grounds to present the tactics, regulations, and discipline of the army. Models of our navy, from the earliest ships to the latest armored cruiser and battle ship, were shown by the Navy Department, with all the guns and projectiles in use in modern warfare, and on the dome of the building was placed one of the powerful search lights of our battle ships, which assisted in the illumination of the grounds. The entire postal service of the Government from the earliest times was exhibited, with all mailing equipments, the workings of the dead-letter office, and a collection of all the stamps ever issued by the Government. The Department of Justice presented portraits of all the Attorneys-General of the United States from the time of Randolph, in 1789, many of whom were Southern men; while a series of photographs exemplified the discipline, employment, etc., of Federal prisons and prisoners. To the Smithsonian Institution and National Museum were assigned 5,200 square feet, the purpose of the exhibit being to convey an impression similar to that which they would receive in visiting the Smithsonian buildings in Washington. In point of value it was generally conceded that the exhibit

of the Government at Atlanta exceeded that made at Chicago, at about one seventh of the cost.

The Fine Arts Building, occupying the highest site in the grounds, was the most showy of all the buildings, and the only one finished in white. It was designed by Walter T. Downing, of Atlanta. It consisted of a main central building, with colonnade entrances, and two wide wings entered through semicircular porticoes on the north and south sides. The exterior was covered with cement plaster, and on the frieze appeared the names of noted architects and artists elaborately done in aluminite staff work. The interior presented three large galleries, the main one 110 feet long, 50 feet wide, and 40 feet high, and surrounded by a 12-foot balcony. The wing galleries were 50 feet wide, 100 feet long, and 20 feet high. The total wall space for hanging purposes was 30,000 square feet, while the ground area covered was 21,000 square feet. In comparative merit this department was one of the weakest of the Exposition, though many famous paintings were to be seen, and many excellent statues in bronze and marble.

The Fire Building served the double purpose of housing a modern and thoroughly equipped fire department and that of exhibiting all manner of apparatus and fixtures for protection against fire. It had a main frontage of 189 feet and a depth of 50 feet, and was connected with all the Exposition buildings by the Gamewell alarm system. A firemen's tournament was held here Oct. 11, in which 11 companies participated.

The Woman's Building, which competed with the Art Palace for the distinction of being the most beautiful structure on the grounds, stood in the center of the amphitheater, between the plaza and the lake. It was designed by Miss Elise Mercier, of Pittsburgh. It was three stories high, in pale yellow and white, surmounted by a compressed dome, upon which stood a female figure of Enlightenment, with uplifted torch. There was a simplicity in its pure Greek design which made it unique among the buildings of the Exposition. The broad portico in front was supported by large columns. Its dimensions were 150 by 128 feet, and the dome was 90 feet high. All prominent pedestals of the roof balustrade were crowned with statues symbolic of woman. An annex building received the overflow of exhibits. The Model School Building also contained a portion of those belonging to the Woman's Educational Department. One large room in the building, used for exhibition of the finer arts, was fireproof. The most original feature was the practical illustration of the industrial and applied arts, woman being shown as engaged not only in the occupations conceded to her sex, but in those wherein she has trenchoned upon the domain traditionally masculine. In the department of household economics was shown an exhibit of cooking by electricity. A library of books written by women was contained in the main building, and their musical compositions, magazines, patents and inventions, together with art work in all the innumerable forms of needlework, painting sculpture, architectural designs, etc., received recognition, as well as their progress in the several professions.

TRANSPORTATION BUILDING.

ELECTRICITY BUILDING.

ART BUILDING.

The Negro Building. the movement for which was begun by colored leaders and heartily encouraged by the Exposition management, was at the southeastern corner of the park, at the main entrance for Jackson Street, and covered 25,000 square feet, being 276 feet long and 112 feet wide, with a handsome front, large windows, four-cornered pavilions, and a central tower 70 feet high. The pediment above the main entrance was artistically decorated in stucco, with figures and groups representative of the life and character of the colored people. The building was the work entirely of negro labor, the contract for it having been let to two colored contractors. The total cost was \$10,000, which amount was paid by the Exposition Company, although the negroes proposed at first to erect their own building if allowed space upon the grounds. Floor space was given to chess trees, and appropriations were afterward made for a colored public-comfort department and for hospital purposes. I. Garland Penn was chief commissioner for the negro exhibit, and the result of this first opportunity of the kind vouchsafed the race was most creditable. Fourteen States were represented in the Negro Building, the exhibit made by the District of Columbia alone costing \$10,000. Thirty models of inventions by colored men were sent to the building by the Patent Office at Washington; the colored schools had an admirable showing, notably the industrial institutes of Hampton and Tuskegee; while the fine arts were not neglected. A statue by W. C. Hill, of Washington, of a negro, representing a negro with "hands broken, but not off," was pronounced remarkably fine, as was a bust of Charles Sumner by Edmonia Lewis. Several paintings of merit were also shown, much decorative hand work by colored women, and even a medical formula and set of surgical instruments of original design by a colored woman physician of Chicago. Exhibits were also made of books written and newspapers conducted by colored men. An autograph copy of the Emancipation Proclamation, written by President Lincoln at the request of the Ladies' Sanitary Commission, and a draft of the Civil Rights bill in the handwriting of Charles Sumner, were sent from Chicago.

The Georgia State Building, facing the Auditorium, was three stories high. The entrance from the plaza was in the basement, while the main entrance, from the west, was on the second floor, on a level with the Administration drive. The building had a frontage of more than 200 feet, with a central dome 100 feet high, over which appeared the model of the coat of arms of the State, "Wisdom, Justice, and Moderation," and on the pediment above the entrance was a bas-relief of its founder, James Oglethorpe. It contained a fine epitome of the native products and manufactures of Georgia, with a good representation of its progress in education, including the exhibit of the State Institute of Technology. Above the balcony, which extended entirely about the building, a series of eight paintings, representing life on Southern plantations, formed a deep and effective frieze. Many interesting relics of the war were to be seen, and near the building stood the "battle-scarred oak" of Kenesaw mountain, from Cobb

County. Perhaps the most striking exhibit was that of an immense block of Georgia marble, 20 feet long, 4 feet wide, and 2 feet 6 inches thick, surmounted by 2 smaller blocks upon which was balanced a globe, 4 feet in diameter, of polished marble.

The Georgia Manufacturers' Building, which was erected by the recently organized association of the manufacturers of the State, presented the first effort ever made to illustrate the industrial progress of a Southern State. It was near the Jackson Street entrance, just south of the Transportation Building, and though it was not so large as many of the buildings, its massive central gable and large towers gave it a fine appearance. Its dimensions were 254 x 84 feet, and its architecture suggested the later Spanish Renaissance. It contained every kind of cotton and woolen fabrics, sawmill, flour and grist mill machinery, pumps, gins and cotton presses, cotton-seed oil and by-products, with fertilizers and the various ordinary lines of manufactured goods.

Other State Exhibits.—Besides Georgia, the following States participated: Alabama, Arkansas, California, Connecticut, Florida, Illinois, Louisiana, Mississippi, New York, North Carolina, Pennsylvania, South Carolina, and Tennessee, and the District of Columbia.

The largest appropriation of any State was made by Pennsylvania, which gave \$25,000, about equally divided between the cost of its building and its exhibit. The Pennsylvania Building was pronounced by some the finest of all the structures. It was low, finished in pure white, with a broad-tiled veranda and a double portico extending forward from each end of the building. In it stood the Liberty Bell, and among the interesting documents displayed was the original indenture or quit-claim deed given by James, Duke of York and Albany, to William Penn. Like most of the State buildings, it was arranged and utilized solely as headquarters for the commissioners, and a resort for those visiting the Exposition from the Commonwealth. The State exhibit of birds and animals was placed in the Manufactures and Liberal Arts Building, and was very fine. It was valued at \$15,000. The work done in teaching the deaf was also shown, and was of much interest.

New York and Massachusetts expended each \$25,000 on a building and exhibit, the former State erecting also a cottage that presented a model workman's home, intended as an object lesson in household economies, showing the comfort and pleasure to be derived from an income of \$500 per annum. The New York Building, which was of stone and cost \$12,000, was on the site of the Piedmont Driving Club, and after the Exposition was over passed to that club by arrangement to be used as its club house.

The Illinois Building, on which was expended the total appropriation of \$15,000 made by the State, was of a bright canary color. It was in the extreme northeastern portion of the grounds, on the high bluff overlooking Peachtree creek. Near it was the Massachusetts Building, of a colonial yellow color, and the Alabama Building, for which \$20,000 was raised by private subscription, and which held a magnificent representation of the State's natural and developed resources. The appropriation made by Con-
 nection

total of \$7,000 was not expended upon a building, but upon numerous exhibits in Machinery and Manufactures buildings. The exhibit of Louisiana, for which \$10,000 was appropriated by the Legislature, included more than 100 varieties of sugar-cane stalk, rice in all its forms, 80 varieties of corn, ramie and jute, Perique tobacco (from the parish of St. James, where it is exclusively grown), cypress wood (of which this State cuts 800,000,000 feet yearly) salt (from the mines on Avery Island, one exhibit of which was a gigantic statue, cut from a single block of salt and weighing 5 tons, representing Lot's wife), and lumps of sulphur from the vicinity of Lake Charles. On Louisiana day car loads of sugar cane were distributed. In the Louisiana room of the Woman's Building was exhibited a picture of the only woman to whom a public monument has ever been reared in America, the philanthropic Margaret Haugherty, of New Orleans.

South Carolina was represented by private enterprise. North Carolina sent, among other things, the entire collection from its State Museum. Arkansas spent her total appropriation of \$10,000 upon her exhibit, and a similar amount was given by Mississippi. California raised \$35,000, having a building of her own of the old mission type, on the south side of the grounds, near the Southern Railway entrance, which was erected under the auspices of the Los Angeles Board of Trade, while the State Board of Trade sent the material collected for the Chicago fair at a cost of \$100,000, which was installed in the Manufactures Building. On the exhibit of Florida \$25,000 was expended. It was contained chiefly in the building of the Plant System of railways and steamships, in the form of a pyramid 100 feet square at the base and 60 feet high, veneered with phosphate as a roof covering, Florida rock on two sides, Florida pebble on the third, and South Carolina phosphate on the fourth. It was entered by wide doors on the four sides, and the interior consisted of a room 100 feet square and 20 feet high. Another notable exhibit was made by the Southern Railway in a building of its own, octagonal and ornamented with bas-reliefs in plaster, showing the progress of transportation from the days of the stagecoach to the vestibule train. The exhibit of the resources along the line of this railway was very fine, and the total cost of the building and its contents was \$25,000.

Foreign Exhibits.—No European nation was represented officially, but half the space in the Manufactures and Liberal Arts Building was occupied by exhibits from those nations. Italy, which sent the largest number, showed important and beautiful collections of marble statuary, carved and artistic furniture of all descriptions, decorated panels and drawing-room ornaments, artistic bronzes, Roman and Florentine mosaics, Venetian glassware, artistic majolica and ceramics, Neapolitan corals and tortoiseshell ornaments, Roman cameos, artistic jewelry, tapestries, cloth and cotton fabrics, hats, bicycles, and sewing machines, chemical and pharmaceutical products, scholastic and scientific books and publications, and a great variety of exhibits of olive oils, wines, and liquors. From Great Britain came artistic pottery, electro-plate and

silverware, cut crystals, Sheffield cutlery, Birmingham goods, Bradford woollens and cloth, Coventry cycles, pianos, furniture, chemical products, terra-cotta, statuary, ship models and railway appliances, books, etc. The French exhibit consisted of tapestries, rich drawing-room furniture, bronzes, lamps, statuary, upholstery, scientific and electrical appliances, marine and mathematical instruments, Parisian novelties, jewelry and fancy ornaments, enamels, apparatus used at Pasteur's Institute for the discovery and treatment of bacteria and bacilli, perfumery, soaps, wines, and liquors. Austria and Germany sent pianos, artistic majolica, Dresden china and glassware, cut stones, new photo-paintings and scientific apparatus and appliances; Belgium sent Brussels lace, embroideries, patent hand-stitching machines, operative exhibits of glass engraving, fancy goods, chocolates, spices, etc.; while Russia was represented by a superb collection of furs, and by stuffed bears, seals, and other animals, Russian silversmith work and enamels, carved wood, and art fabrics.

Mexico appropriated \$25,000 for an exhibit at the Exposition, which was not installed until the first week in November. It occupied 4,000 square feet in the north end of the Transportation Building. The decorative work was in the national colors of the republic, and the exhibit represented its natural and industrial products. The assortment of Mexican onyx was especially fine, and mineral ores were displayed in large quantities, as were cereals and fibrous, medicinal, and food plants. Photographs on glass traced the progress of Mexico from the time of the Aztecs, and a special feature was the collection of the idols of the Aztecs, which have never before been sent out of the country, loaned by the Mexican National Museum.

The only foreign country that erected a building of its own was Costa Rica, which, with an appropriation of \$5,000, had two pavilions in the Moorish style, on the "peninsula" facing the lake opposite Machinery Hall. In the one, fitted up as a theater, were exhibited 2,000 stereopticon views of Costa Rica, while the other, as a restaurant and coffee house, was especially intended to interest visitors in the coffee production of the country.

The Argentine Republic was the first nation to participate in the Exposition, appropriating \$25,000, and its exhibit was in the Mines and Forestry Building, occupying the whole of one end. It consisted of valuable woods, many varieties of wools, and grains of all kinds.

In the Woman's Building was an exhibit of exquisite Natute lace handkerchiefs, made by hand by the women of Paraguay.

Adjoining the Mexican exhibit in the Transportation Building was that of Venezuela, consisting of 279 samples of woods, gold quartz, copper, and admirable displays of coffee, cocoa, hides, asphalt, petroleum, coal, cotton, ramie, marble, indigo, the milk of the cow tree, etc.

The exhibit of Chili, for which \$10,000 were appropriated, consisted in a great part of the most conspicuous export of that country—nitrate of soda, a natural fertilizer.

Mexican and Japanese villages were erected by natives of those countries without Government aid. The Mexicans had a theater and a

Asian bull fight, and in the village were also exhibited some interesting archaeological remains from the ruins of Palenque. The principal amusement features were found on the Midway Heights, between Piedmont Avenue and Jackson street, and included a Cairo street, Chinese, German, and Dahomey villages, a Mystic Maze, Hagenback's trained-animal show, with a monkey house containing 740 monkeys; a Scenic railway, vaudeville theater, etc., closing with Buffalo Bill's Wild West Show. For the Chinese village, over 200 Chinese were brought from Hong-Kong. The Phoenix Wheel was modeled after the Ferris Wheel, but was much lighter, and was lighted by electricity at night. One of the special attractions was a pyrotechnic spectacular show of "The Storming of Wei-Hai-Wei."

The musical features of the Exposition included the performance on the grounds by the most celebrated musical organizations. Gilmore's, Sousa's, and Innes's bands were engaged, and Mexico sent her famous Eighth Regiment band. A chime of 13 bells was hung in a tower 150 feet high, near the Government Building and the palace of the fine arts.

The Exposition was well attended, particularly after Nov. 1. It was visited by a large crowd on Fiske and Gray day, when 25,000 men of the Grand Army of the Republic, who attended the opening exercises at the Chickamunga National Park, Sept. 19, were met by the Confederate veterans at Atlanta. On Oct. 24 50,000 people were upon the grounds when President Cleveland, with the members of his Cabinet and ladies, was received. A day was given to each of the States, when, in most instances, the governors of these States attended, accompanied by their staffs and a large delegation. Nov. 12 was Chicago day, Nov. 14 Pennsylvania day, Nov. 15 Massachusetts day, Nov. 19 Georgia day, and Nov. 25 Manhattan day. Others especially to be noted were Liberty Bell day (principally intended for children) Atlanta day, Confederate day, Negro day, Plant day, and human day. On some occasions the attendance exceeded 100,000. On Dec. 31, the day appointed, the Exposition came to an end. During its continuance many important congresses were held, notably those of the National Educational Association, held the last week in October; the Woman's Temperance Christian Union, held the first week in November; and the colored congresses, held in November and December.

The Department of Awards was presided over and directed by Dr. Daniel C. Gilman, President of Johns Hopkins University, who devised an ingenious system of making these awards, combining the best features of the individual-judge

system and the jury system. He obtained the services of experts of ideal excellence for theoretical and practical knowledge in all the special lines involved, and the awards were made upon the merits of the exhibits themselves, without regard to the general reputation of the exhibitors. The jurors selected by Dr. Gilman were distributed in groups corresponding to the ten departments under which the exhibits were classified. Medals in bronze, in silver, and (in exceptional instances) in gold were awarded for high degrees of merit. The jurors met in Atlanta on Oct. 15, and reached their conclusions by Nov. 1.

The design of the official souvenir medals of the Exposition, which were struck by the United States Mint, showed on the one side a bale of cotton, on which was perched with outstretched wings a phoenix. Under the bale appeared rays of fire with the year "1895" printed, and above were the figures "1895." Around the edges of the medal were printed the words "Cotton-States and International Exposition," and at the lower side the words "Atlanta, Ga., U. S. A., September 18th, December 31st, 1895." On the reverse was a vignette of Henry W. Grady, and around the edges the words "Official Souvenir Medal." The medals were of bronze, the exact size of a silver quarter of a dollar.

The officers of the Exposition were:

C. A. Collier, President and Director General; W. A. Hemphill, First Vice-President; H. B. Cabaniss, Second Vice-President; W. D. Grant, Third Vice-President; E. L. Tyler, Fourth Vice-President; A. L. Kontz, Treasurer; J. J. Spalding, General Counsel; A. W. Smith, Auditor; E. S. McCandless, Assistant Auditor; J. R. Lewis, Secretary; E. F. Blodgett, Assistant Secretary; Grant Wilkins, Chief of Construction and Landscape Engineer; Bradford L. Gilbert, Supervising Architect; Charles F. Foster, Mechanical and Electrical Engineer.

Commissioners:

C. H. Redding, Commissioner to Mexico; I. W. Avery, Commissioner to South America; A. Maerkl, Commissioner to Europe; Alfonso Faber, Commissioner to Austria.

The chiefs of departments were as follow:

Grant Wilkins, Construction; E. L. Tyler, Transportation; W. S. Cooper, Publicity and Promotion; I. H. Allen, Machinery; H. M. Adams, Electricity; D. T. Day, Minerals; B. E. Fernow, Forestry; Horace Bradley, Fine Arts; A. W. Smith, Public Comfort; W. J. Northen, Educational; E. A. Fisher, Admissions; James R. Wylie, Agriculture and Dairy; E. P. Chamberlain, Manufactures and Liberal Arts; H. L. Wilson, Live Stock.

There was also a Board of Directors, composed of 63 men, and a Board of Woman Managers, with Mrs. Joseph Thompson as president.

F

FARMERS' CONGRESS. The fifteenth annual session of this body met in the auditorium on the Exposition grounds, at Atlanta, Ga., Oct. 10. By previous arrangement, this meeting assumed a Pan-American form and continued for six days. This congress is the largest organiza-

tion of the kind in the world. It is distinctively a nonpolitical, agricultural organization, composed of true representatives of agriculture, appointed and commissioned by the governors of the several States and, in this instance, representatives of the German Empire, Chili, Vene-

zuela, and Mexico, by R. B. Baron von Hermann, agricultural attaché of the German legation, Señor Julio M. Foster, Señor Francisco Javier Yanes, and Señor M. Romero, minister from Mexico, in the order named.

After prayer by the Rev. Mr. Bryan, of Georgia, Hon. Porter King, Mayor of Atlanta, delivered an address of welcome, and was followed by Mr. Hunnicutt, in behalf of the Georgia Agricultural Association, and by Dr. H. C. White, in behalf of the Governor of Georgia. These addresses were responded to by Secretary Stahl, of Illinois, and by President Clayton, of Iowa.

President Clayton then delivered his annual address, in which he said:

The art of cultivating the ground and of obtaining from it the products necessary to support animal life was the first science in the development of the rich valleys watered by the Euphrates, the Tigris, and the Nile. Like the ancient settlers of the valley of the Nile, the emigrant from all civilizations came to cultivate the rich valleys in this great new continent of ours. And while they better understand the art of cultivating the soil, the mode seems primitive in comparison with the high art with which we are now blessed. Our forefathers in the beginning were farmers, carpenters, masons, merchants, and manufacturers, complete, though primitive, in the individual. First and foremost they were farmers, and used other avocations merely as incidental to the first and chief employment. Less than a half century has elapsed since the spinning wheel and the handloom were common and necessary in the American home. Fifty years ago the American farmer lived almost entirely within his own resources and within himself. He built his own cabin, constructed his own fireplace and chimney, and fashioned his own farm implements. A portion of the field was set aside for the flax, and when it was pulled, bleached, and broken, it was manufactured into textile fabric to supply the needs of the family.

As our country has been developed, the inventive genius has been called into activity, and under his inventions the American farm hand can accomplish the labor of nearly five men of the Old World, and he has so divided and diversified employment as to revolutionize the condition of things.

President Harrison, in a message to Congress, hinted that the establishment of the Department of Agriculture with its secretary as a Cabinet officer "was at the enlightened demand of a worthy class of people," and he congratulated the people on the great results accomplished by it. In a subsequent message to the same body he refers to the marvelous growth of the farming interest. He says its growth has been from \$1,343,600,000 in 1860 to \$4,500,000,000 in 1891, an increase of 230 per cent. The entire exports for the fiscal year ending June 1, 1892, reached the unparalleled amount of \$1,030,000,000, 70 per cent. or, in round numbers, \$800,000,000 of which were agricultural products, exceeding any previous year by \$150,000,000.

At the assembling of the second session of the Fifty-third Congress, Dec. 4, 1893, President Cleveland corroborated the statement of his predecessor as to the year referred to; but his message disclosed the fact that at the close of the fiscal year ending June 1, 1893, there had been a shrinkage in our exportations, nearly \$20,000,000 of which was on agricultural products. This could not be because of short crops, for the reason that the President in his message to the special session of Congress in August of the same year referred to the "plentiful crops, with remunerative production and manufacture."

In my judgment the Department of Agriculture is the most important of the Government. It represents greater interests than any single department; yet,

through all the history of the Agricultural Department, it has been characterized with timidity and a lack of boldness in demanding legislation and adequate appropriations to make the department effective.

There is scarcely a question that may be raised in this body affecting our agricultural interests but will have a political side to it, but let us discuss those questions without reference to its influence upon any political party. Let us take each other by the hand and make one common cause for our great interest.

The roll of States was called, and the following-named gentlemen were appointed a Committee on Resolutions:

Arkansas, Jeff D. Wellborn; Colorado, Lute Wilcox; Florida, T. S. Appleyard; Georgia, Dr. R. G. Norton; Illinois, Mr. O. S. Foley; Indiana, D. W. Haeggy; Iowa, A. V. Stout; Kentucky, Sam Brown; Massachusetts, W. L. Kilbourne; Michigan, J. C. Ramsdell; Mississippi, Dr. J. D. Hutchinson; Missouri, J. C. Denham; Nebraska, J. B. McDowell; New Hampshire, J. W. Sanborn; North Carolina, W. B. Meares; Ohio, W. Lawrence; Rhode Island, G. A. Stockwell; Pennsylvania, H. F. James; Tennessee, J. W. Roseman; Texas, Rev. R. F. Butler, "Uncle Snort"; Vermont, ex-Gov. Levi K. Fuller; West Virginia, J. A. Myers; Wisconsin, John Bender; Maryland, H. R. Walworth; New Jersey, Franklin Dye; New York, Lorenzo D. Collins; North Dakota, H. E. Stockbridge; Virginia, C. T. Watkins.

The next order of business was the annual election of officers for the congress: Judge William Lawrence, of Ohio, nominated Hon. Benjamin F. Clayton, of Iowa, for re-election as president. This was seconded by Georgia and many other States, and Mr. Clayton was unanimously re-elected.

Dr. R. G. Norton, of Georgia, nominated Major G. M. Ryals, of Georgia, for re-election to the office of vice-president. This was seconded by Ohio, Indiana, Alabama, Texas, and other States. The election was then made unanimous.

Dr. John A. Myers, of West Virginia, nominated for secretary the present incumbent, Hon. John Stahl, of Chicago. Texas, Indiana, Tennessee, Georgia, Nebraska, and other States seconded the nomination, and it, too, was made unanimous. For first assistant secretary, Major W. G. Whidby was unanimously re-elected.

Mr. T. J. Appleyard, of Florida, was unanimously re-elected third assistant secretary, and Mr. Henry Hayden, of Iowa, treasurer.

The following resolutions were adopted:

1. That public interests require an increase of manufactures of cotton, wool, flax, hemp, and ramie, so that as soon as practicable all the wants of these goods by American people may be supplied by the skill and industry of our own citizens; and that the only obstacle in the way of such manufacturing in the States of the South and of the great West is the want of skilled labor; therefore, as a means of enlarging such manufactures in these States, the legislatures of all the States are respectfully urged to provide a department for instruction in textile industries in one or more of the universities in each State, and especially in those endowed or aided by the land-grant act of Congress of 1862.

2. That this Farmers' National Congress is emphatically in favor of both gold and silver as money of ultimate redemption and equally as standard of value; and to secure this object we favor a conference, to be called by the United States, of those nations ready to accept bimetalism with the ultimate coinage of both gold and silver on a rate to be agreed upon. That we favor a law requiring duties on commodities the prod-

set of, or imported from, the mono-gold nations to be paid in gold coin; that we favor a law imposing duties on silver imported from mono-gold nations equal to the difference between the bullion value and the coinage value of silver at the date of the importation.

2. That we respectfully request the Honorable Secretary of Agriculture to harmonize and more closely unify the work of the crop statisticians of the weather service of the several States, and to utilize as far as possible statistics from the State organizations.

3. That American commercial and financial independence in foreign commerce, through proper balancing of trade and transportation, is of growing importance and necessity, not alone to prosperity, but to the character and destiny of the republic; therefore, the national interest, advantage, and safety require that American shipping be American built, owned, manned, freighted, and insured, to the end that our people shall have the fullest employment, and American commerce the best service and highest economy, with perfect independence.

4. Whereas, the evident prosperity of that section of our country known as the "cotton belt" is due to the fact that the farmer has become in a measure self-sustaining, and is learning to make his money crop a surplus crop; therefore we congratulate our brothers of the South on the result of their efforts on this line, to the end that their country may become rich and prosperous, as it was by Nature intended.

5. That the secretary of this body is hereby directed as far as practicable, to procure and forward to each State library one copy of all the proceedings of this congress from its commencement, and two copies to the congressional library at Washington, D. C.

6. That we have listened with profound interest to the able and instructive address of Señor Francisco Javier Yanes, on "The Commercial Relations of the American Republic," and further, that, to secure reciprocal trade between the United States and the Spanish American republics, we favor legislation for reciprocity commercial treaties and aid for steamship lines sufficient to answer all the purposes of such lines.

7. That the growth of American tobacco gives employment to a large number of persons, and by the system of the "cave" contracts adopted by foreign countries this product is shut out from an open market, except in England and Germany; therefore, we respectfully request the Honorable Secretary of Agriculture and the members of Congress to investigate this matter, to the end that, by treaty or otherwise, proper relief may be secured.

8. That a committee be appointed, consisting of one member from each State, to prepare a memorial to the legislatures of the several States, asking for sufficient appropriation to defray the actual expenses of delegates attending these annual meetings; and that the secretary of this body be instructed to forward such memorial to the proper authorities, and they be requested to present it to such Legislature when convened.

9. That during our colonial history bounties were authorized to be paid for various agricultural and manufactured products by authority of legislative assemblies; that similar bounties have since been paid in this and other countries by acts of legislatures; that similar bounties, in this and in other countries, have always been regarded as legitimate exercise of legislative functions and power; therefore, we favor the payment of sugar bounties authorized by act of Congress in 1880.

10. That the depressed condition of the staple agricultural and shipping interests demands the enactment of such legislation as will put both of these great industries upon a footing of equality with those now especially favored by the Government, and that our efforts be pledged to the furtherance of a union between the shipping and the agricultural interests; and that a select committee of five be appointed to

attend a conference to be held under the auspices of the National Grange and other bodies, in furtherance of this proposition.

11. That we demand that free mail delivery be extended to towns and villages and into the rural districts as rapidly as possible without unnecessary increase in the expenses of the department; and that we are opposed to further reduction of the present rates of postage until this is accomplished.

12. That the money in circulation in the United States Sept. 1, 1895, was in gold coin, standard silver dollars, subsidiary silver, gold certificates, silver certificates, Treasury notes (act of July 8, 1890), United States notes, currency certificates (act of June, 1875), and national bank notes, amounting to \$1,000,755,609. While eminent statesmen advocate the policy of retiring from circulation, and the cancellation of United States notes (greenbacks) and the Treasury notes, thus reducing the currency by the amount of \$556,973,415, which would be a contraction ruinous to the business interests of the country, and further aggravate the evils of the gold mono-metallicism; we are utterly opposed to any such contraction of the currency and condemn it as hostile to public interest, until such time as an adequate amount of gold and an additional amount of silver coinage shall be provided to supply all needed money for public use.

13. It is an established principle with both of the great political parties that a tariff on imported goods adequate to meet the expenses of the Government should be levied; therefore we demand the same protection for farm products that is guaranteed to other industries of the country.

14. That we memorialize the Congress of the United States for aid in protecting the country from the ravages of the gypsy moth, which has so far been held in check by the efforts of a single State.

15. That we urge upon the Secretary of Agriculture, and upon the Congress of the United States, the importance of sufficient appropriations to employ expert civil engineers to investigate the possibility and the practicability of water storage and the best system of irrigation for the reclamation of the arid and semi-arid districts in the United States.

16. That, being convinced that the improvement of the navigation of the ports on the Atlantic, Gulf, and the Pacific coasts, the lakes and rivers, and the speedy completion of the harbors of refuge now begun, are to make navigation, life, and property more secure, and that this work means cheaper transportation, cheaper food, cheaper clothing, iron, coal, lumber, and other supplies to every inhabitant of the United States, we urge the Federal Congress to make liberal appropriations for these objects in the interests of wise economy.

17. That we memorialize the Federal Congress to enact a general law against the spread of the so-called Russian thistle on the public domain, and to make sufficient appropriations for the extermination of the pest on the Government lands, and to aid States in the suppression of the pest.

18. That we respectfully petition the Federal Congress to enact such laws as will protect the dairy farmers of the country against the manufacture of filled cheese.

19. That the vast agricultural products of the West are impeded in their passage to the Eastern market by want of deep water ways connecting the Great Lakes with the sea, and the Dominion of Canada, through the aid of the British Government, is seeking to divert these products through other channels to foreign ports; therefore, we respectfully request the Congress of the United States to make sufficient appropriation to construct a continuous deep-water way from the Great Lakes to the deep waters of the Hudson river, at Albany, thereby connecting the lakes with the Atlantic.

20. That the secretary of this body is hereby directed to engross all resolutions asking for congressional legislation, and to forward a copy of the same to the President of the Senate and to the Speaker of the House, and request that the same be referred to

the agricultural committees of the two bodies, and that the same be printed and placed on the desks of the members of both houses.

Nashville, Tenn., was chosen as the place for holding the meeting in 1896.

FAURE, FRANÇOIS FÉLIX, President of the French Republic, born in Paris, Jan. 30, 1841. He was the son of an upholsterer, and was educated for mercantile life in a private commercial school, and sent to England for two years to learn the language and become familiar with English methods of doing business. He began his business career at Amboise, where he learned the currier's trade and mastered the leather business. At Amboise he married at the age of twenty-three the daughter of M. Guinet, then mayor of the commune, and in later years Senator for Indre. Settling in Havre as a commission agent and importer of hides, he became in time a large merchant and shipowner and President of the Chamber of Commerce. He once lectured on history to evening classes, and so became a ready public speaker. He was elected a member of the Municipal Council and became deputy mayor. During the war of 1870 he was sent to England by Gambetta to purchase arms for the *Franc Tireurs* and the *Garde Mobile*. As chief of a battalion of mobiles he aided in suppressing the Commune in Paris, and gained the ribbon of the Legion of Honor. The Broglie Cabinet deprived him of his office of deputy mayor in 1874, but he continued to give great attention to educational and charitable work, and rose constantly in the esteem of his fellow-townsmen, who in 1881 elected him to the Chamber of Deputies, and afterward renewed his mandate at every general election. When Gambetta formed a ministry on Nov. 14, 1881, he made Faure Under Secretary of the Ministry of Commerce and the Colonies. Jules Ferry selected him for the same post in making up his ministry of Feb. 21, 1883, which endured over two years. He returned to the office once more in the Brisson Cabinet of 1885, and a fourth time in the Tirard Cabinet of Dec. 12, 1887, the first one appointed by President Carnot. He was regarded in the Chamber, whether in or out of office, as an authority on all subjects connected with merchant shipping, foreign commerce, or colonial questions, and was marked out by experience and reform ideas for the new Ministry of Marine, to which he was called in the Dupuy Cabinet of May 30, 1894. He had also been selected to act on several committees dealing with commercial and financial questions of a more general kind, such as the Committee on Railroads and the Committee on the Conversion of the *Rente*, and was the author of a treatise on comparative European budgets. His technical knowledge, untiring industry, and progressive tendencies gave him a high reputation among politicians as a minister. The Chamber showed its regard for his character and ability by electing him regularly its vice-president. In politics he has been an Opportunist and a member of the group known as the Republican Union. In the caucus that was held by the Moderate Republicans to select a candidate for President to succeed Casimir-Périer when he suddenly resigned in January, 1895, the eminent lawyer Waldeck-Rousseau was nominated. But before

the balloting at Versailles on the following day, Jan. 17, many members of the Congress decided to vote for M. Faure, who received more votes than M. Waldeck-Rousseau on the first ballot, and was elected on the second.

FINANCIAL REVIEW OF 1895. Among the important features of the year was the ending of the war between Japan and China, the latter suing for peace, and the treaty of Shimonoseki was signed on April 30, China agreeing to pay 200,000,000 taels indemnity and ceding Formosa and the Liao-Tung peninsula. But later, through the influence of Russia, Japan relinquished possession of the latter, and she received £5,000,000 additional indemnity. Another feature was a wild speculation in South African mining shares, which began in London in May, and later extended to Continental centers, disastrously collapsing in November, and it was estimated that the losses were fully \$467,500,000. On Nov. 5, owing to reports of constantly recurring disturbances to the detriment of all nationalities in Armenia and other parts of the Turkish Empire, the ambassadors of the great powers separately went to the Porte to urge the immediate adoption of adequate measures to bring about the restoration of order, declaring that if such measures were not adopted the powers would decide in concert upon the steps to be taken. The Sultan promised reforms, and the majority of the powers remained in accord, but it was claimed toward the end of November that Russia and Germany, at least, were not disposed to act in concert with the other powers in an extremity, and the disturbances in Armenia continued to the end of the year. Another feature was the accumulation of the unprecedented sum of £44,724,581 bullion in the Bank of England, this amount being on deposit Dec. 12. Bar silver in London rose from 27 $\frac{3}{8}$ d. per ounce in January to 31 $\frac{1}{2}$ d. in October, due mainly to speculative manipulation based upon the expectation of large requirements in the far East, but there was a decline to 29 $\frac{1}{8}$ d. in December, and the price was 30 $\frac{1}{8}$ d. at the close. All Europe was in a state of political ferment at the end of the year, in consequence of the Turkish question and of complications in China and Japan; and the losses resulting from the collapse in mining shares in London and on the Continent and those incurred by the London speculators during the panic which followed the Venezuelan message of President Cleveland Dec. 18 caused more or less financial tension.

One of the most important events in this country during the year was the contract made by the Administration on Feb. 8, with Messrs. Belmont and Morgan, the former representing the London house of Rothschild & Co., and the latter the American house of J. P. Morgan & Co. and J. S. Morgan & Co. of London, for the purchase of 3,500,000 ounces of gold at \$17.80441 per ounce, to be paid for by the delivery of \$62,315,400 4-per-cent. thirty-year bonds, it being agreed that one half of the gold should be imported from Europe. On the day that the contract was signed the net gold in the Treasury had been reduced to \$41,340,181 by withdrawals for hoarding and for shipment to Europe, and these withdrawals during January amounted to \$45,117,738, and as Congress had refused to pass

New York: D. Appleton, 1914.

Al. Kinn

a bill recommended by the President authorizing a 3-per-cent. gold loan, the only remedy was a resort to the authority conferred by the act of 1862, which provided for the direct purchase of gold. Immediately upon signing the contract the Bond Syndicate arranged for the importation of gold from Europe. At the same time a sub-syndicate was formed, embracing the principal foreign bankers, several of the New York city banks, and a few institutions in the interior, for the purpose of facilitating the operations of the Bond Syndicate. The bonds were sold in Europe at £227 per \$1,000 bond, carrying a coupon of 3s. 5d. payable Aug. 1; and in America at 112½, bearing interest from Feb. 1. The contract was fulfilled June 24, but, after a large part of the gold, about \$15,500,000, had been received from abroad, the Secretary of the Treasury, in order to prevent disturbances in rates for foreign exchange at a critical period and avoid a condition which would have forced gold exports, and consequent withdrawals from the Treasury, acquiesced in a departure from the liberal terms of the contract, that one half of the coin should be procured abroad, and accepted deposits of gold then held in this country to complete the delivery. After the fulfillment of the contract the Bond Syndicate continued to make deposits for the protection of the Treasury, and between June 24 and Sept. 11 they deposited \$16,127,432.94. They had paid into the Treasury Feb. 21 \$32,558,122.31, representing the amount due on the American half of the bonds. After full payment had been accepted for all the bonds the net gold in the Treasury stood, June 28, at \$107,550,976, and on July 9 it was reported at \$107,571,230. Generally it was reduced by withdrawals of gold for export, and on Sept. 5 it stood at \$99,127,528. After the Bond Syndicate ceased to make deposits for the protection of the Treasury the reduction in the net gold continued, and at the end of the year the amount was reported at \$65,875,948. In his annual message to Congress President Cleveland called attention to the necessity for legislation for the relief of the Treasury, suggesting the retirement of the legal tenders. But this course was generally opposed, and on Dec. 28 a bill was passed by the House, providing for the issue of \$50,000,000 3-per-cent. certificates of indebtedness, to meet a deficiency in the revenue, and \$50,000,000 coin bonds to maintain the gold reserve. The bill was promptly sent to the Senate, but the measure

mainder at the option of the Government, said gold to be paid for by the issue of about \$302,000,000 4-per-cent. thirty-year bonds. There was much opposition manifested by members of Congress and by some bankers to this plan of the President, and on Jan. 6, 1896, the Secretary of the Treasury issued a circular inviting proposals for \$100,000,000 4-per-cent. thirty-year bonds, in denominations of \$50 and multiples of that sum, to be dated Feb. 1, 1895, said proposals to be received until Feb. 5; payment for the bonds to be made at any of the sub-treasuries, 20 per cent. on notice of acceptance of the bids and 20 per cent. at the end of each ten days thereafter. It was understood that a syndicate would take all of the bonds not subscribed for under this circular.

The financial situation was severely strained immediately after the Venezuelan message of President Cleveland, by reason of a war scare, during which Europeans freely sold American securities; and later there was more or less selling by foreigners, because of apprehensions of a financial crisis in this country, resulting from the opposition of Congress to the financial plans of the President.

The following tabular survey of the economical conditions and results of 1895, contrasted with those of the preceding year, is from the "Commercial and Financial Chronicle":

ECONOMICAL CONDITIONS AND RESULTS.	1894.	1895.
Coin and currency in the United States, Dec. 31.....	\$1,462,399,100	\$1,796,402,287
Bank clearings in the United States.....	\$45,615,200,137	\$29,845,807,242
Business failures.....	\$17,202,656	\$173,796,000
Imports of merchandise (year).....	\$1,012,941	\$91,200,000
Exports of merchandise (year).....	\$1,012,941	\$1,012,941
Gross earnings 120 roads (year).....	\$5,918,000	\$100,000,000
Railroad construction, miles.....	1,000	5,000
Wheat raised, bushels.....	40,000,000	407,300,000
Corn raised, bushels.....	1,512,700,000	2,251,000,000
Cotton raised, bales.....	9,000,000	6,000,000
Pig iron produced (tons of 2,240 pounds).....	6,607,000	9,440,000
Steel rails, Bessemer (tons of 2,240 pounds).....	600,000	1,350,000
Anthracite coal (tons of 2,240 pounds).....	41,801,190	46,643,201
Petroleum (runs) production, barrels.....	80,072,770	10,000,000
Immigration into the United States (year).....	240,000	200,000

The prices of leading staples on or about Jan. 1, 1896, compared with prices at the same date in 1895 and 1894, were as follow:

STAPLES.	1894.	1895.	1896.
Cotton, middling uplands, per pound.....	8	24 1/2	9 1/2
Standard shingles, per square yard.....	24	24	6
Wool, Ohio XX, per pound.....	24	17 to 18	14 to 15
Iron, American pig No. 1, per ton.....	\$11 00	\$9 20 to \$13	\$12 to \$14 50
Steel rails at mills, per ton.....	\$21 00	\$22 25	\$21 00
Wheat, No. 2 red winter, per bushel.....	64	60 1/2	60 1/2
Corn, Western mixed No. 2, per bushel.....	43	5 1/2	10 1/2
Yield, main, per barrel.....	\$14 to \$14 25	\$12 75 to \$13 25	\$9 75 to \$9 25

being unacceptable to the Administration, and there being little probability that satisfactory legislation could be secured, the President informally opened negotiations with J. P. Morgan & Co. for the purchase of 11,500,000 ounces of gold, deliverable one half promptly and the re-

The Crops.—With the exception of winter wheat and cotton the crops were abundant, and there was an unprecedented yield of corn and oats, estimates of the Department of Agriculture showing a yield of 2,151,138,580 bushels of the former and of 824,443,537 of the latter. Conse-

quently, prices were low, and at the end of December corn was 34½ cents, while oats were 23½ to 23¼ in the New York market. Wheat advanced early in the season on news of the damage to the winter crop, and in June the price here was 83 cents, but later there was a decline, and at the end of the year it was 66½ cents. The cotton crop was late and the yield was short. Planters who had been compelled to sell last year's cotton at what they regarded as ruinously low prices appeared disposed to take advantage of the short crop, and some were encouraged to hold back the staple. In September there was a speculative movement which advanced the price, and in October these speculators made an attempt to corner October deliveries of cotton, and this resulted in an advance to about 9 cents. Then the price gradually fell off, but at the end of the year it was 8½ cents.

Taking prices in New York, Jan. 1, 1896, if the whole of the crops could have been laid down at that point on that date, the values would have been as in the following table:

PRODUCTS.	CROP OF 1894.			CROP OF 1895.		
	Yield.	Price, Jan. 2, 1896.	Value.	Yield.	Price, Jan. 2, 1896.	Value.
Wheat, bushels.....	460,267,416	\$0 60½	\$298,420,473	467,102,947	\$0 60½	\$309,455,702 29
Corn, bushels.....	1,212,770,052	51½	621,608,502	2,151,138,580	84½	742,142,510 18
Cotton, bales.....	9,000,000	5½	255,387,500	6,500,000	8½	272,187,500 00
Total values.....			\$1,170,966,450			\$1,323,786,012 49

Stocks.—The lowest prices for the majority of stocks were recorded during the first quarter of the year, while the highest were in the last six months, though there was an important downward reaction in the industrials in November, and the whole market was more or less affected by selling of railroad stocks for European account in December, due to the panicky fall resulting from the Venezuelan message of President Cleveland. Influenced by the discussion of the Carlisle currency measure in the House of Representatives, by engagements of gold for shipment to Europe, and by the unsettled financial conditions, the stock market was irregular and generally lower in January. There was a fairly large short interest in leading stocks at the beginning of the month, and soon after some manipulation of Chicago Gas and an advance in the Grangers induced general rebuying to cover short contracts, which caused a gradual improvement, and the tone was strong until after the middle of the month, when continued withdrawals of gold for export to Europe and indications of hoarding of the coin by some of the banks in the interior, together with selling of stocks for European account, brought about a decline, and the tendency was downward until just before the close, when reports of an intended issue of bonds by the Government caused a sharp rally, and the tone was strong to the end of the month, with the greatest improvement, compared with the opening, in Sugar, Delaware and Hudson, Illinois Central, Lake Shore, Manhattan, New York Central, Omaha preferred, Pullman, and Rock Island, while the most important declines were in Tobacco, Canada Southern, Consolidated Gas, General Electric, Louisville

and Nashville, Missouri Pacific, Lead, Reading, Rubber, the Cordages, and Wheeling and Lake Erie preferred. The market opened strong in February, influenced by the contract for the sale of 4-per-cent. bonds to the Belmont-Morgan syndicate, and there was a good demand for all the leading stocks, which kept the market quite strong until the second week, when sales to realize profits and some pressure by the bears caused an irregular decline, and the market was generally heavy until a few days before the close, when there was a slight improvement. The weakest stocks, comparing the opening with the closing sales, were Tobacco, Canadian Pacific, the Grangers, Central New Jersey, Chicago Gas, Lake Shore, Louisville and Nashville, Missouri Pacific, Lead, Northern Pacific preferred, the Leathers, Western Union, and the Wheelings, and the only strong stocks were Consolidated Gas and Whisky. Immediately upon the adjournment of Congress, on March 4, there was a decided improvement in the market, led by Sugar and General Electric, and followed

by the Grangers, and the tone was generally strong, with occasional sharp advances in some of the specialties until the third week, when, owing to the elimination of the short interest, prices fell off, but good support at the decline again turned the market upward, and it closed quite strong, with the most decided improvement, compared with the opening, in Sugar, Cotton Oil, Atchison, Tobacco, Central New Jersey, the Delawares, General Electric, Louisville and Nashville, Missouri, Kansas and Texas preferred, Missouri Pacific, Lead, New England, Reading, the South-erns, the Leathers, Union Pacific, the Wheelings, and Western Union. The success of the Belmont-Morgan syndicate in restoring confidence at home and abroad in the financial situation had much to do with an improvement in the market during April, and there was a good demand by Europeans for American stocks and railroad mortgages. There was an irregular fall in Sugar soon after the opening of the month, caused by the closing of some of the refineries, and the Coal shares were broken down by a raid, and the whole market was more or less unfavorably influenced by rumors of an extra session of Congress in case the income-tax law should be declared unconstitutional. But gradually the tone recovered, and after the middle of the month there was good buying of stocks for European and domestic account, and the transactions in railroad mortgages were quite large. The market closed very strong, with the greatest gains, compared with the opening, in Sugar, Tobacco, the Vanderbilt specialties, Consolidated Gas, Whisky, Louisville and Nashville, Missouri, Kansas and Texas preferred, the Grangers, Northern Pacific preferred, and

the Leathers, and the only important losses were in Central New Jersey and General Electric. In the early part of May there was liberal buying of stocks for European account, stimulated by indications of the entire success of the Bond Syndicate in their operations, and the tone was very strong until the third week, when realizing sales caused an irregular decline, and the Grangers were especially influenced by reports of damage to the growing crops, and the movement was somewhat feverish for the remainder of the month. Comparisons with the opening showed gains in Sugar, Atchison, Tobacco, Canadian Pacific, Central New Jersey, Reading, the Grangers, Whisky, Louisville and Nashville, Missouri Pacific, the Vanderbilt specialties, New England, Pacific Mail, the South-west, the Leathers, the Rubbers, the Wabashes, and Western Union. In June the market was irregular and generally lower, influenced by liquidation of speculative accounts, by selling of stocks of bankrupt roads in anticipation of heavy assessments, and by the indifference of European speculators, there then being an active movement at rapidly advancing prices in South African mining shares in London. One feature was a sharp fall in New York, Susquehanna and Western, caused by a rumor that the company was financially embarrassed, and there was a heavy decline in Rubber and in the Corlidge stocks, the latter due to the appointment of a receiver. The tone was fairly strong during the first week, owing to a covering of short contracts induced by an improvement in the crop situation. Then came an irregular fall, and the market was generally heavy after the middle of the month to the close, when the weakest, compared with the opening, were Sugar, Tobacco, Chicago Gas, General Electric, Pacific Mail, and Lead, while the strongest were Missouri, Kansas and Texas preferred, Northern Pacific preferred, the Wheelings and New York, Susquehanna and Western, the latter being influenced by a change in the management. The market was heavy during the greater part of July. Chicago Gas was broken down early in the month by disquieting reports, and at the same time Sugar and Tobacco were strong, but subsequently these stocks were raised, and there was also selling of Leather preferred on the announcement of a new issue of stock. The fall in these specialties more or less affected the whole market until the last week in the month, when there was a general recovery, mainly due to closing of short contracts, and, compared with the opening, the improvements were greatest in Sugar, the Grangers, Cleveland, Chicago, Cincinnati and St. Louis, Illinois Central, Louisville and Nashville, Missouri Pacific, New England, Northern Pacific preferred, Southern preferred, and Wabash preferred, while the declines were heaviest in Chicago Gas and Leather preferred. There was an irregular and a lower market during the greater part of August, influenced by the tension in exchange and by exports of gold to Europe for mercantile and other account which seemed to threaten a new issue of bonds, and the feature was liquidation in the industrials. The Grangers were, however, well supported on the favorable crop prospects. Early in the

month there was free selling of the Leathers, caused by some dissatisfaction in regard to the course pursued by the directors with respect to the dividend, and the general market was affected by rumors that large amounts of securities which had been bought by Europeans would be returned. Later there came rumors, based upon Washington dispatches, of an intended issue of bonds in case the net gold reserve should be materially reduced by withdrawals for shipment to Europe, and this caused free selling of all the active stocks, including Sugar, Tobacco, the Leathers, the Grangers, Chicago Gas, Electric, and the Southwesterns. The short interest grew quite large by the third week of the month, and although then the exports of gold were heavy the market was sharply advanced in consequence of rebuying to cover short contracts induced by the action of the Bond Syndicate in depositing gold with the Sub-Treasury to replace that which had been withdrawn for shipment to Europe, thus obviating the necessity for a bond issue, and the rally was also aided by very encouraging news from the corn belt, which stimulated purchases of the Grangers. The market was generally strong thereafter to the close, though Tobacco was sharply raided on news of the beginning of the contest with the plug-tobacco manufacturers. The most decided gains for the month, compared with the opening, were in Sugar, Atchison, Central New Jersey, Reading, Chicago Gas, Illinois Central, Louisville and Nashville, Missouri Pacific, Minneapolis and St. Louis, the Grangers, Pittsburg, Cincinnati, Chicago and St. Louis, Tennessee Coal and Iron, Union Pacific, Western Union, and Wabash preferred, while the greatest losses were in Tobacco, Erie, Leather preferred, and Wheeling common. In September the market was generally lower, influenced by continued gold exports, and also by the wild speculation in South African mining shares in London and on the Continent which threatened a disastrous collapse. At the same time the movement of Cotton was light, thus contributing to the tension in the exchange market. One feature in the first week was good buying of Reading and the other Coal shares on rumors of a speedy settlement of the coal troubles. There was also an advance in Sugar and a good inquiry for the Grangers encouraged by excellent reports regarding the condition of Corn, and at the same time there was liberal selling of Tobacco. In the second week the large exports of gold more or less affected the whole market until the end of the week, when the syndicate announced that they would continue to protect the Treasury gold reserve. During the third week rebuying to cover short contracts brought about a decided improvement in Sugar, the Grangers, and Missouri Pacific, while Tobacco was feverish and lower. One unfavorable influence in the last week was the engagement of gold for shipment to Germany, but an easier tone for exchange by the close of the week arrested further shipments of the metal, and one feature was a rise in the Coal shares, caused by an advance in the price of anthracite coal, and there was a decided recovery in Tobacco. The most important gains for the month, compared with the opening, were in To-

tobacco, Canadian Pacific, Chicago Gas, the Coal shares, Whisky, and Tennessee Coal and Iron, while the losses were heaviest in Sugar, Cotton Oil, Canada Southern, the Grangers, Cleveland, Cincinnati, Chicago and St. Louis, Illinois Central, Lake Shore, Michigan Central, New York Central, Missouri Pacific, Southern preferred, Union Pacific, the Leathers, Wabash preferred, and Western Union. The market was generally lower in October, influenced by almost constant fears of an unsettling collapse in the mining share speculation in London and Paris; by the firm tone for exchange, mainly caused by an attempt to corner October deliveries of Cotton; by liquidation of long accounts; and by bearish pressure, particularly upon the industrials. There was a sharp attack upon Leather and Tobacco during the first week, and at the same time good buying of Sugar, Chicago Gas, the Coal shares, and the Grangers. Early in the second week a very firm tone for exchange had a disturbing effect, but later the market rallied on a decline in sterling, due to more liberal offerings of Cotton bills. In the third week exchange again grew strong, and then there was liberal selling of Tennessee Coal and Iron, Missouri Pacific, Sugar, Tobacco, the Leathers, Manhattan, the Coal shares, and the Grangers. In the last week the political tension in Europe and disturbing declines in South African mining shares in London and Paris had more or less of an unsettling effect upon our market, and one feature was a fall in Reading, caused by a report that an assessment of 20 per cent. had been decided upon. The weakest properties, comparing closing with opening prices, were Reading, Tennessee Coal and Iron, the Grangers, Sugar, Tobacco, Chicago Gas, the Leathers, Cleveland, Cincinnati, Chicago and St. Louis, Denver preferred, General Electric, Hocking Valley, Illinois Central, Louisville and Nashville, Manhattan, Missouri Pacific, Northern Pacific preferred, Missouri, Kansas and Texas preferred, Pittsburg, Cincinnati, Chicago and St. Louis preferred, Southern preferred, Wabash preferred, and Wheeling common. The political tension in Europe, arising out of the vigorous protests of the six powers against the failure of the Sultan of Turkey to protect the Armenians, and the collapse of the speculation in South African mining shares in London and on the Continent, involving enormous losses, were the chief disturbing factors during November, though the firm tone for exchange and the resumption of gold exports had an important influence. The closing of some of the Sugar refineries affected Sugar, and the restriction of work at tanneries unsettled the Leather stocks, while the decision of the Attorney-General of New York to proceed against the Tobacco trust caused a sharp decline in that property. There was more or less selling of the Grangers, Reading, and of Louisville and Nashville for European account, and Manhattan was broken down by decreased earnings, while Western Union was unfavorably influenced by a decision of the United States Supreme Court, which deprived the company of the privilege of contracting with subsidized roads. After the middle of the month comparatively large gold exports contributed to the decline in the market. In the last week there

was an irregular recovery, due to rebuying to close short contracts, induced by a relaxation in the political tension in Europe, and also to indications that the liquidation in South African mining shares in London was at an end. The most important losses for the month, compared with the opening, were in Tobacco, Chicago Gas, Delaware and Hudson, Whisky, Hocking Valley, Louisville and Nashville, Manhattan, Missouri, Kansas and Texas preferred, Reading, Southern preferred, Tennessee Coal and Iron, Union Pacific, the Leathers, and Western Union. The market was irregular in December with the largest trading in the Industrials, Sugar advancing, followed by Chicago Gas, while Tobacco sharply declined on news of the passing of the dividend, but later this stock advanced, and one feature in the second week was a rise in Consolidated Gas and in Leather preferred, while Reading was weak on the announcement that the plan for reorganization had been agreed upon. The tone was heavy in the early part of the third week, with pressure upon the Industrials, Chicago Gas, Reading, the Grangers, and Missouri Pacific as the feature. The irritation in England caused by the President's reference to the Monroe Doctrine in his special message to Congress caused a sharp decline in American stocks in London on Wednesday, and this was reflected in our market. The action of Congress in sustaining the President seemed to increase the irritation on the following day, and on Friday and Saturday there was a panicky fall in the market, and compared with the opening of the week prices at the close showed declines of 11 per cent. in Sugar, 15½ in Central New Jersey, 21 in Consolidated Gas, from 8½ to 15½ in the Grangers, and from 4 to 11 per cent. in other stocks. There was a much better feeling in London in the following week, based upon evidence of the determination of Congress to support the President, and also upon the conviction that there would be no serious trouble between the two countries arising out of the Venezuelan controversy, and rebuying to cover short contracts caused a recovery there, while our market was favorably influenced by the action of the Bank Clearing House Committee in deciding to issue loan certificates if necessary, and by evidence that Congress would speedily act for the relief of the Treasury. The market was very strong until toward the end of the month, when the strained financial situation, the opposition of the Interstate Commerce Commission to the trunk-line agreement, renewed selling by the arbitrage houses, local liquidation, active money, and indications of the failure of the Senate promptly to act upon the bond bill, which had passed the House, caused an irregular decline, though the undertone was better at the close of the month, influenced by reports that a bond issue for \$100,000,000 had been decided upon by the Administration, and that a syndicate had been formed to negotiate the loan. The largest losses for the month, compared with the opening prices, were in Sugar preferred, Cotton Oil, Tobacco, Atchison, the Vanderbilt specialties, the Coal shares, the Grangers, Denver and Rio Grande, Whisky, Electric, Louisville and Nashville, Illinois Central, Missouri, Kansas and Texas, Missouri Pacific, Lead, New England, Pacific Mail, Pullman, the

Southern, Union Pacific, the Rubbers, Western Union, the Wheelings, and Tennessee Coal and Iron. The only important gains were in Sugar common, Chicago Gas, and Manhattan.

Total sales of stocks at the New York Stock Exchange for 1895 were 66,583,232 shares, against 49,975,032 in 1894; 80,977,839 in 1893; 85,875,082 in 1892; 69,031,689 in 1891; 71,282,885 in 1890; and 72,014,600 in 1889.

The following table shows prices of leading stocks at the beginning of the years 1894, 1895, and 1896:

STOCKS.	1894.	1895.	1896.
New York Central.....	98½	98	97
Ill.	144	10	144
Leg. St.	120	154½	141½
Madison Central.....	90½	98	92
Rock Island.....	60	61½	67½
St. Paul, common.....	98½	97½	100
St. Paul, preferred.....	56½	55½	60½
Pa. L. & W. and Western.....	141½	160½	160
Central New Jersey.....	112	89½	100½

The following shows the highest prices of a few of the speculative stocks in 1894, and the highest and lowest in 1895:

STOCKS.	1894.	1895.	
	Highest.	Highest.	Lowest.
American Sugar Refining Co....	114½	121½	89½
Am. Tobacco and Sante Fé...	16	2½	1½
Central New Jersey.....	117½	116½	81½
Chicago, Burlington and Quincy.....	84½	99½	60
Chicago Gas.....	80	78½	49½
Delaware and Hudson.....	144½	134½	115
Pa. L. & W. and Western.....	174	174	154
Producers and C. F. Co.....	204	254	8
Rock Island.....	18	158	7½
St. Paul.....	139	158½	134½
St. Paul and Nashville.....	57	66½	29
Manhattan Elevated Canal.....	127½	119½	95
Missouri Pacific.....	59½	42½	154
New York Central.....	102½	104½	90
New York and New England.....	55½	65½	29

Foreign Exchange.—The imports of merchandise for the year ending Dec. 31, 1895, were \$135,613,097 above those for 1894, and the exports of domestic and foreign merchandise were \$295,726 less. The excess of merchandise exports over imports for the year was \$3,269,884, against \$148,789,307 for 1894. The excess of exports over imports of merchandise, coin, and bullion for 1895 was \$137,895,457, against \$267,221,937 in 1894. Gold exports were \$72,065,687 in excess of the imports in 1895, against \$81,212,593 in 1894.

The foreign exchange market was in an abnormal condition during the greater part of the year, being influenced soon after the beginning of the Bond Syndicate operations in February by manipulation having for its object, at first, the sale of bills at high prices, to be covered later by

drafts drawn against securities bought for European account; and next, by sales at still higher prices which it was expected could be covered with cotton or grain bills. Though during three out of the five months ending with June embraced by the Bond Syndicate operations rates for exchange were at or above the normal gold-exporting point, no gold was shipped, and from the end of January to the middle of July not a dollar of gold was sent abroad, and not until the end of August was any gold shipment made by a banking house of any prominence, all of the foreign bankers loyally co-operating with the Bond Syndicate in their efforts to maintain confidence in the financial situation. After the Bond Syndicate contract was fulfilled at the end of June these bankers for some time sought to reimburse the Treasury for the loss of gold caused by shipments for profit, first transferring the metal from their reserve fund, then procuring domestic gold from the smelters, and finally by inducing some of the banks to deposit gold with the Treasury in exchange for legal-tender notes. The gold shipments which began in July ceased on Sept. 28, but they were resumed in November and continued to the end of the year, and they were large in December by reason of the strained political and financial situation, but the volume was somewhat restricted by dearer rates for money.

The nominal rates for exchange at the opening in January were \$4.88½ for sixty-day and \$4.89½ for sight. Bills were scarce and the demand for remittance was so great by reason of the unsettled currency conditions then prevailing that \$4,550,000 gold was shipped to Europe on the 5th, followed by \$3,100,000 on the 12th, by which time nominal rates had been advanced to \$4.89 for sixty-day and \$4.90 for sight. On the 16th \$850,000 gold was exported, on the 19th \$4,400,000, on the 23d \$500,000, and on the 26th \$6,550,000. On the 28th the Bank of England reduced the price of American gold coin to 76s. 3½d. per ounce, but such was the urgency of the demand to remit the metal that nominal rates for exchange were advanced to \$4.89½ for sixty-day and \$4.90½ for sight, and on the 29th \$3,562,000, and on the 30th \$2,406,000 gold were exported, making a total for the month of \$23,912,000. Some assurances of negotiations for a new issue of bonds caused a fall of half a cent in nominal rates on the morning of the 31st, but there was a recovery in the afternoon, and the market closed firm at \$4.89 to \$4.89½ for sixty-day and \$4.90 to \$4.90½ for sight. The market opened strong on Feb. 1 at the closing figures for January, but in the afternoon news that negotiations for a new bond issue had been completed caused a fall to \$4.88 to \$4.89 for sixty-day and \$4.89 to \$4.90 for sight, and engagements for \$4,950,000 gold for export on the following day were canceled and the shipment was confined to \$500,000. The market then became unsettled and lower, nominal rates falling to \$4.87½ for long and \$4.89 for short by the 12th, but about the middle of the month there was a firmer tone by reason of a demand for remittance and rates advanced by the close of the month to \$4.88 to \$4.88½ for sixty-day and \$4.89½ to \$4.90 for sight. On the 20th \$1,250,000

000, and on the 23d \$1,470,000 gold arrived from Europe, being the first importations by the Bond Syndicate under their contract with the Government. In March the market opened at \$4.88 for sixty-day and \$4.89½ to \$4.90 for sight, subsequently advancing to \$4.88½ for the former, and remaining unchanged until the 25th, when \$4.89 was posted for long and \$4.90½ for short. The urgent demand for remittance was met almost wholly with bills drawn by the Bond Syndicate until toward the close, when some bills were drawn for the purpose of loaning the proceeds in the money market, which was then active. The tone for exchange was strong at the end of the month, but though rates for actual business were half a cent higher than they were in January, when gold was being shipped, none of the metal was sent abroad, partly because of the uncertainty regarding the quality of the metal which would be supplied by the Sub-Treasury, but mainly for the reason that the Bond Syndicate were willing to meet the requirements of remitters with bills. In April nominal rates for exchange were practically unaltered at \$4.88½ to \$4.89½ for sixty-day and \$4.90 to \$4.90½ for sight until the end, when the lower rate for long-standing was advanced to \$4.89, and the market closed firm. The Bond Syndicate had entire control, and they continued to supply bills to meet the demand for remittance, drawing against United States bonds and other securities which they placed abroad. The success of the Bond Syndicate, which was pretty fully demonstrated by the end of April, seemed to restore confidence abroad in the American currency situation, and large amounts of securities were sold to Europeans during May, not only by the syndicate, but by other bankers, and consequently the exchange market was liberally supplied with bills. The market opened easy at \$4.88½ to \$4.89 for sixty-day and \$4.90 to \$4.90½ for sight, and by the 14th there was a fall to \$4.86½ to \$4.87½ for the former and \$4.87½ to \$4.88½ for the latter. At these rates the Bond Syndicate began to rebuy the bills which they had sold at high figures, thus absorbing all offerings, and the market gradually grew firmer, rates advancing by the 22d to \$4.88 for sixty-day and \$4.89 for sight, and closing firm at \$4.88 to \$4.88½ for the former and \$4.89 to \$4.89½ for the latter. The market was strong in June, influenced by a demand to remit for stocks sold for European account, which selling was encouraged by the comparatively high prices ruling for some of the properties, but though the bond contract was fulfilled by the end of the month, the syndicate retained control of the market, meeting all demands for remittance with their bills. The nominal rates opened at \$4.88½ for sixty-day and \$4.89½ for sight, promptly advanced to \$4.89 to \$4.89½ for the former and \$4.90 to \$4.90½ for the latter, and they so remained to the close. In July the market was strong, opening at \$4.89 to \$4.89½ for sixty-day and \$4.90 to \$4.90½ for sight, and advancing to \$4.90 for the former and \$4.91 for the latter, which figures were unprecedentedly high, and these rates called for correspondingly high figures for actual business, these being \$4.89 to \$4.89½ for long, \$4.90 to \$4.90½ for short, and \$4.90½ to \$4.90½ for cable transfers.

The Bond Syndicate were prepared to meet with bills all demands for remittance, and none of the bankers made the least attempt to ship gold, but on the 13th \$200,000 of the metal was shipped by a bullion house for profit, and this was followed by \$1,000,000 by a commercial house, and by the close of the month \$1,730,473 had been exported, but the Bond Syndicate reimbursed the Treasury, depositing \$2,000,000 gold on the 27th. The market was generally firm during August, opening at \$4.90 for sixty-day and \$4.91 for sight, and rates for actual business were held at \$4.89½ to \$4.89½ for long, \$4.90½ to \$4.90½ for short, and \$4.90½ to \$4.91 for cable transfers. On the 23d offerings of bills drawn against gold exports caused a decline in nominal rates to \$4.89½ for sixty-day and \$4.90½ for sight, the first reduction since July 20, and the tone grew easier, closing at \$4.89 to \$4.90 for the former and \$4.90 to \$4.91 for the latter. Gold exports for the month were \$15,412,000, and for the purpose of reimbursing the Treasury the syndicate deposited \$8,500,000 gold. In September the market opened at \$4.89 to \$4.90 for sixty-day and \$4.90 to \$4.91 for sight, and the tone became easier after the middle of the month, influenced by offerings of bills against gold exports, and also by some drafts against cotton. The market closed at \$4.88 to \$4.89 for sixty-day and \$4.89 to \$4.89½ for the latter. Shipments of gold amounted to \$16,050,000, of which \$2,500,000 were sent to Germany on order, and \$2,500,000 gold was sent by one of the regular banking houses in consequence of their inability to procure bills, the syndicate having ceased to sell, but during the month they deposited \$2,500,000 with the Treasury, making with deposits not publicly announced \$16,127,432.94. In October the market opened steady at \$4.87 to \$4.88 for sixty-day and \$4.88 to \$4.89 for sight, but by the 9th there was a fall to \$4.87 to \$4.87½ for the former and \$4.88 to \$4.88½ for the latter, caused by fairly liberal offerings of cotton bills and drafts against Anaconda mining stock placed abroad, but these were promptly absorbed, gradually the market grew firmer, and it closed at \$4.88½ for long and \$4.89½ for short. No gold was shipped during the month. The market was strong during November. Rates at the opening were \$4.88½ for sixty-day and \$4.89½ for sight, but by the 6th the latter advanced to \$4.90 in consequence of higher discounts in London, and those rates ruled to the end of the month. On the 12th \$1,000,000 gold was shipped to Europe, and the exports for the month amounted to \$13,704,055, and the Treasury sold gold bars to shippers toward the close at ⅛ of 1 per cent. premium. In December rates opened at \$4.88½ for long and \$4.90 for sight. The sixty-day rate was advanced on the 5th to \$4.89 in consequence of easier discounts in London, and \$500,000 gold was sent to Buenos Ayres on the 4th and \$500,000 more on the 7th, and \$2,600,000 was shipped to Europe on the 7th. The tone grew easier in the second week and only \$1,000,000 was exported to Europe. In the following week the market was strong and \$3,180,000 was sent to Germany on Tuesday. Toward the end of the week the market was somewhat deranged by activity in money, and \$3,100,000 gold was shipped to Europe and \$300,000 to Buenos Ayres. On

the 23d and 24th the fear that legal tenders could not be obtained for exchange for gold required for shipment caused an advance in rates for sterling to \$4.89 for long and \$4.91 for short, and some bankers demanded \$4.92 for cable transfers. There was a shipment of \$1,700,000 gold on the 25th and \$2,000,000 were engaged for export on the 28th; but \$1,500,000 of this was withheld because of the probability that it could be employed to good advantage in connection with the new bond issue, negotiations for which were then pending. The only shipment of gold for the remainder of the year was \$500,000 to Buenos Ayres, making \$1,800,000 since the movement to South America began.

Manufacturing Industries.—The strained financial situation in January and until confidence began to grow in consequence of the operations of the Bond Syndicate, acted as an incubus upon all manufacturing industries. Early in March there was a revival, which was chiefly noticeable in iron. This was followed later on by an improvement in cotton goods, and gradually other industries became active, and one feature was a voluntary advance in wages by manufacturers all over the country, indicating a profitable business and a disposition on the part of employers to encourage their employees. During the summer and early fall the iron trade led in point of activity, and in November the production of pig iron was estimated at 217,306 tons per week. There was also a good demand for steel for railroad and structural purposes, but toward the end of the year the inquiry grew smaller and prices fell off from the highest points. The advance in cotton in October, caused by speculative manipulation of the markets, tended to check manufacturing, especially at the East. The demand for leather, which was quite noticeable in 1894, continued this year and exports were large, not only of hides, but of manufactured goods. The coal trade was more or less unsettled during the year by what appeared to be unreconcilable differences between the Reading receivers and the managers of the other companies regarding an apportionment of the output, and though earnest efforts were made in the direction of harmony, they were unsuccessful. Self-interest, however, induced all managers so to regulate production as to prevent the market from being greatly oversupplied. Increased importations of woolen goods had a depressing effect upon home manufacturers and many were compelled to close, while all sold their goods at exceedingly small profit. The sales of foreign and domestic wool in the leading markets exceeded those of 1892 by 80,000,000 pounds.

Business failures in 1895 numbered 13,197, involving \$173,196,000, against 13,885 in 1894, involving \$172,992,856. There was a decrease in the first quarter of the year, followed by a slight increase in the second and third quarters and a large increase in the last quarter, caused principally by manufacturing failures. In 7 States these suspensions amounted to 62.6 per cent. of the whole, probably due to speculation in materials and overproduction.

Money.—Money on call, representing bankers' balances, loaned at the Stock Exchange at 80 and at $\frac{1}{2}$ of 1 per cent. during the year. A 5-per-

cent. rate was recorded on March 1, there then being some shifting of loans caused by settlements for 4-per-cent. bonds delivered by the syndicate on that day. Toward the end of January loans were made at 3 per cent. in consequence of a temporary derangement of the market resulting from payments for dockage, wharf, and warehouse property, and during July some manipulation of the market by the Bond Syndicate, with the object of influencing exchange, brought about a temporary advance to 3 per cent., and at the same time some of the banks sought to maintain a $\frac{3}{4}$ -per-cent. rate. In October, while the bank reserves were low by reason of withdrawals of currency for crop purposes, 3 per cent. was again recorded for a few days, but later the rate fell to $\frac{1}{4}$. During the semipanic on Dec. 20 and 21 loans were made at 80 per cent., but on Dec. 23 the Bank Clearing House decided to issue loan certificates, and the rate fell to 3 per cent. After the disbursements of January interest the market for call loans became congested, and it was difficult to place money at 1 per cent. until toward the close, when the market was partially unsettled by the payments for the warehouse property above noted, and also by the strained condition of the Treasury resulting from withdrawals of gold for export, and the market was active at $\frac{1}{4}$ to 3 per cent. for the remainder of the month. At the same time there was a good demand for loans for fixed periods with an insufficient supply, and the rates were advanced to 2 per cent. for thirty days, 3 for sixty days, $\frac{3}{4}$ for ninety days, and 4 for five to six months. There was also an advance in commercial paper to 4 per cent. for short indorsements, and to 4 to 5 for the best four to six months' single names. In February call loans ranged from 1 to 2 per cent., falling to the first-named rate after the 11th, and little was done in time contracts, but commercial paper was in good request at $\frac{3}{4}$ to $\frac{3}{8}$ per cent. for indorsement, and $\frac{4}{4}$ to $\frac{3}{4}$ for four to six months' single names. In March money on call was fairly active, ranging from 5 to $\frac{1}{4}$ per cent.; time loans were 3 to 4 for sixty to ninety days, and $\frac{4}{4}$ to 5 for four to six months, while commercial paper was in good supply with a small demand at $\frac{3}{4}$ to 4 per cent. for sixty-to-ninety-day bills receivable, and $\frac{4}{4}$ to $\frac{3}{4}$ for four to six months' prime single names. Early in April, money on call was active at $\frac{1}{4}$ to 3 per cent., but it soon grew easier, and the rate fell to 1. There was only a light inquiry for time contracts, but the demand for commercial paper was urgent, and rates were $\frac{3}{4}$ to $\frac{3}{8}$ per cent. for indorsements, and 4 to 5 for four to six months' single names. Money on call was in abundant supply in May, influenced by the distribution by the Bond Syndicate of 40 per cent. of their reserve fund, and $\frac{1}{2}$ of 1 per cent. was recorded late in the month. Quotations for time contracts were $\frac{1}{4}$ to 2 per cent. for thirty to sixty days, and $\frac{3}{4}$ to 3 for five to six months, while commercial paper was as low as $\frac{3}{4}$ to 3 per cent. for short indorsements, and $\frac{3}{4}$ to $\frac{4}{4}$ for four to six months' single names. During June, July, and August the market for call loans, time money, and commercial paper was practically unchanged, and loans on call were as low as $\frac{1}{4}$ of 1 per cent. In September call loans were more

active, ranging from 1 to 3 per cent., averaging $1\frac{1}{2}$ after the middle of the month in consequence of the movement of currency to the interior. Time contracts were not in urgent request, and rates were 2 per cent. for thirty days, $2\frac{1}{2}$ to 3 for sixty to ninety days, $3\frac{1}{2}$ for four, and $3\frac{1}{2}$ to 4 for five to six months. Commercial paper was in good supply with a light demand, and rates were $4\frac{1}{2}$ to $4\frac{1}{2}$ per cent. for short indorsements, and $4\frac{1}{2}$ to $5\frac{1}{2}$ for four to six months' single names. Low bank reserves had some influence upon money on call in October, and the range was from 3 to 12 per cent. There were liberal offerings of money for fixed periods at 2 per cent. for thirty days, $2\frac{1}{2}$ to 3 for sixty to ninety days, and 3 to 4 for four to eight months. Commercial paper was of slow sale at $4\frac{1}{2}$ per cent. for indorsements, and $4\frac{1}{2}$ to $5\frac{1}{2}$ for four to six months' single names. Money on call was in abundant supply in November, loaning freely at $1\frac{1}{2}$ to $2\frac{1}{2}$ per cent., and there was no material change either in time contracts or in commercial paper compared with the previous month. In December, until the end of the third week call loans were 1 to 3 per cent., while time contracts were quoted at $2\frac{1}{2}$ per cent. for thirty days, 3 for sixty to ninety days, $3\frac{1}{2}$ for four to five, and 4 to $4\frac{1}{2}$ for six to seven months. Commercial paper was 4 to $4\frac{1}{2}$ for indorsements, and $4\frac{1}{2}$ to $5\frac{1}{2}$ for four to six months' single names. During the semipanic above referred to money on call loaned at 80 per cent.; but in the following week confidence was restored by the prompt action of the Bank Clearing House in deciding to resort to loan certificates, and rates fell off to 3 per cent., but the market was more or less active to the end of the year, and time loans and commercial paper were nominally 6 per cent. for all dates.

The bank loans at the beginning of January were \$493,390,000. There was a reduction to \$480,438,300 by April 6, and a gradual increase to \$522,698,900, the highest, by Sept. 14. Thereafter there was a decrease to \$478,466,500, the lowest of the year, by Dec. 28. Specie reached the maximum, \$82,263,900, Feb. 9. There was a fall to \$64,471,200 April 6, due to payments for the 4-per-cent. bonds, followed by a rise to \$70,783,800 June 8, but after this there was a gradual fall to \$60,861,900, the lowest of the year, Oct. 12, followed by a recovery. The legal tenders rose to \$108,085,500 by Jan. 19, but, influenced by withdrawals by the Bond Syndicate, they fell to \$73,894,600, the lowest of the year, by March 30. Thereafter there was a gradual rise to \$119,883,500, the highest of the year, by Aug. 17, followed by a decrease to \$74,097,800 Dec. 28, reflecting the movement to the interior, and withdrawals for gold exported. Deposits fell from \$559,512,600 Jan. 26 to \$500,822,300, the lowest of the year, April 6. Then came a rise to the highest point, \$577,223,300, on Aug. 17 followed by a fall to \$501,089,300, Dec. 28. The surplus reserve was at the highest of the year, \$45,880,450, Jan. 26, and at the lowest, \$13,413,450, March 30. Then came a rise to \$41,996,575 July 27, and a fall to \$14,176,900 Oct. 12, due to the movement of currency to the interior. There was a gradual advance thereafter to near the close of the year, when there came a decline to \$15,939,675 by Dec. 28.

The condition of the New York Clearing House banks, the rates of interest, exchange, and silver, and the prices of United States bonds, on Jan. 4, 1896, compared with the same items for the preceding two years, are as follows:

ITEMS.	1894.	1895.	1896.
NEW YORK CITY BANKS:			
Loans and discounts.....	\$418,807,600	\$493,890,000	\$465,580,700

The following is the New York Clearing House statement of totals at the beginning of each quarter of 1895 and at the end of the year:

DATE.	Loans.	Specie.	Circulation.	Deposits.	Legal tenders.
January 3.....	\$493,390,000	\$75,867,000	\$11,405,100	\$552,547,800	\$98,267,000
April 6.....	480,438,300	64,471,200	13,054,000	500,822,300	74,664,800
July 6.....	513,604,700	64,496,500	13,184,000	569,873,200	110,145,500
October 28.....	510,202,200	60,987,500	14,253,600	540,069,500	90,558,500
December 28.....	478,466,500	67,114,200	13,926,700	501,089,300	74,097,800

Railroads.—Among the important events affecting railroad interests were the abandonment in January of the Earle-Olcott plan for the reorganization of the Reading; the Norfolk and Western was placed in the hands of receivers, and the Western New York and Pennsylvania was sold under foreclosure in February; a receiver was appointed for the Long Island Traction Company in March; the Mobile and Birmingham, the Georgia Southern and Florida, and the Toledo, Ann Arbor and North Michigan were sold under foreclosure in April; the Atchison reorganization scheme was declared effective and the Columbus, Sandusky and Hocking was placed in the hands of a receiver in June; the New York and New England was sold under foreclosure in July, and later it passed under the control of the New York, New Haven and Hartford; in September there was a conflict of authority between United States circuit court judges in the State of Washington and those sit-

indications that the Bond Syndicate would be successful in their negotiation and in restoring confidence in the currency contributed materially to an increase in railroad earnings, and trade revival was further stimulated by the expenditures by some of the companies, notably the Vanderbilt and the Pennsylvania systems, for improvements and betterments. In the spring-wheat sections the roads made important gains, while in the Southwest the Texas and Pacific and the Missouri, Kansas and Texas sustained heavy losses in the fall on account of the short crop of cotton. Taken as a whole, the railroad earnings were better in 1895 than in the previous year. Except in a few instances there were no labor troubles, and the severe punishment of President Debs, of the American Railway Union, who was imprisoned for several months for contempt of court, seemed to have a salutary effect. The following shows gross and net earnings of the principal trunk lines:

ROADS.	1889-'90.	1890-'91.	1891-'92.	1892-'93.	1893-'94.	1894-'95.
PENNSYLVANIA:

ing in Wisconsin regarding the Northern Pacific road, and this resulted in the resignation of receivers Onkes, Payne, and Rouse, and the differences were not settled at the end of the year. The proposed issue of \$10,000,000 new stock by the Illinois Central was announced. The Central of Georgia, the Savannah and Western, the Columbus, Sandusky and Hocking, the Paducah, Tennessee and Alabama, and the Tennessee Midland were sold under foreclosure in October. The new trunk-line agreement was finally adopted in November, but later it was claimed that it was in violation of the interstate law and legal proceedings were threatened. The United States Supreme Court decided that the Union Pacific had no right to give exclusive privileges to the Western Union to maintain telegraph lines along its right of way. The Marietta and North Georgia, the Mobile and Girard, and the Port Royal and Western Carolina were sold under foreclosure. In December the Chicago and Northwestern, which reduced the dividend on the common stock to $1\frac{1}{4}$ per cent. for July, announced a dividend for January of $2\frac{1}{2}$ per cent. The Denver and Rio Grande declared a dividend on the preferred stock, the first since 1883, and the plan for a reorganization of the Reading was announced. The Atchison, Topeka and Santa Fé, the Montgomery and Eufaula, the Deer Creek and Susquehanna, and the Long Island Traction were sold under foreclosure. Toward the end of the year there were rumors that the Baltimore and Ohio was seriously embarrassed, but the stories were positively denied.

The revival in trade which followed the early

FINE ARTS IN 1895. Under this title are treated the principal art events of the year ending with December, 1895, including especially the great exhibitions in Europe and the United States, sales and acquisitions of works of art, and erection of public statues and monuments.

Paris: Salon of the Champs Élysées.—The exhibition of the Société des Artistes Français, in the Palais de l'Industrie (May 1 to June 30), comprised 4,565 numbers, classified as follows: Paintings, 1,602; cartoons, water colors, pastels, miniatures, enamels, porcelain pictures, etc., 1,121; sculptures, 765; engraving on metals and precious stones, 60; decorative art, 115; architecture, 244; engraving and lithography, 968.

The following are the honorary awards for 1895: Section of painting: Medal of honor, Ernest Hébert. No first-class medal awarded. Second-class medals: Joaquin Sorolla y Bastida, Léon Gustave Ravanne, Paul Lacoste, Lucien Simonnet, Ernest Joseph Laurent, Abel Boyé, René Louis Crétien, Adrien Henri Tanoux, Daniel Sautès, Albert Charles Wallet, Mario Carl Rosa, Eugène Claude. Third-class medals: Henri Bonis, Elizabeth Sonrel, Hubert Denis Etcheverry, Louis Alexandre Bouché, Jean Alfred Mariotot, Emile Troner, Gabriel Emile Edouard Nicolet, Madeleine Smith, Eugène Louis Chavillery, Auguste Prevot-Valeri, Victor Laydet, Henri Biva, Eugène Lomont, Pierre Jacques Dierckx, Mlle. Georges Achille-Foult, Jules Adler, Paul Alphonse Marsac, Victoria Dubourg, Marie Geneviève Duhem, Niels Møller Lund, William L. Picknell, William E. Lockhart, Thomas Cooper Gotch, Edouard Cré-

mieux, René Lelong, Edgard Maxence, Paul Chabas, Paul Liot, Jean Constant Pape, Gaston Charpentier Bosio, Achille Granchi-Taylor.

Section of sculpture: Medal of honor, Frédéric Auguste Bartholdi. First-class medal: Henri Désiré Gauquié. Second-class medals: Paul Lotureau Rousseau, Ernest Dagonet, Georges Marie Valentin Bareaux, Alphonse Moncel, Louis Auguste Théodore Rivière. Third-class medals: Ernest Légrand, Fernand Hamar, Jules Jean Pendaries, Jean Baptiste Belloc, Paul Chevré, Charles Jean Desvergnès, Léon Bardielle, Raoul de Gontant-Biron, Paul Mélin, Charles Louis Virion, Laurent Leclaire, Jean Marie Magrou.

Section of architecture: No medal of honor and no first-class medal awarded. Second-class medals: Emmanuel Pontremoli, Albert Charles Tissandier, Louis Charles Marie Varcollier, Clément Marie Frédéric Josso, Pierre Anne Duménil, Ernest Boué in collaboration with Gabriel Héraud. Third-class medals: Laurent Farge, Guillaume Tronchet, Joseph Charles Marcel Berger, Théophile Leclerc, Félix Eugène Louis Boutron in collaboration with Xavier François Schoelkopf, Eugène Émile Esnault-Pelterie.

Section of engraving and lithography: Medal of honor, Charles Baude. First-class medals: Achille Gilbert (lithography), Jean Patricio (burin). Second-class medals: Claude Faivre (etching), Abel Mignon (burin), Leopold Desbrosses (etching), Tiburce de Mare (burin). Third-class medals: Gustave Théophile Caillaux (lithography), Paul Victor Avril (etching), Émile Crosby (wood), Marie Edmond Honer (lithography), Frédéric Émile Jeannin (etching), Edmond Duplessis (wood), Ernest Juillerat (lithography), Alfred Boilot (etching), Henry Wolf (wood), Agriol Charles Bénard (lithography).

Ernest Hébert, to whom was awarded the medal of honor of the year, exhibited "Le Sommeil de l'Enfant Jésus," a Madonna of the sentimental type shown in his "La Malaria," which originally brought him into notice.

Henri Jean Martin, his closest competitor, to whom the younger artists wished to award the medal, exhibited a large decorative frieze intended for the Hôtel de Ville, representing a painter, a musician, and a poet dreaming in a wood of pines and oranges, and listening to the music in the branches, while angels with large wings fly down to visit them. This picture, of a theme by no means new, possesses technical merits which give it great interest.

Jean Paul Laurens sent a colossal upright panel painted in distemper, intended for the Capitol of Toulouse, entitled "La Muraille, Siège de Toulouse (1218)," representing a local episode from the crusade against the Albigenses. Smiths, carpenters, masons, and other handicraftsmen, aided by men and women—indeed, by the whole population—labor earnestly to complete the wall, the defense which will check the northern invaders, typified by armed figures in the sky. In the distance stretches the great plain, crowned at the horizon by the Pyrenees.

Henri Leroux's "Tirage au sort d'une nouvelle Vestale" represents an sort of the vestal virgins seated on the left, and the candidates standing on the right, while the high priest, standing on a platform in front of the chief vestal, draws a lot from an urn on a tripod.

Jules Bréton exhibited a characteristic picture entitled "Les dernières Glanes," representing peasant women and girls bringing home the last sheaves of the harvest.

Munkacsy's "Avant la Grève" is a realistic picture of an excited assembly of workmen listening to the impassioned words of a speaker who is evidently urging a strike. Edouard Dédaille sent a large canvas representing the Prince of Wales and the Duke of Connaught, and Armand Dumasque a battle scene with the Pyramids for a background, entitled "Bonaparte à la Bataille des Pyramides."

Among the noticeable nudes were "Triomphe de Vénus," by L. Royer; "Psyche et l'Amour," by Bouguereau; "Jeunesse," by P. F. Lamy; "Danse du Soir," by W. L. Dodge; and "Femme Conchée," by G. Popelin.

Many of the principal sculptures of the year are devoted to the augmentation of the iconography of Joan of Arc. Antonin Mercié's contribution, intended for the national monument at Domrémy, represents the maid at the beginning of her mission, when about to leave her native village. France, personified by a female figure, with her regal mantle falling from her shoulders and her armor broken, supports herself by resting one hand on the peasant girl, while pointing with the other to the distress of the kingdom. Joan, seizing with her right hand the delivering sword and raising her face heavenward, as if to invoke the aid of the Supreme Being, waves with her left a farewell to all she is about to leave.

Paul Dubois, whose equestrian statue of the maid is intended for the precinct of the Cathedral of Rheims, represents her mounted, holding in her uplifted hand a long sword. Her head and eyes are raised to heaven in a sort of trance, while she urges on her horse, which advances rapidly with mane erect and tail horizontal. This statue, which is finished with minute care, has occupied the sculptor for fourteen years.

Other statues of Joan are by M. Lanson (representing her wounded in a battle near Orleans) and by M. Allouard.

M. Bartholdi exhibited a colossal marble group, to be erected at Bâle, entitled "La Suisse secourant les douleurs de Strasbourg pendant le Siège de 1870," and M. Fremiet a large bas-relief showing a struggle between orang-outangs and a Borneo savage, in which the latter is vanquished, intended for the new Museum of Natural History in Paris.

The thousand-franc prize of the Société des Artistes Français for 1895 was awarded to François Monthonlon, who has no hands, but paints with the aid of a wooden hand. In 1889 he received honorable mention, and in 1894 a third-class medal.

Paris: Salon of the Champ de Mars.—The sixth annual exhibition of the Société Nationale des Beaux Arts (May 10 to July 10) comprised 2,399 numbers, of which 1,274 were paintings, 481 designs, drawings, etc., 190 engravings, 144 sculptures, 64 art objects, and 45 architecture.

Puis de Chavannes exhibited the great panel painted for the staircase of the Boston Public Library, which is now in place, "Les Muses inspiratrices acclament le Génie, Messager de Lumière." Above a sea of deep blue, under a golden

sky turning to green, advances the genius bearing light. From the top of a cliff, where the grass is verdant, the Muses, wearing long veils, fly down to meet him, bearing the golden lyre, the cithara, or the symbolic branch.

M. Lhermitte's great panel intended for the Hôtel de Ville, representing "Les Halles," is a realistic rather than a decorative work, showing the markets as they are, with their crowd of fish-women, hucksters, etc.

A large canvas by M. Roll, also for the Hôtel de Ville, represents "Les Joies de la Vie: Femmes, Fleurs, Musique." In a decorative landscape nude women are grouped amid flowers and foliage, listening to the music of viols and other instruments.

Noteworthy among the historical paintings was a large canvas by Eugène Burnand, entitled "La Fuite de Charles le Téméraire après la Bataille de Morat." The panic-stricken flight of the fugitives, including heavy Burgundian horses and ironclad knights through somber pine forests makes a graphic picture.

The best piece of sculpture was "Le Projet d'un Monument aux Morts," by Albert Bartholomé, who has been known heretofore only by small separate works. It represents a large rectangular front, with an entrance recalling Egyptian architecture, within which are seen the backs of two figures, a man and a woman, the latter with one hand on her companion's shoulder, walking with faltering steps into eternity. On each side of the entrance, grouped in various postures, are men, women, and children, shrouded, on their way to the tomb. Beneath, in a kind of basement, is a funeral vault in which repose with clasped hands a man and a woman along with their child, and with a figure with outstretched arms kneeling beside them. It is said to be one of the most effective and affecting things in modern sculpture.

American painters were represented this year in the Salon of the Champ de Mars by Alexander Harrison, John W. Alexander, William T. Dana, R. Wilton Lockwood, Bryson Burroughs, Edward E. Ertz, Fanger Irving Conso, Albert P. Lucas, Frank Holman, Lucy Lee Robbins, Carl Wetters, Julius Rohlschoven, Albert Herter, Adèle Herter, Louis Tiffany, John La Farge, and Sarah Whitman.

Paris: Miscellaneous.—Among the acquisitions of pictures at the Luxembourg during the year are "La Forge" of Cormon, "Le Débarquement" of Tattetgrain, "Le vieux Conquérant" of Agache, and "Le Retour du Bal" of Alfred Stevens; and of sculptures, "La Seine" of Puché, "Loin du Monde" of Allonard, "Ultimus felix (Salammbô)" of Rivière, and "La petite Fille pleurant" of Bartholomé. Detaille's "Les Victimes du Devoir," a large canvas exhibited at the Salon of 1894, has been bought by the Government.

A statue of Meissonier, the work of Antonin Mercé, was unveiled in the Jardin de l'Infante, in the Louvre, on Oct. 25. The statue, which is in white marble, on a simple pedestal inscribed "Meissonier," represents the artist, as he was often seen by his friends, clad in a flowing robe de chambre, seated in his chair, palette in hand, as if judging of the effect of a picture. The work is excellent, both as a portrait and as art.

At the sale of pictures belonging to M. Édouard Kann, in May, "L'Île enchantée," by Watteau, brought 41,000 francs; "La Conversation," by the same, 10,000 fr. A portrait of Louis XV, by Boucher, was sold for 13,800 fr.; "Le Calaire," by David Teniers the younger, 4,500 fr.; and "Sapho," by Gustave Moreau, 4,700 fr.

The collection of Madame Lyte Stephens, consisting of pictures, art objects, porcelain, etc., was sold in May. Among the best prices obtained for paintings were: Velasquez, "Portrait of Philip IV," 10,150 francs (Salamanca sale, 1867, 71,000 fr.); "Young Infanta" (Duc de Morny sale, 1867), 111,800 fr.; "Infanta Maria Theresa," 20,000 fr.; Murillo, "Church Triumphant" (Ponrales sale, 1865), 61,100 fr.; Backhuysen, "Marine," 12,000 fr.; A. Cuyp, "Prince of Orange and his Children," 52,000 fr.; Isaac van Ostade, "Village Inn," 43,200 fr.; Rubens and Breughel, "Holy Family," 14,500 fr.; Terburg, "Lady and Cavalier," 50,700 fr.; W. Van de Velde, "Marine," 17,200 fr.; "Marine," 15,100 fr.; Pater, "L'Éscarpolette et la Danse," 40,000 fr.; Claude Lorrain, "Landscape," 12,600 fr.; Vigée-Lebrun, "Portrait of a Woman," 58,500 fr.; Nattier, "Portrait of a Woman," 101,400 fr.

The American Educational Art Institute, which has for its object the establishment and maintenance in Paris of an institution for the culture and promotion of art among American women, was incorporated in June. The purpose is to erect a building near the Arc de Triomphe, to contain a hundred rooms, with lecture and class rooms for the use of women studying art. The charges will be 5 francs per day, including tuition and board. The necessary capital for the institute, which owes its existence largely to the labors of Miss Matilda Smedley, has been raised, and the building is expected to be ready for occupancy early next year.

London: Royal Academy.—The twenty-sixth winter exhibition was devoted as usual to the old masters, especially to those of the English, Flemish, and Dutch schools. The one hundred and twenty-seventh summer exhibition was interesting, being full of attractive works, with not a few ambitious ones.

The president, Sir Frederick Leighton, was represented as usual by several canvases, the most important of which are entitled "Lacrimæ," "Twixt Hope and Fear," and "The Maid with the Golden Hair." The first shows a noble Greek maiden, in a grayish himation over a dark-blue tunic, standing near the marble pedestal of a richly sculptured funeral urn twisted with ivy. She has brought a vase for libations, and a wreath of withered laurel lies at her feet. "Twixt Hope and Fear" is another single figure, a stately Greek lady in saffron robe, seated in a chair covered with gray skins, over the back of which one arm hangs, looking front, her eyes fixed in anxious meditation. "The Maid with the Golden Hair" is a half-length, life-size figure of a beautiful English girl, in a white robe and a blue ribbon, with golden hair flowing over her shoulders. She is absorbed in the perusal of a large book bound in red, which lies open in her lap. "Flaming June," another contribution by the president, is a life-size representation of a Greek damsel in semitransparent tissue of topaz yellow, coiled up asleep upon

a white marble bench under an awning in front of an opening in the wall of a classic chamber. She lies on drapery of pure red, and near her lies a black mantle, the highest note in the chromatic scheme.

Mr. Poynter exhibited an "Ionian Dance," a dancer in semitransparent pale-rose robes performing before richly clad women sitting or reclining upon a marble bench lining the wall of a Romano-Greek hall. The dancer, a lovely rose-crowned brunette, is pirouetting on the tessellated pavement to the music of a girl who leans against a column on the left and plays the double pipes.

Alma-Tadema's single contribution, a long upright canvas entitled "Spring," represents a Roman feast of flowers. A procession is passing down a street between stately buildings in Hadrian's Rome under an intensely blue June sky. The vista, lined by marbles of various colors, is partly closed by a building, from a balcony of which a lady and her attendants watch the scene, while from the roofs and the parapets on each side groups of women and girls are showering flowers on the procession below. It is a marvel of color and detail.

Sir John Millais's "Speak! speak!" his most important contribution, represents a man in high fever who has been tossing on a rude couch with a coverlet of goatskin, dreaming of his betrothed or wife and calling upon her name. Suddenly, to his disordered vision, she answers him in a luminous apparition through the olive curtains at the foot of the couch, which causes him to leap up and cry aloud the words used by Horatio in addressing the ghost of Hamlet's father, that constitute the title of the picture. "A Disciple" is another example of Sir John's power of concentrating interest in a single figure without accessories, so marvelously shown in his earlier pictures, "A Huguenot" and "A Gambler's Wife." It represents a woman clad in an ungirt tunic of deepest black, with both hands lying in her lap, looking up with lofty enthusiasm, apparently listening to the words of some impassioned orator speaking from a rostrum higher than her seat. The scene is evidently in the catacombs of ancient Rome, one of the dark galleries of which opens in the distance. A third picture, "St. Stephen," depicts the body of the murdered saint, its draperies stained with blood, found by pious men and women who are approaching in the gloom of a road on the right.

Mr. George F. Watts's finest work, entitled "Jonah," is a commanding figure of the prophet of woe, nearly full length, slightly clad in a goat skin bound about his waist, with the gourd slung at his side, his brawny arms uplifted to give effect to his angry and vehement denunciations of Nineveh. Other contributions by him were "The Outcast," representing a plump and comely infant seated at the foot of a bank of sand, and a portrait of Max Müller.

Briton Rivière sent but one picture, "Phœbus Apollo," representing the god of day, in blue robe and yellow tresses, standing with outstretched hands in his golden chariot with one foot on the pole, driving a furious team of lions and lionesses over a rocky meadow beside a blue river just lighted by the dawn. His son, H. G.

Rivière, contributed an ambitious subject entitled "Sanctuary," showing the interior of a white marble temple, where, in softened light before a gigantic statue of Juno upon a lofty pedestal, a sorely wounded man has fallen, and a whole family—men, women, and children—claim the protection of the Queen of Heaven.

"On the Sands at Bonlogne" is the title given by Mr. Gow to a well-painted canvas that tells its own story. Napoleon, mounted on Marengo, attended by Soult, Berthier, Bessières, and Murat, and followed by several aids, is riding rapidly along the seashore, gazing with pale, anxious face at the British fleet, half veiled by the sea mist, that renders impracticable his invasion of England.

Stanhope Forbes exhibited "The Smithy," a forceful picture showing the smoky interior of a country farrier's shop, with the farrier shoeing a white horse, while the owner, pipe in mouth, stands at the left awaiting the conclusion of the operation.

London: New Gallery.—The winter exhibition was devoted to pictures of the Venetian and its allied schools, the Paduan, Mantuan, and Brescian, and comprised examples of most of the painters from Jacopo and Gentile Bellini to Pietro Longhi, who died near the close of the last century.

The summer exhibition was one of the best that have yet been opened at this gallery. The chief interest centered in the contributions of Sir Edward Burne-Jones, who sent six pictures. "The Sleeping Beauty" is the completed version of an early design of the fourth of a series exhibited several years ago. The princess is stretched on her couch, and her attendants are fewer than in the later version, while the coloration is less brilliant. "The Fall of Lucifer" depicts the rebel legion, with drooping banners and reversed arms, the lights upon their helmets, shields, and breastplates gradually growing more wan, sinking in a long, wavering line from the golden gate of heaven to the nether abyss. "The Wedding of Psyche," a lovely version of the Olympian bridal, a portrait of Mr. Gladstone's granddaughter Dorothy Drew, a full-length portrait of Lady Winsor, and another portrait, make up his contributions.

Alma-Tadema's "Love's Jeweled Fetter," hung nearly opposite the "Fall of Lucifer," attracted nearly as much attention. Two handsome damsels are seated upon a bronze couch in a sort of marble loggia, from which one looks out on the grayish-blue water of an inlet of the sea, with cliffs beyond and the houses of a town. One of the ladies, a rosy blonde with golden hair, rests her cheek on one hand and resigns the other to her companion, who is sympathetically interested in her betrothal ring, a circlet set with a great ruby. This picture was painted for the Duke of Westminster.

Sir John E. Millais exhibited "Time, the Reaper," clad in black and black-winged, who, armed with a scythe, is pressing forward to open the door of a house lighted from within, and "The Empty Cage," a three-quarters-length figure of a little girl looking sorrowfully at the cage that once held her favorite bird.

London: Miscellaneons.—The fourth Loan Exhibition of pictures at the Guildhall Art

Gallery, opened April 29d, was even more successful than its predecessors. With the exception of a fine Rembrandt, a portrait of his mother, from Earl Spencer's collection, and a few other Dutch pictures, the exhibition was largely made up of pictures of the modern English school, including Sir Frederiek Leighton's "Garden of the Hesperides" and "Nausicaa," Sir John Millais's "Jephthah" and "Rosalind and Celia," Alma-Tadema's "Pyrrhic Dance," Stanhope Forbes's "Forging the Anchor," Mr. Overlandson's "Voltaire," and Mr. Faed's "Silk Attire."

Among the principal art sales of the year at Christie's were the Lyne Stephen's collection of paintings, porcelain, decorative furniture, etc., which brought in the total £141,000, of which the pictures represented £46,786; the James Price collection of 91 pictures, which realized £87,144; the Huth collection, £27,548; and the Ricketts's collection, £20,400. The Viscount Clifden collection of miniatures and objects of art realized about £100,000.

The highest price of the season was paid for Gainsborough's portrait of "Lady Mulgrave," one of the most captivating of this artist's pretty women, which was sold for £10,500, it is said to Mr. Cornelius Vanderbilt. This picture, from the Price collection, was bought at Christie's in 1882 for £1,120 10s., and Mr. Price is said to have refused 7,000 guineas for it in 1890. This is the highest price ever paid for a Gainsborough, the "Duchess of Devonshire," stolen in 1876, having been sold for £10,050. A second portrait of Lady Mulgrave brought £3,675, and "Lady Clarges seated at a Harp," £2,100. His portrait of Madame Le Brun, from the Duchess of Montrose's collection, sold for £2,320; and his landscape entitled "Repose" £1,470.

Sir Joshua Reynolds's portraits of Lady Smyth and her children, from the collection of the Duchess of Montrose, sold for £5,040; and his portraits of Lady Melbourne and the Hon. Mrs. Seymour Damer, from the Price collection, for £2,415 and £2,310 respectively. One of the many portraits of Kitty Fisher brought £1,365, a portrait of "Sylvia," £1,627, and the "Countess of Rothes," \$1,744.

Remney's "Emma, Lady Hamilton," one of the numerous examples, sold for £2,131; "Miss Harriet Shaw," £1,953; "Lady Urith Shaw," £1,890; "Hon. Mrs. Beresford," £1,722; "Lady Beale," £1,102; and "Mrs. Willett," £735. Hoguer's "Lord Nelson" brought £2,677; "Lady Coote," £1,890; "Lady Gordon," \$1,144; "Hon. Maria Pelham Carleton," £1,102; and "Master Russell," £1,050.

Only one great picture by Constable was sold, "The White Horse," of the Huth collection, which brought £8,925. Of Turner's pictures, the superb "St. Mark's Place, Venice," of the Price collection, is said to have passed to an American collector for £10,500. "Mortlake," one of the most luminous and harmonious of the artist's works, fetched £5,460; "Helvoetsluys," which was bought in 1863 for £1,680, brought £6,720; the "Val d'Aosta," price in 1878, £955, brought £4,200; "Going to the Ball" and "Returning from the Ball," £2,940 each; and the "Dream of Italy," £1,312.

Sir W. Beechey's portrait of Frederica Char-

lotte Catherine, Duchess of York, brought £1,260; a "Grand Marine Subject," attributed to Callcott, £2,310; David Cox's "Windsor Great Park," £1,417; Landseer's "Chevy," £5,985; Sir Thomas Lawrence's "Bezestein Bazaar of El Khan Khalil, Cairo," £1,470; John Linnell's "Visit to the Child at Nurse," £1,102; W. J. Müller's "Carnarvon Castle," £2,415; Mulready's "Idle Boys," £1,050; and John Philip's "Early Career of Murillo," £3,590.

A memorial bust of Tennyson, by Woolner, has been placed in Westminster Abbey. It is a replica of the bust without a beard, executed by the same artist in 1857, in Trinity College, Cambridge. A third bust of the poet, representing him as he appeared in 1873, with a beard, also by Woolner, will probably be placed in the National Portrait Gallery. Woolner also made a profile medallion of the Laureate in 1856, and a three-quarters medallion later.

The Burns statue at Ayr, erected in 1891, was completed in August by the placing of a panel representing the parting of the poet and Highland Mary. The three other panels on the base of the monument, put in place during the past four years, illustrate respectively "The Ride of Tam O'Shanter," "The Jolly Beggars," and "The Cotter's Saturday Night." The last panel is the gift of citizens of several of the United States, the money being raised through the exertions of Wallace Bruce, of New York, late United States consul at Edinburgh. The sculptor is George E. Bissell, of New York.

New York: National Academy of Design.

—The Academy held its seventieth annual exhibition in April and May, as usual. The annual prizes were awarded as follows: The Thomas B. Clarke prize for the best American figure composition (\$300), to Henry Oliver Walker's "Morning Vision"; the Norman W. Dodge prize for the best picture painted by a citizen under thirty-five years of age (\$300), to Charles C. Curran's "The Enchanted Shore"; second Julius Hallgarten prize (\$200), to George R. Barse, Jr.'s, "A Tribute to Satyr"; and third Julius Hallgarten prize (\$100) to Francis Day's "Patience."

Among the noteworthy figure pieces in the exhibition were Henry Moder's "The Last Moments," J. G. Brown's "The Gang," Thomas Hovenden's "Jerusalem the Golden," Walter Shirlaw's "Swans," August Franzen's "Evicted," Childé Hassam's "Girl in the White Dory," Thomas Shields Clarke's "Gondola Girl," Carroll Beckwith's "Sleep," Louis P. Demar's "Departure of Fishermen," Annie B. Shepley's "A Wild Rose," Esther Baldwin's "On the Piazza," Kenneth Frazier's "Bretonne en Deuil," and Charles L. Hinton's "Convalescent."

A portrait exhibition at the Academy in November contained a number of canvases interesting to students of art and literature. Among these were a portrait of Shelley at fourteen by Hoppner, John Keats and his two brothers by Severn, Sheridan by Gainsborough, Richard Grant White by John Alden Weir, and two of N. P. Willis by Francis Alexander and Charles Loring Elliott respectively. There were also a few examples of Reynolds and of Remney

and a good Van Dyck, and canvases by Carolus Duran, Bonnat, Sargent, Chartran, and Madrazo.

The autumn exhibition (Dec. 23 to Jan. 11) consisted of 314 works, chiefly paintings. Three fine pictures by the late George Inness occupied the place of honor in the south gallery: "Georgia Pines," "After a Spring Shower at Montclair," and "Sunset."

New York: Society of American Artists.—The seventeenth annual exhibition opened on Monday, April 1. The Shaw Fund prize of \$1,500 was awarded to William M. Chase's "A Friendly Call," and the Webb prize of \$300 to Childre Hissam's "Plaza Centrale and Fort Cabanas, Havana." Noteworthy landscape contributions were "Under the Willows," by Philip Hale; "Morning—Venice," by Henry Mosler; "Naugatuck Valley," by Elizabeth Curtis; "Twachtman's Valley at Sunset," by Robert Reid; "September Sunlight," by Mr. Tarbell; "On the Cliff," by Will S. Robinson; "Pier on Niagara River," by Mr. Twachtman; and "Gloucester Harbor," by George H. Clements. Among the prominent figure pieces were J. Alden Weir's "An Autumn Stroll," Walter Nettleton's "The Cradle," Ernest L. Major's "Flight into Egypt," Kenyon Cox's "Temptation of St. Anthony," Gustave Henry Mosler's "Under the Apple Trees," and William Ernest Chapman's "Orphans." The only large piece of sculpture was Philip Martigny's "Boy."

New York: National Sculpture Society.—The second annual exhibition was held in May in the galleries of the Fine Arts Building, which were decorated with palms and other trees and shrubs to represent an Italian garden, where the statues were set off by a natural background of foliage, or seen amid beds of orchids and other flowers. The Vanderbilt gallery was made into a court with low walls on each side surmounted by plants in pots, with rows of tree ferns leading to an Ionic colonnade at the end, when Mr. Niehaus's statue of "The Scrapper," a nude athlete using the strigil, was seen against a screen of cypresses. In other prominent places in the gallery were J. Q. A. Ward's "Pilgrim" and his seated figures "The Statesman" and "The Warrior," on the Garfield monument at Washington, F. W. Ruckstuhl's decorative group "Mercury teasing the Eagle of Jupiter," and Thomas Shields Clarke's "Sketch for a Monument." Macmonnies's bronze statuette of "A Bacchante" and his "Diana" were displayed in the entrance hall. Olin L. Warner's "Diana," French's group "Gallandet teaching a Deaf-mute Child," and Bissell's "Abraham de Peyster" occupied recesses in the corners.

New York: Metropolitan Museum.—The autumn reopening was marked by the exhibition of a loan collection of early American portraits and other pictures brought together from all parts of the country. Of about 150 early works, a large proportion were by Gilbert Stuart, Copley, Sully, and Washington Allston. By Stuart were portraits of Washington, Jefferson, Adams, Madison, Monroe, and Gen. Gates; by Sully, the portrait of Commodore Decatur and his "Musselora"; and by Allston, his "Deliverance of St. Peter." Trumbull, Pine, Inman, Leutze, and others were well represented.

The Cullum collection of casts of Greek and

Roman sculpture, the gift of the late Major-Gen. George W. Cullum, occupying two galleries on the north side of the Metropolitan Museum, was opened in November. It contains famous statues, casts of the pediments and friezes of the Parthenon, archaic Greek sculptures, etc.

New York: Miscellaneous.—The sixth annual exhibition of the New York Water Color Club, at the galleries of the Fine Arts Society, West Fifty-seventh Street, Nov. 10-23, compared favorably with previous exhibitions. Two hundred and ninety-two works, against 226 shown last year, were displayed in the south and central galleries, the Vanderbilt and east and west galleries being closed. Noticeable pictures were by John La Farge, Charles Warren Eaton, Caroline T. Locke, Arthur T. Kellar, Rhoda Holmes Nicholls, Mathilde de Cordoba, F. K. M. Rehn, Claude Ragnet Hirst, Harry Penn, and Rosina Emmett Sherwood.

The Fine Arts Federation is the title of a new organization, formed at a meeting held at the Fine Arts Building, New York, on Feb. 14, intended to include all the societies interested in the fine arts. Among the societies represented were the National Academy of Design, Society of American Artists, Architectural League, National Sculpture Society, Society of the Beaux-Arts Architects, Municipal Art Society, and the New York Chapter of the American Institute of Architects. Russell Sturgis was elected president.

The Mural Painters is the name chosen by an association of professional artists, whose object is to promote the delineation of the human figure in its relation to architecture, whether rendered in pigment, stained glass, mosaic, tapestry, or other appropriate medium. John La Farge was elected honorary president, and Frederic Crowninshield and George W. Maynard vice-presidents.

The American Art Association held a dissolution sale of its collection of paintings, objects of art, etc., at Chickering Hall, in April. The Van Dyck portrait of the "Marchese di Spinola and her Little Girl" brought the highest price, \$50,000. It was bought for the Paris dealer M. Charles Sedelmeyer. Sir Joshua Reynolds's portrait of Lady Hervey sold for \$6,100, to Mrs. Susan C. Warren, of Boston. Troyon's "The Time of Milking," \$5,050, to H. O'Neil. Monet's "Melting Ice" and "Vue de Rouen" were bought by Henry O. Havemeyer for \$4,250 and \$2,600. Gainsborough's "Mrs. Beech" sold for \$4,150; Sir Thomas Lawrence's "Miss Kent," \$5,000; Rubens's "Portrait of his Father Confessor," \$5,550; Bronzino's "Portrait of Bianca Capella," \$4,100; Corot's "The Pond of Ville d'Avray," \$5,600. One hundred and eighty-five pictures brought in the aggregate \$191,787.

The collection of Gustave Reichard, consisting of 170 pictures, sold on Feb. 21, realized \$264,935.

At the sale of the pictures of the late George Inness, on Feb. 12, 13, and 14, the total amount realized was \$108,670, distributed as follows: First night, \$35,755; second, \$35,385; and third, \$37,530. "The Coming Storm," one of the best pictures in the collection, on which an upset price of \$3,000 was put, remained unsold.

A collection of 20 pictures by the late George Inness belonging to R. H. Halstead was sold

in January at the American Art Galleries for \$31,350.

A picture by Daniel Huntington, commemorative of the laying of the first Atlantic cable, was presented on May 23 to the New York Chamber of Commerce. It represents a meeting of the projectors in Mr. Field's residence in Gramercy Park. Peter Cooper is presiding and Mr. Fuhl is calling attention to a chart of Trinity Bay as a place for the landing of the cable. David Dudley Field, Marshall O. Roberts, Moses Taylor, Wilson G. Hunt, Chandler White, Prof. S. F. B. Morse, and others who took part in the enterprise are also represented.

Amsterdam.—The new Municipal Museum was opened in September with an important collection of modern masters, comprising 617 numbers. In the hall of honor were hung the "Noël" of Emile Breton, two canvases by Neuhay, one by Israëls, one by Mesdag, and one by Thorne Schwartz. In the other halls all the best painters of the modern Dutch and Flemish schools were represented.

Berlin.—The Fine Art Exposition, which opened on May 1 and closed on Sept. 29, was a remarkably successful one. The French Société Nationale des Beaux Arts took part in it and contributed about 150 selected works. Among the artists represented were Puvis de Chavannes, Carolus Duran, Cazin, Gervex, Jean Beraud, Courtois, Bernard, and Ary Renan. Sculptures were sent by Madame Besnard, Cordier, Fix-Mannau, Leduc, and Vallgren. Many prominent American and English painters also took part.

Boston.—Five of the series of paintings by E. A. Abbey for the new Public Library of Boston, which were exhibited in London and in New York at the American Art Galleries in March, are now in place in the Delivery-Room of the library. The subject is the legend of Galahad and the quest of the Holy Grail, and the five scenes depicted are: 1. The angel of the Grail appearing to the infant Galahad and his nurse; 2. The vigil of Galahad; 3, his introduction to the Knights of the Round Table; 4, the institution of the search for the Grail; 5, Galahad in the castle of Amfortas when he sees the vision of the Grail. A portion of John S. Sargent's decorative paintings illustrative of the "Religions of the World" are also in place in the museum hall on the second floor.

Bucharest.—The annual exhibition of paintings, comprising about 300 numbers, was patronized by many prominent painters, especially French, among whom were Cabanel, Carolus Duran, and Henner. Native art was represented by Messrs. Mirra, Verona, Strambulesco, Alexandresco, and Sperlich, who contributed chiefly portraits. The principal landscape painters exhibiting were Messrs. Voinesco and Grigoresco.

Dresden.—The Fine Art Exhibition, comprising 244 paintings, 61 water colors, pastels, and engravings, and 39 sculptures, was opened on Sept. 1. Among the noteworthy pictures were a "Judgment of Paris" by Klinger, a portrait of Bismarck by von Lenbach, portraits and studies by Franz Siebert, P. Kissling, R. Krausse, and G. Lührig, and historical and genre pictures by H. Prell, C. Bautzer, Ad. Menzel, L. von Hofmann, and others.

Florence.—A long-lost picture by Botticelli, painted for Lorenzo dei Medici, entitled "Pallas Athene," has been discovered hung in an obscure corner of one of the royal reception rooms of the Palazzo Pitti, Florence. Mr. William Spence, an English artist, recognized it and communicated his discovery to Prof. Ridolfi, director of the galleries, who had it brought out and verified. A young and beautiful woman representing Pallas, in a floating white dress and mantle, her falling hair crowned with laurel and with a shield at her back, holds a long richly inlaid halberd in her left hand, the end resting on the ground, and grasps with her right hand the hair of a centaur who, though armed with bow and arrows, submits with an expression of despair. According to Vasari, the Pallas represents the wisdom of the Medici subduing disorder and violence, personified by the centaur, and inaugurating peace and prosperity. The picture is supposed to have been painted in 1480.

Munich.—The annual exhibition of the Society of Artists lasted from June 1 to Oct. 31. The medal of honor was awarded to Defregger. The association of Munich artists calling itself "The Secession," which is international, held its third annual exhibition at the same time.

Pittsburg.—The Carnegie Library, the magnificent gift of Andrew Carnegie to the city of Pittsburg, opened with appropriate ceremonies on Nov. 5, is a library, museum, art gallery, and music hall combined. The art galleries, three large connecting rooms, with excellent wall space and light, were opened with a loan collection, chiefly of the modern schools, gathered from all parts of the United States. Among the American artists were John W. Alexander, a native of Pittsburg, who contributed 25 notable pictures, Whistler, Chase, Church, Winslow Homer, Will H. Low, H. Bolton Jones, Edwin A. Abbey, and Ridgway Knight. Foreign painters were represented by Rembrandt, Corot, Bryson, Troyon, Daubigny, Millet, Gérôme, Henner, Dettaille, Mauve, Israëls, Cabanel, Carolus Duran, Knaus, Munkacsy, Landwehr, and many others.

Vienna.—The annual salon, which opened on March 20, comprised 666 numbers. Among the artists who contributed pictures were Gabriel Max, Defregger, W. Firls, who sent a beautiful triptych, L. Dettmann, H. Vogel, E. Klimt (several pictures), and Volkmann, Schönbacher, and Kalbmorgen (landscapes). The sculptors were A. Zöschler, Tolla Certowicz, P. de Vigne, Reinitzer, Kums, St. Sucharda, Franz Seifert, etc.

Washington.—The new Corcoran Art Gallery, at the corner of New York Avenue and Seventeenth Street, is ready for occupation. The building, which has a length of 250 feet on Seventeenth Street, 140 on New York Avenue, and 120 on E Street, is Neo-Grecian in style, of pure white marble on a granite basement. It has twice as much floor and wall space as the old gallery, excellent schoolrooms, and a semicircular lecture hall. The galleries are lighted entirely from the roof. The architect is Ernest Flagg, of New York.

Monuments, etc.—The Society of Colonial Wars celebrated on June 17 the one hundred and fiftieth anniversary of the first capture of Louisbourg by the erection at Cape Breton of a commemorative monument, a column mounted

on a square pedestal bearing the following inscription: "To commemorate the Capture of Louisbourg, A. D. 1745. Erected by the Society of Colonial Wars, A. D. 1895." The shaft is surmounted by a ball inscribed "1745." A medal also was struck in honor of the event, made from the metal of a brass cannon found by divers in the wreck of a French frigate, supposed to be "La Célèbre," sunk in the harbor. It bears on the obverse heads of Sir William Pepperell, the commander of the colonial land forces, and of Sir Peter Warren, the commander of the fleet. The reverse is a reproduction of the medal struck by Louis XV to commemorate the building of the fortress in 1720.

A colossal bronze equestrian statue of Gen. George Gordon Meade, the work of Mr. Henry K. Bush-Brown, of New York, for the Pennsylvania Monument Commission, has been put in place on the Gettysburg battlefield. It is said to be one of the best equestrian statues in the country, and is pronounced by those who knew Gen. Meade to be an excellent likeness. With the pedestal the monument is 25 feet high.

The Brooklyn Memorial Arch, in the Plaza at the entrance of Prospect Park, the corner stone of which was laid Oct. 30, 1889, has been completed by the addition of two life-size equestrian bronze statues in bas-relief, the work of the sculptor William R. O'Donovan and the artist Thomas Eakins, who has been associated with him. Gen. U. S. Grant, on a strongly modeled horse, represented with poised fore leg as if in action, occupies one side of the arch, while President Lincoln, also mounted, with bared head, apparently bowing to the multitude, occupies the other. The pose of both riders is admirable, and the panels give a fitting finish to one of the finest monuments in commemoration of those who fought and fell in the civil war. The arch stands on historic ground, near Lookout Hill, where the Continental troops fought the British regulars in the Revolution.

The Washington Memorial Arch, at the lower entrance of Fifth Avenue, New York, was formally transferred to the city on May 4.

A marble monument, a gift of the Maryland Society of the Sons of the Revolution, in memory of Lord Stirling's Marylanders, who stayed the advance of the English troops Aug. 27, 1776, was unveiled in Prospect Park, Brooklyn, on Aug. 27. The monument, which stands on Lookout Hill, overlooking the scene of the action, is a Corinthian column 39 feet high, surmounted by a bronze cannon ball. It rests on a rough granite foundation and has suitable inscriptions. The designer is Stanford White.

FLORIDA, a Southern State, admitted to the Union March 3, 1845; area, 58,680 square miles; population, according to each decennial census since admission, 87,445 in 1850; 140,424 in 1860; 187,748 in 1870; 269,493 in 1880; and 391,422 in 1890. Capital, Tallahassee.

Government.—The following were the State officers during the year: Governor, Henry L. Mitchell; Secretary of State, John L. Crawford; Comptroller, William D. Bloxham; Treasurer, C. B. Collins; Superintendent of Public Instruction, W. N. Sheats; Commissioner of Agriculture, L. B. Wombwell; Attorney-General, W. B. Lamar; Adjutant General, Patrick Houston;

Chief Justice of the Supreme Court, Benjamin S. Liddon; Associate Justices, R. Fenwick Taylor and Milton H. Mabry; Clerk of the Supreme Court, James B. Whitfield—all Democrats.

Finances.—The total debt, April 1, 1895, was \$1,232,500, comprising outstanding bonds of 1871, due Jan. 1, 1901, \$267,700; outstanding bonds of 1873, due Jan. 1, 1903, \$764,800; and interest-bearing loan, \$200,000. Of the total, various State funds held \$175,600 in 1871 bonds, \$499,200 in 1873 bonds, and \$100,000 in the loan—total, \$774,800; leaving \$357,700 in bonds and \$100,000 in the loan in the hands of individuals. Among the treasury receipts was \$38,486.06 from the United States direct tax fund, of which the Governor paid \$22,569.23 to claimants, \$303.95 for securing data from Washington, and \$23.75 for advertising, leaving in his hand a balance of \$15,589.13.

Valuations.—The assessed valuations of taxable property in 1894 were: Real estate and railroad and telegraph property, \$86,679,656; personal property, \$17,464,949; total, \$104,144,605. The rate of assessment was about 35 per cent. of actual values, and the total assessment of 1894 was the highest ever made.

Banking.—Florida had on Oct. 31, 1894, 19 national banks in operation and 6 in process of liquidation. The combined capital of the active banks was \$1,485,000; amount of United States bonds held to secure circulation, \$430,000; excess beyond required amount, \$58,750; amount of coin and coin certificates held, \$107,338.39; notes issued for circulation, \$1,155,290; re-deemed, \$769,432, outstanding, \$385,858; deposits, \$4,430,793; loans and discounts, \$4,352,166; reserve required, \$664,619; and reserve held, \$902,741. There were also 18 State banks, with aggregate capital of \$435,500, deposits of \$781,638, surplus and profits of \$74,318, and total resources of \$1,830,750, and 2 savings banks with a combined capital of \$170,000; savings deposits, \$175,115; surplus and profits, \$9,372; and total resources, \$420,297.

Insurance.—In 1895 there were 57 insurance companies doing business in the State, of which 33 were fire companies, 13 life, and 11 miscellaneous. During 1894 these companies received in premiums \$1,239,058.43, and paid losses to the amount of \$249,795.34, leaving a net balance in their favor of \$989,263.09. Excluding 1 company which does both life and accident business, the life companies received in premiums, \$587,741.35, paid losses of \$65,063.70, and had a net balance of \$522,677.68. In six years the excess of premiums over losses of the life companies aggregated \$2,243,184.18. The large profits of these out-of-State companies have led to an agitation for the organization of local ones, that insurance interests may be kept within the State.

Education.—For the school year 1893-'94 the number of pupils enrolled in the schools was 96,775; average daily attendance, 64,138; male teachers, 294; female teachers, 1,629; total teachers, 2,923; average number of days the schools were kept, 97.4; and expenditures, excepting payments on debt, \$647,175. Of the total enrollment, 59,503 were white pupils and 37,272 colored; of the average daily attendance, 38,752 were white and 25,386 colored; and of the teachers, 2,151 were white and 772 colored.

Railroads.—On Dec. 31, 1893, there were 2,840.26 miles of single-track railroad in the State, and during 1894 6 lines constructed an aggregate of 85.95 miles, making a total on Jan. 1, 1895, of 2,926.21 miles. The capital account of the various roads showed a total investment of nearly \$80,000,000, of which over \$41,500,000 was in stock, and nearly \$32,500,000 in funded debt. The cost of the roads and equipments exceeded \$66,000,000; the gross earnings were about \$4,000,000; and the net earnings were \$1,000,000.

Taxable Manufactures.—In the fiscal year ending June 30, 1894, the collections of internal revenue in the 2 districts of Florida aggregated \$416,372.82, from the following sources: Distilled spirits, \$12,335.95; tobacco, \$396,553.46; fermented liquors, \$1,009.58; oleomargarine, \$3,364; and penalties, \$969.83. The same sources yielded a total in the year ending June 30, 1895, of \$470,763.03. In 1895 there were 400 single-account cigar factories, which used 2,466,811 pounds of tobacco for cigars and 3,348 pounds for cigarettes, and had an output of 147,802,909 cigars and 1,937,395 cigarettes; and 11 other factories which had a combined output of 17,182 pounds of smoking tobacco. The United States Commissioner of Internal Revenue also reported the receipt during the year of 3 claims for the sugar bounty, aggregating \$5,655.72.

Agriculture.—The principal crops of 1894 were: Corn, 516,242 acres, 5,214,044 bushels, value \$3,701,971; oats, 54,570 acres, 643,926 bushels, value \$392,795; potatoes, 1,422 acres, 127,980 bushels, value \$95,985; and hay, 6,719 acres, 8,264 tons, value \$134,290; total value, \$4,325,941. The cotton crop of 1894 was 45,637 bales, and that of 1895 60,000 bales.

Phosphates.—The phosphate industry has increased largely in the past three years, but low prices have prevailed. The direct shipments during 1893 were 319,674 tons, and during 1894 400,766 tons. Large quantities are known to have been shipped from Savannah and Brunswick, and sent to interior points by rail, and the total output of the State for 1894 was estimated at over 500,000 tons.

Other Industries.—The manufacturing and miscellaneous industries showed a total output valued at \$10,382,197, of which the principal were saw, planing, and shingle mills, \$5,872,708; mining, \$1,965,000; ice factories, \$408,780; fertilizer works, \$386,000; foundries and brick-yards, \$334,500; and fisheries, \$312,500. In October, 1895, reports from the orange groves indicated that no reliable estimate could be made of the orange production of the year; but it was believed that the yield would be sufficiently large to surprise those who had had the impression that all the trees in the State were destroyed by the freeze of the previous winter. There are a great many groves on the west coast that were scarcely touched by the frost, and most of those that were killed beyond hope of recovery were young trees. Comparatively few groves were abandoned. During 1895 about 8,000 acres were planted with watermelon seed, a large part of which was distributed gratuitously by the railroad companies. It was estimated that 3,000,000 marketable melons, worth 10 cents each,

would be grown from this area. Pineapple culture is being developed largely along Indian river, and there are 3 fine pineries near Orlando. In the interior the best results are obtained by growing the plants under cover.

Political.—In his message to the Legislature, April 1, 1895, Gov. Mitchell recommended a revision of the criminal laws and an amendment to the laws governing trials for murder that would avoid the result that a conviction of murder in the second degree can not be sustained by proof of murder in the first degree; urged the creation of a State board of equalization; referred to the Legislature complaints of the non-enforcement of laws for the protection of the fisheries; commended the quarantine and educational systems; asked to have prize fights, under whatever name, made felonies, with heavy penalties; urged an amendment of the law against lotteries that will prevent any from being located in the State; and recommended that officers giving bonds which for any reason become worthless be required to give new or additional ones.

FOOTBALL. From a schoolboy practice in the United States football has grown to be a national pastime almost as important as baseball. No American writer has yet given to the practice the honor said to have been attributed to it in England by the Duke of Wellington, and no football games are recorded in the civil war, although there is more than one account of a friendly mingling of the warring hosts in another American pastime, that of a snowball battle. An English writer has said that, in reality, all an Anglo-Saxon wants to make him happy, young or old, is some kind of ball to do things to. There is no better evidence of the value of football as a health-giving exercise than its quick adoption and wonderful popularity in France.

In the United States football has been deprived of some of those characteristics that make it valuable, because the American youth went in so strongly for it as to render a rough game a positively dangerous one.

The most serious trouble with football in the United States has been the difficulties over the rules. The Advisory Committee of the Inter-collegiate Football Association was not formed when Rugby football was introduced in this country. In its early days here the sport depended entirely upon the efforts of representatives whose term of office was usually only one year, and whose interest showed a bias dependent upon the immediate make-up of their respective teams. The personal bitterness sometimes arising over the interpretation of a rule in a match game was carried into these meetings and hampered the delegates. The games accordingly suffered, and the rules were not becoming better, but rather worse, when at a meeting of graduates, captains, and members of the college faculties assembled to consider the matter, it was proposed that the principal burden of rule making be transferred to a committee consisting of graduates. This action resolved itself, after much discussion, into the adoption of a new constitution for the football association, in which it was provided that all changes in the rules should emanate from an advisory committee of graduates. This commit-

tee meets and proposes any changes, and then submits them to the regular convention, which has always ratified them. A provision is made that in case the convention does not ratify the proposed alterations, they may still be carried by a majority vote of the advisory committee, failing which, they are dropped. This plan has worked well so far.

All expert football players know that, no matter how well the rules are made and laid down, their success depends largely upon the players.

The apparatus for a game of football is simple. The field is to be marked out with ordinary line lines, which for college games should inclose a space 330 feet long by 160 feet wide. While not absolutely necessary, it is customary to mark the field also with transverse lines every 5 yards, for the benefit of the referee in determining the distance the ball is advanced at every down. In the middle of the lines forming the ends of the field, the goal posts are erected, and they should be 18 feet 6 inches apart, with the crossbar 10 feet from the ground. The posts should extend several feet above the crossbar. The ball used is a round leather cover containing a rubber inner, which is inflated by means of a small air pump. The regulation ball at present is the Intercollegiate Match, No. J, adopted by the Intercollegiate Association.

Football players' costumes are of more moment with those who participate in the modern contests than they were when Tom Brown played the game at Rugby. These costumes should be of a most serviceable nature. A good football uniform costs more than any one would be willing to believe, looking at it after an afternoon of rough play. An innovation in this direction was tried by the Harvard College men two years ago in the form of leather suits. These are more expensive than the kind ordinarily in use, and on that account are little likely to become popular, though they are particularly light and good for rainy weather. The ordinary player should wear a canvas jacket. This should fit closely, but not too tightly, and lace up in front, so that it may be drawn quite tight. Some have elastic pieces set in at the sides, back, or arms; but these additions are by no means necessary. The trousers should be made of some stout material—fustian, for example—and well padded. Long woolen stockings are worn, and not infrequently shin guards by men playing in the forward line. The most important feature of the uniform is the shoes. These may be the ordinary canvas and leather baseball shoes with leather crosspieces nailed on the soles to prevent slipping. But the best ones are made entirely of leather, preferably kangaroo skin, fitting the foot firmly yet comfortably, lacing well up on the ankle, and the soles provided with a small leather spike, which can be renewed when worn down. Inside this shoe, and either attached to the bottom of it or not, as preferred, a thin leather ankle lace tightly over the foot, and is an almost sure preventive of sprained ankles. The cap, which, except in the cases of half backs and backs, does not play an important part, may be of almost any variety. Caps with visors to protect the eyes of the players in catching a long kick are the best.

Almost any kind of woolen underwear may be used; most players prefer knit jerseys. The quarter back, and sometimes the center rush, can with advantage do without the regulation canvas jacket and wear a jersey in its place.

There are 4 distinct forms of football which have attained popularity on both sides of the Atlantic. They are the Rugby game, which still flourishes in England and her colonies; the American college game; and the two principal styles, the college and the Gaelic, which attract the most attention in America. In the college and the Gaelic games the maximum and the minimum area of play is much the same. The exponents of these two styles use the round ball, while the Rugby players use an oval ball. The differences between the Gaelic and the college games are many and important. No college player, except the goal keeper, can use his hands in any movement of the game. Under the Gaelic rules the ball may be struck with the hand by any player. It may also be caught when off the ground, and the player so catching it may kick it any way he pleases, but must not throw it or carry it. To appreciate the distinction it is only necessary to watch a veteran at one style experimenting in a match under the other rules. A college recruit occasionally finds his way into a Gaelic game, and it is interesting to see him slowly realize that his superb kicking is powerless against the manipulation of the Gaels. After a few such experiences he begins to use his hands instinctively, and some followers of the game assert that there is no more deadly Gaelic player than a converted college player. A Gael, on the contrary, is palpably out of his element in a college game. He rushes at the ball with fist and foot alternately, whenever the referee relaxes his watchfulness. The scoring under Intercollegiate rules is by goals pure and simple. In the Gaelic games, while the goal is an important factor, it is not all, and a point may be scored when the ball is driven over the goal line within 21 feet of either goal post. This rule obliges the Gaelic men to cover 63 feet on the end line and accounts for the necessity of using more men in the game than are required in a college match. The charges on this extra line become terrific when "time" approaches and the value of the points is enhanced. Then the attacking forwards must show their worth, for if the defense gets time to mass its forces the line becomes impregnable.

Gaelic football has been played by the youth of Ireland for centuries, and is to-day one of the most popular sports in Ireland; matches there, as college games are here, being sometimes attended by nearly 30,000 people. The regular Gaelic team is composed of 15 players, distributed as follows: 1 goal keeper, 2 full backs, 2 half backs, 3 centers, 2 wing centers, 2 forwards, 2 wing forwards, and 1 full forward.

The college game, which is a modification of Rugby football, is the standard game in the United States. One of the first modifications of the old Rugby game in this country was an attempt to do away with some of the roughness of the English practices. A curious result of this was that the American game became even rougher than its English ancestor, and there was such an opposition developed to it that it

had to be remodeled, until now it is little enough like its parent, the Rugby game.

The game between Princeton and Harvard this year marked a new era in the sport, and was a triumph for the new rules. This contest was almost entirely free from the heavy massed plays that have done so much to discredit football. It was a free, running game, with a great deal of punting, and was consequently far more interesting to the average spectator than the old games with their dangerous roughness in which life and limb have both been lost. It demonstrated that football can be played in an open and gentlemanly, yet spirited and exciting fashion, without recourse to formations that take away much of the interest in the sport and render it a menace that parents and guardians of college youths do well to fear.

The set of rules got up for 1895 is that of 1894 made by the Rules Committee, composed of Alexander Moffat, of Princeton, William A. Brooks, of Harvard, Walter Camp, of Yale, Paul Dabiel, of Lehigh, and John C. Bell, of the University of Pennsylvania, improved and amended and approved by the University Athletic Club. Owing to the series of accidents that occurred as a result of mass plays in 1893, it was decided in 1894 to put a stop to this style of playing. The method used was the rule that not more than 3 men should start before the ball was put in play, nor should more than 3 men group themselves for that purpose more than 5 yards back of the point where the ball was put in play. All the elevens, however, managed in one way or another to circumvent this rule, and so in 1895 the Intercollegiate Association decided that not more than 1 man may start forward before the ball is put in play, and that not more than 3 men may group themselves back of the line. Thus it will be seen at least 7 men would have to be at the line of scrimmage until the ball is put in play, making wedge plays impracticable.

In 1894 the rules called for an umpire who had charge of the players and could disqualify any of them for violation of the rules. In 1895 the rule, as amended by Yale and Princeton, says that the officers of the game shall be an umpire, a referee, a linesman, and an assistant linesman. The important change in the rules in this regard is contained in the following lines: "Any officer may disqualify a player, subject to the approval of the umpire," and it goes on to say that the 3 leading officers shall, before the game, formulate rules governing the disposition of the ball in case it is obstructed by some person or object outside, and that the captain must abide by the rules laid down. There are 2 umpires, a referee, and a linesman in the Harvard, Cornell, and Pennsylvania games.

The following description will give the reader a good idea of how a game of Intercollegiate Association football is played: The two sides toss up, and the one winning the choice has the pick of goal or kick-off. If there is no advantage in the toss the winner may choose the kick-off, and his opponents in that case take whichever goal they like. The two teams then line up, the holders of the ball placing it upon the exact center of the field, and the opponents being obliged to stand back in their own territory at least 10

yards, until the ball has been touched with the foot. Some man of the side having the kick-off must then kick the ball at least 10 yards into the opponent's territory. Preferably, he will send it as far as he can and still have his forward reach the spot in season to prevent too great headway being acquired by the opponent's interference, but not into touch. The opponents then catch it and return it by a kick, or they run with it. If one of them runs with it he may be tackled by the opponents. As soon as the ball is fairly held—that is, both player and ball brought to a standstill—the runner must cry "Down!" and some one on his side, usually the man called the half back or center rush, must place the ball on the ground at that spot for a "scrimmage," as it is termed. The ball is then put in play again (while the men of each team keep on their own side of the ball, under the penalty of a foul for off-side play) by the snap backs kicking the ball or snapping it back, either with his foot or, more commonly, with his hand, to a player of his own side just behind him, who is called the quarter back. The ball is in play, and both sides may press forward as soon as the ball is put in motion by the snap back. Naturally, however, as the quarter back usually passes it still farther behind him to a half back or back, to kick or run with, it is the opposing side which is most anxious to push forward, while the side having the ball endeavors by all lawful means to retard that advance until their runner or kicker has had time to execute his play. It is this antagonism of desire on the part of both sides that has given rise to the special legislation regarding the use of the hands, body, and arms of the contestants. As soon as the snap back has sent the ball behind him he has really placed all the men in his own line "off-side"—that is, between the ball and the opponents' goal—and they, therefore, can theoretically only occupy the position in which they stand, while the opponents have the legal right to run past them as quickly as possible.

The game thus progresses in a series of "downs," followed by runs or kicks, as the case may be, the only limitation being that of a rule designed to prevent one side continually keeping possession of the ball without any material advance or retreat, which would be manifestly unfair to the opponents. This rule provides that in three "downs," or attempts to advance the ball, a side not having made 5 yards toward the opponents' goal or retreated 20 yards toward their own goal must surrender the ball.

There is one other element entering into the progress of the game, and that is the fair catch. This can be made from a kick by the opponents, providing that the catcher takes the ball on the fly and, no other of his own side touching it, plants his heel in the ground at the spot where the catch is made. This entitles him to a free kick—that is, his opponents can not come beyond his mark, made by heeling the catch, while he and his side may retire such distance toward his own goal as he sees fit and then make a punt or a drop, or give the ball to some one of his own side for a scrimmage, or to place the ball for a place kick. Here, again, as at kick-off, if he takes a free kick he must make an actual kick of at least 10 yards, unless the ball is stopped by

the opponents. His own men must be behind the ball when he kicks it or be adjudged off-side, unless the ball is put in play by a scrimmage, when the regular rules for scrimmage govern. When the ball goes across the side boundary line of the field it is said to go "into touch," and it must be at once brought back to the point where it crossed the line, and then put in play by some member of the side which carried it out or first secured possession of it after it went out. The methods of putting it in play are as follow: To touch it in at right angles to the touch line and then kick it, or, most commonly, walk into the field and make an ordinary scrimmage of it, the same as after a down. In this latter case the player who intends walking in with it must, before stepping into the field, declare how many paces he will walk in, in order that the opponents may know where the ball will be put in play. He must walk in at least 5 and not more than 15 yards. He must bear in mind that the conditions are considerably changed by the new rules, for now upon any first down when inside the 25-yard line, if he try a drop kick and fail to score, the ball can be brought out, not for a 25-yard-line kick-out, but only a 10-yard one—that is, his side can line up at 10 yards, so that the defenders of the goal are actually forced to kick out from almost within their own goal. The touchdown itself will count 4 points. A goal kick from field counts 5 points. In placing the ball, it is held in the hands of the placer, close to, but not touching the ground, and then carefully aimed until the direction is proper. Then, at a signal from the kicker that it is right, it is placed upon the ground, still steadied by the hand or finger of the placer, and instantly kicked by the place kicker. The ball is also taken to the center of the field if the goal be missed, although formerly the opponents could then bring it out only to the 25-yard line. There is one issue to be considered at this point, and that is, if the ball be in the possession of the defenders of the goal, or if it fall into their hands when thus close to their own goal, a player may at any time kick, pass, or carry the ball across his own goal line and there touch it down for safety. This, while it has caused two points for his opponents, gives his side the privilege of bringing the ball out to the 25-yard line and then taking a kick-out, performed like a kick-off or any other free kick, but it can be a drop kick, a place kick, or a punt. This succession of plays continues for thirty-five minutes in a regular match. Then intervenes a ten-minute intermission, after which the side that did not have the kick-off at the beginning of the match has possession of the ball for the kick-off at the second thirty-five minutes.

An Intercollegiate Association football team of 11 men is generally divided as follows: There are 7 rushers, or linemen, who stand in a line facing their 7 opponents; a quarter back, whose place is just behind this line; 2 half backs, a few yards behind the quarter back; and finally a full back, or goal tend, whose place is a dozen yards behind the half backs. This gives the general formation, but it is of course dependent upon the plays to be made.

The result of an Intercollegiate Association match at football is determined by the number

of points scored during the 2 halves, a goal from a touchdown yielding 2 points, one from the field—that is, one without the aid of a touchdown—5 points; a touchdown from which no goal is kicked giving 4 points, and a safety giving 2 points for the opponents.

The following is a short explanation of the various terms used in describing football plays:

A *drop kick* is made by letting the ball drop from the hands and kicking it as it rises from the ground.

A *place kick* is made by kicking the ball after it has been placed on the ground.

A *punt* is made by letting the ball fall from the hands and kicking it before it touches the ground.

Kick off is a place kick from the center of the field of play.

Kick out is a drop kick or place kick by a player of the side that has touched the ball down in their goal or into whose touch-in-goal the ball has gone.

In touch means out of bounds.

A *fair* is putting the ball in play from touch.

A *foul* is any violation of the rules.

A *touchdown* is made when the ball is carried, kicked, or passed across the goal lines and there held either in goal or touch-in-goal.

A *safety* is made when a player, guarding his goal, receives the ball from a player of his own side and touches it down behind his goal line, or carries the ball across his own goal line and touches it down, or puts the ball into his own touch-in-goal.

A *touchback* is made when a player touches the ball to the ground behind his own goal, the impetus which sent the ball across the line having been received from an opponent.

A *fair catch* is a catch made direct from a kick by one of the opponents, provided the catcher made a mark with his heel at the spot where he made the catch.

Interference is using the hands or arms in any way to obstruct or hold a player who has not the ball.

The penalty for fouls and violation of the rules, except otherwise provided, is a down for the other side or, if the side making the foul has not the ball, 10 yards to the opponents.

A *free kick* is a kick taken when the opponents are forbidden by rule to advance beyond a certain point.

Charging is rushing forward to seize the ball or tackle a player.

FRANCE, a republic in western Europe, proclaimed on Sept. 4, 1870, upon the deposition of the Emperor Napoleon III, and declared permanent in the Constitution of June 16, 1875. The President of the republic is elected for seven years by an absolute majority of the National Assembly, united in Congress. The National Assembly consists of a Senate and a Chamber of Deputies. The Senate has 300 members, one third of whom are renewed every three years, the term being nine years. They are elected by commissions in the several departments and colonies. There were formerly 75 life Senators, elected by the National Assembly, but this number was reduced by death to 23 in 1893, the seats as they fall vacant being filled since 1894 by election in the ordinary manner. Deputies of whom there are 584, are elected by districts, each *arrondissement* forming an electoral district or being divided into two in case it exceeds 100,000 in population. A bill introduced in either chamber by the Government or by private members is referred to its appropriate bureau for examination, and afterward to a commission of parliamentary initiative. All money bills must be introduced in the Chamber of Deputies.

The President of the republic is François

Félix Faure, elected Jan. 17, 1895, to succeed Jean Casimir-Perier, who resigned.

The following ministers were in office at the opening of 1895: Premier, Minister of the Interior, and Minister of Public Worship, Charles Dupuy; Minister of Finance, M. Poincaré; Minister of Justice, M. Guérin; Minister of Public Instruction, Georges Leygues; Minister of Foreign Affairs, M. Hanotaux; Minister of War, Gen. Mordier; Minister of Marine, Félix Faure; Minister of the Colonies, M. Delcassé; Minister of Commerce, M. Lourties; Minister of Agriculture, Albert Viger.

Area and Population.—The area of France is 304,002 square miles. The legal population on April 12, 1891, was 38,243,192, an increase of only 124,280 in five years. The population present at the taking of the census was 38,133,365, 146,811 more than in 1886. Of the total, 18,332,254, or 49.65 per cent., were males and 19,801,031, or 50.35 per cent., were females. The number of resident foreigners in 1891 was 1,180,311, and the number of French citizens abroad was 517,000. The number of employers and self-dependent persons was 7,671,398; of clerks, overseers, etc., 899,099; of workmen, 2,104,850; of dependent women, children, etc., 19,544,537; of domestic servants, 1,692,432. There were 17,435,888 persons dependent upon agriculturists, 9,562,560 upon industry, 1,199,333 upon transportation, 3,961,496 upon commerce, 715,694 in the public force, 699,611 dependent upon the civil administration, 1,114,873 upon the professions, and 2,160,750 upon private fortunes. The number of marriages in 1893 was 287,294; of births, 874,072; of deaths, 867,526; excess of births, 7,146. The number of emigrants in 1892 was 5,528, of whom 2,798 went to the United States, 2,106 to the Argentine Republic and Uruguay, 155 to Chili and Peru, and 469 to other countries. The population of the principal cities in 1890 was: Paris, 2,447,957; Lyons, 416,029; Marseilles, 403,749; Bordeaux, 252,415; Lille, 201,211; Toulouse, 149,791; St. Etienne, 125,449; Nantes, 122,750; Havre, 116,369; Rouen, 114,917; Rouen, 112,352; Rheims, 104,186.

The Army.—The French army is organized as follows: Infantry—145 divisional infantry regiments, 18 regional regiments, 30 battalions of foot chasseurs, 4 regiments of zouaves, 4 regiments of Algerian tirailleurs, 2 regiments of the foreign legion, and 5 battalions of Algerian light infantry. Cavalry—13 regiments of cuirassiers, 30 of dragoons, 21 of chasseurs, 13 of hussars, 6 of African chasseurs, 4 of spahis, and 8 companies of mounted. Artillery—38 regiments of field artillery, 16 battalions of fortress artillery, 4 batteries, 4 mounted, and 8 mountain batteries in Algeria and Corsica, 2 pontoon regiments, and 10 companies of workmen and 3 of artificers. Engineers—4 regiments of sappers and miners and 1 regiment of railroad sappers. Train—20 squadrons and 11 companies in Africa.

The effective strength of the active army, deduction being made of men in hospital or on furlough, was 524,768 officers and men. The war strength of the nation is estimated as follows: Active army and reserve, 2,350,000; territorial army, 900,000; territorial reserve, 1,100,000; total, 4,350,000. The number of trained men available is believed to be 2,500,000.

The strength of the army provided for in the budget for 1895 was 28,785 officers and 509,229 men. The strength and distribution of the various arms and services were as follow:

DESCRIPTION OF TROOPS.	France.	Algeria.	Tunisi.	Total.
General staff.....	4,166	320	77	4,563
Military schools.....	2,149	—	—	2,149
Unattached.....	2,000	149	191	2,340
Gendarmes.....	21,306	1,172	154	22,632
Garde Républicaine....	3,500	—	—	3,500
Army corps:				
Infantry.....	314,744	34,604	9,719	359,067

Total army corps.....	499,746	54,230	13,106	567,082
Total.....	507,737	55,287	13,200	576,224

The Navy.—The effective navy in 1894 was as follows: Twenty-seven armor-clad battleships ("Admiral Baudin," "Admiral Duperré," "Colbert," "Dévastation," "Formidable," "Courbet," "Friedland," "Hoche," "Magenta," "Marceau," "Marengo," "Neptune," "Océan," "Redoutable," "Richelieu," "Suffren," "Trident," "Brennus," "Calman," "Indomptable," "Requin," "Terrible," "Bouvines," "Jemmapes," "Valmy," "Charles Martel," and "Jauréguiberry"); 7 armored cruisers ("Bayard," "Duguesclin," "La Galissonnière," "Triomphante," "Turenne," "Vanban," and "Victorieuse"); 9 armor-clad coast guards ("Hélène," "Bouladour," "Fulminant," "Furieux," "Onondaga," "Trompette," "Tonnerre," "Tonnant," and "Vengeur"); 8 armored gunboats ("Fusée," "Flamme," "Grenade," "Achéron," "Cocyte," "Mitraille," "Phibgeton," and "Styx"); 12 first-class cruisers ("Dupuy-de-Lôme," "Charner," "Chanry," "Latouche-Treville," "Duguesne," "Tourville," "Sfax," "Tage," "Cécille," "Jean-Bart," "Alger," and "Isly"); 10 second- and 28 third-class cruisers; 6 torpedo cruisers; 7 first- and 5 second-class avisos; 13 aviso transports; 10 torpedo avisos; 13 gunboats; 26 sloop gunboats; 16 steam launches; 31 seagoing torpedo boats; 66 first-, 84 second-, and 41 third-class torpedo boats; 6 torpedo vedettes; 1 fleet transport; and 7 first-, 5 second-, and 6 third-class transports. The whole fleet of 444 vessels had an aggregate displacement of 608,293 tons, engines of 671,366 horse power, 3,172 guns, 190 torpedo ejectors, and 30,842 men.

The programme of construction showed the following vessels of various classes launched or on the stocks: 7 line-of-battle ships; 2 first-, 6 second-, and 2 third-class cruisers; 1 torpedo cruiser; 1 aviso transport; 2 torpedo avisos; and 52 seagoing torpedo boats.

The ironclad "Massena" was launched on July 24. The cruiser "Pothuon" was launched on Sept. 19. The torpedo-boat destroyer "Cassabianca," launched on Sept. 21, was designed for a speed of 21½ knots. A new seagoing torpedo boat, the "Furber," made 31 knots in its trial trip in September. A second-class cruiser, launched at Toulon on Sept. 26, carries a 164-centimetre gun, with 28 smaller ones, and 2 torpedo tubes. In the new ships preference is given to guns of small caliber, which can be

easily worked and fired with rapidity. New explosives are now used in the medium as well as in the heavy shells. A gun of 75 centimetres has been adopted, with a length 40 times the caliber, firing a bronze-coated projectile with a new powder.

Since 1891 there have disappeared from the list of the navy 57 vessels that cost 94,791,000 francs, while 31 vessels, costing 552,453,000 francs, have been added, though some of these are still in process of construction. The expenditure on the navy has increased from 41,505,000 francs (being 17.9 per cent. of the total budget) in 1891 to 32,221,000 francs (which is 21.4 per cent. of the budget) in 1896.

Finances.—Of the total revenue of the Government about 16 per cent. is derived from direct contributions, 63 per cent. from indirect taxes, and 21 per cent. from monopolies, posts, and telegraphs, and domains and forests. The direct imposts are a tax on land and buildings, a tax imposed in 1895 on dwellings proportioned to house rent, a tax on domestic servants, taxes on horses and carriages and on bicycles, a military tax, a tax on property held in mortmain, a trade-license tax, mining royalties, etc. The principal indirect taxes are customs, registration dues for transfers of property, obligations, etc., stamps, and the excise duty on sugar. The budget estimates for 1895 make the total ordinary revenue 3,237,503,172 francs (1 franc = 19.3 cents), of which 520,699,467 are direct taxes, 2,050,518,680 francs indirect taxes, and 678,622,820 francs the revenue from monopolies and state property. The receipts from the various sources were estimated as follow: Land tax, 118,160,025 francs; tax on buildings, 98,895,439 francs; tax on habitations, 122,297,788 francs; tax on servants, 19,183,883 francs; trade licenses, 124,119,192 francs; *premier avertissement*, 1,050,850 francs; tax on carriages and horses, 36,992,290 francs; registration, 530,149,300 francs; stamps, 168,828,500 francs; customs, 473,655,195 francs; tax on movables, 66,250,500 francs; sugar duty, 199,000,000 francs; other indirect taxes, 600,297,300 francs; tobacco *régie*, 374,577,700 francs; matches and gunpowder, 39,118,600 francs; post office, telegraphs, and telephones, 209,588,300 francs; domains and forests, 44,787,236 francs; other state property, 10,551,060 francs. Various extraordinary revenues amounted to 58,550,892 francs, receipts from exceptional sources to 29,669,402 francs, the *recettes d'ordre*, which are simply transfers in bookkeeping, to 74,447,084 francs, and the receipts in Algeria to 48,291,150 francs, making the total revenue 3,439,031,032 francs.

The total expenditure for 1895 was estimated at 3,423,863,762 francs. The expenditures under the various heads were as follow: Public debt, 1,235,347,273 francs; President, Senate, and Chamber, 13,171,720 francs; Ministry of Finance, 19,697,948 francs; Ministry of Justice, 35,133,100 francs; Ministry of Foreign Affairs, 16,463,800 francs; Ministry of the Interior, 76,585,144 francs; Ministry of War, 607,261,898 francs for ordinary, and 40,823,907 francs for extraordinary purposes; Ministry of Marine, 277,516,311 francs; Ministry of Education and Worship, 192,986,240 francs for instruction, 8,157,065 francs for fine arts, and 44,175,953

francs for worship; Ministry of Commerce, Industry, Posts, and Telegraphs, 190,607,754 francs; Ministry of the Colonies, 81,889,143 francs; Ministry of Agriculture, 43,403,560 francs; Ministry of Public Works, 233,930,864 francs; *régie*, collection of taxes, etc., 190,834,140 francs; repayments, etc., 34,116,000 francs; Algeria, 73,851,842 francs.

The public debt in 1893 was computed to amount to the capital sum of 30,611,685,122 francs. For the last ten years the increase has been slow compared with the preceding decade. The expenses of the debt for 1895 were 1,235,347,273 francs, of which 693,768,581 francs were for the consolidated debt, 248,417,489 francs for interest on, and 64,096,615 francs for amortization of the redeemable debt, and 229,064,588 francs on account of the floating debt.

Commerce and Production.—The general commerce in 1893 amounted to 4,951,000,000 francs for imports and 4,326,000,000 francs for exports. The total value of the special imports was 3,854,000,000 francs, in which sum 1,061,000,000 francs represent alimentary substances, 2,229,000,000 francs raw materials, and 564,000,000 francs manufactured goods. The total value of the special or domestic exports was 3,236,000,000 francs, of which 710,000,000 francs stand for alimentary substances, 784,000,000 francs for raw materials, and 1,742,000,000 francs for manufactured products. The chief articles of import and their values were: Wool, 325,000,000 francs; cereals, 307,000,000 francs; raw silk, 261,000,000 francs; oil seeds, 188,000,000 francs; raw cotton, 184,000,000 francs; wine, 183,000,000 francs; coal, 164,000,000 francs; coffee, 146,000,000 francs; skins and furs, 146,000,000 francs; timber, 124,000,000 francs; flax, 70,000,000 francs; ores, 62,000,000 francs; sugar, 58,000,000 francs; machinery, 55,000,000 francs; chemical products, 54,000,000 francs; silk goods, 51,000,000 francs; woollen goods, 50,000,000 francs; fish, 45,000,000 francs; cattle, 42,000,000 francs; table fruits, 39,000,000 francs; cotton goods, 33,000,000 francs; cotton yarn, 18,000,000 francs.

The values of the largest exports were: Woollen cloth, 279,000,000 francs; silk goods, 225,000,000 francs; wine, 189,000,000 francs; fancy articles, 154,000,000 francs; linen cloth and yarn, 131,000,000 francs; raw silk and yarn, 126,000,000 francs; raw wool and woollen yarn, 120,000,000 francs; cotton cloth, 101,000,000 francs; apparel, 119,000,000 francs; copper manufactures, 111,000,000 francs; leather, 97,000,000 francs; leather goods, 96,000,000 francs; butter and cheese, 81,000,000 francs; tools and hardware, 70,000,000 francs; animals, 68,000,000 francs; skins and furs, 62,000,000 francs; liquors, 56,000,000 francs; chemical products, 53,000,000 francs; table fruits, 45,000,000 francs; novelties, 42,000,000 francs; cereals, 37,000,000 francs; oil, 34,000,000 francs; machinery, 32,000,000 francs.

The crop of wheat in 1893 was 97,792,000 hectolitres, or 261,000,000 bushels; of rye, 22,516,000 hectolitres, or 63,000,000 bushels; of sugar beet, 60,469,000 quintals; of wine, 50,703,000 hectolitres, or 1,104,000,000 gallons. The imports of wine were 5,583,584, and the exports 1,560,242 hectolitres. The area of vineyards decreased from

2,246,063 hectares in 1875 to 1,702,816 in 1892, increased in 1893 to 1,821,155 in 1893, and then further decreased to 1,766,841 in 1894. The production of cocoons in 1893 was 9,987,110 kilogrammes; there were 300,254 kilogrammes exported; besides 2,236,002 kilogrammes of raw silk. The product of coal in 1892 was 26,178,701 tons; of pig iron, 2,057,300 tons. The imports of flax in 1893 were 83,403,473 kilogrammes; of hemp, 17,432,954 kilogrammes; of jute, 59,519,794 kilogrammes. The product of refined sugar was 512,124 metric tons.

This table shows the special trade in 1893, in France, with the principal foreign countries:

COUNTRIES.	Imports.	Exports.
Great Britain.....	492,000,000	941,000,000
Germany.....	305,000,000	265,000,000
Belgium.....	338,000,000	304,000,000
United States.....	317,000,000	295,000,000
Spain.....	142,000,000	185,000,000
Italy.....	208,000,000	114,000,000
Portugal.....	151,000,000	128,000,000

Navigation.—During 1893 there were 95,005 vessels, of 20,369,305 tons, entered at French ports, and 95,744, of 20,683,943 tons, cleared. Of the former 8,259, of 4,091,847 tons, were French vessels engaged in foreign commerce or the sea fisheries, 66,362, of 6,515,461 tons, were French coasting vessels, and 20,384, of 9,761,997 tons, were foreign vessels. There were entered with cargoes 77,824 vessels, of 18,729,668 tons, and in ballast 17,181 vessels, of 1,639,637 tons, and cleared with cargoes 72,639 vessels, of 14,404,737 tons, and in ballast 23,105, of 6,279,206 tons.

The commercial navy on Jan. 1, 1894, numbered 14,190 sailing vessels, of 396,582 tons, and 1,196 steamers, of 498,841 tons. There were 69,303 sailors on the sailing vessels, and 14,374 men employed on the steamers. There were 297 sailing vessels, of 139,772 tons, and 180 steamers, of 277,037 tons, making ocean voyages, and 256 sailing vessels, of 28,149 tons, and 223 steamers, of 158,716 tons, engaged in European commerce.

Railroads, Posts, and Telegraphs.—There were 22,561 miles of railroads in operation in 1894. The aggregate cost of construction amounted in 1892, when there were 21,661 miles, to nearly 15,000,000,000 francs. The number of passengers carried in 1892 was 288,077,679; tons of freight, 95,712,971. The receipts were 1,194,000,000 francs, and expenses 668,740,000 francs. The railroads will eventually revert to the Government, which now owns only 2,728 kilometres out of the total length of 35,750 kilometres.

The telegraphs, which are the property of the state, had a total length on Jan. 1, 1893, of 59,003 miles, with 197,623 miles of wire. The number of dispatches sent and received in 1892 was 43,328,888, of which 33,439,947 were paid international messages, 5,806,337 were international, 1,571,168 in transit, and 5,011,436 official. The receipts were 35,330,152 francs.

The post office in 1892 carried in France and Algeria 708,648,000 domestic and 135,918,000 foreign letters, 34,664,000 domestic and 2,075,000 foreign registered letters, 45,435,000 domestic

and 5,943,000 foreign postal cards, and 912,190,000 domestic and 125,582,000 foreign circulars, samples, etc. The receipts in France alone were 200,781,535, and expenses 133,831,678 francs.

The Presidential Crisis.—The parliamentary session was opened on Jan. 8, 1895. Henri Brisson, the candidate of the Radicals and Socialists, who was elected president of the Chamber Dec. 19, 1894, after the death of M. Burdeau, was now re-elected by 271 out of 281 ballots, many Moderates abstaining. This was a new rebuke to the Dupuy Cabinet for covering up financial scandals. The Chamber refused the demand of the Socialists for the liberation of M. Gérault-Richard, who had been elected to a seat by the artisan constituency of Gobelins while he was serving out a sentence for insulting the President of the republic in a newspaper article. The Socialists attacked the Government with such ferocity that Jaures and Rouanet were suspended. The action of the Opportunists and Moderate Republicans in stifling the Panama and other investigations lest the republic should be discredited and endangered by the disgrace of some of its prominent men was the chief subject of the scornful reproaches of the Socialists and Radicals, who had the silent support and in critical divisions the votes of the Monarchists and Clericals. A judicial decision of the Council of State on the interpretation of conventions made in 1883 by M. Raynal, Minister of Public Works in the Cabinet of Jules Ferry, brought under discussion one of the most suspicious and momentous acts in the financial history of the third republic. Instead of making arrangements to take over the railroads as the property of the state upon the lapse of their charters, the Government renewed at that time its contracts with the companies on condition that they should build certain strategical and local lines and abate their rates. In the conventions with the Orleans and Midi railroads M. Raynal omitted to fix a period for the termination of the guarantee of interest. The Council of State now decided that the guarantee, under which the Government had already paid out to these particular companies more than 50,000,000 francs, and which might cost over a milliard in the aggregate, would not cease in 1914, but will run till the termination of the new contracts, fifty years later. M. Barthou, the Minister of Public Works, who thought the decision wrong in law, resigned his portfolio, but his colleagues accepted it as final. On the motion of M. Millerand the Chamber decided, on Jan. 14, that Raynal's conduct should be investigated. An order of the day affirming the separation of the judicial and executive powers was offered for the vindication of the Government, and when a counter-resolution to reserve the rights of the state was carried, the ministers resigned in a body.

President Casimir-Périer, the conspicuous mark for most insulting vituperation in the Socialist and Reactionary sheets, was dragged into the discussion of the Southern Railway scandal, through his having been a friend of Raynal. Instead of accepting the resignations of his Cabinet he resigned his own office on Jan. 15 in a message to the Chambers, in which he said:

I never concealed from myself the difficulties of the task imposed upon me by the National Assembly. I

foresee them. If a man does not refuse a post at the moment of danger he preserves his dignity only in the conviction that he is serving his country. The presidency of the republic, deprived of means of action and control, can derive from the confidence of the nation alone the moral force without which it is nothing. I doubt neither the common sense nor the justice of France, but the attempt to mislead public opinion has succeeded. More than twenty years of conflict for the same cause, more than twenty years of attachment to the republic and of devotion to the democracy, have not sufficed either to convince all Republicans of the sincerity and ardor of my political faith or to disabuse the adversaries who believe, or affect to believe, that I shall become the instrument of their passions and their hopes. For six months a campaign of slander and insult has been going on against the army, the magistracy, Parliament, and the irresponsible head of the state, and this liberty of fanning social animosities continues to be styled liberty of thought. The respect and the ambition which I cherish for my country do not allow me to admit that the country's best servants and he who represents it in the eyes of the foreigner may be insulted daily. I will not consent to bear the weight of the moral responsibility resting upon me in the condition of powerlessness to which I am condemned.

I shall, perhaps, be understood when I affirm that constitutional fictions can not silence the dictates of the political conscience. Perhaps in resigning my functions I shall have marked out the duty of those who are mindful of the dignity of power and of the good name of France in the world. Invariably true to myself, I remain convinced that reforms will be effected only with the active co-operation of a Government resolved on insuring respect for the law, on enforcing obedience from its subordinates, and on rallying them all in common action for a common work. I have faith, notwithstanding the sadness of this hour, in a future progress and social justice.

The Congress for the election of a new President was held on Jan. 17. M. Waldeck-Rousseau was the public choice of the Moderate Republicans, but on the first ballot he received only 185 votes, while Félix Faure, who had been proposed a week before as a competitor of Brisson for the presidency of the Chamber, got 244 votes, and Henri Brisson 338. On the second ballot, Waldeck-Rousseau withdrawing, M. Faure was elected by 438 votes, against 363 given to M. Brisson. The President-elect accepted the office with a speech in which he said:

I cease from now to belong to a party, in order to become the arbiter of all parties. It is in this spirit that without distinction of the various shades of Republican opinion I appeal for aid to all the representatives of the country. We shall always meet on common ground in any work inspired by love of country, devotion to the republic, anxiety for justice, and solicitude for the lot of all our fellow-citizens, especially the lowly and humble.

The Ribot Ministry.—Léon Bourgeois, the chief Radical exponent of the policy of Republican concentration, was intrusted with the task of forming a ministry. He sought the co-operation of M. Poincaré and other Moderates, but the progressive income tax, which with a general amnesty formed his programme, proved a stumbling-block. On Jan. 25 the President turned to M. Ribot, who on Jan. 27 completed a Cabinet containing some Moderate Radicals and differing little in general political cast from the fallen Cabinet. It was composed as follows: President of the Council and Minister of Finance, Alexandre Félix Ribot; Minister of the Interior, Georges Leygues; Minister of Foreign Af-

fairs, G. Hanotaux; Minister of Justice, Jacques Ludovic Trarieux; Minister of Public Instruction and of Worship, R. Poincaré; Minister of Commerce, André Lebon; Minister of Agriculture, Dr. Gadaud; Minister of the Colonies, Émile Chautemps; Minister of Public Works, M. Dupuy-Dutemps; Minister of War, Gen. Zurlinden; Minister of Marine, Vice-Admiral Besnard.

In his message to the Chambers President Faure, speaking of himself as a representative of the industrious democracy whom the National Assembly had elevated as a tribute of honor to quiet labor that is constantly accomplishing something for the greatness of the fatherland, vaunted the perfect calm and unshaken confidence that marked the transmission of powers, demonstrating again that France feels herself mistress of her destinies under the protection of republican laws. He pledged himself to watch vigilantly the observance of the constitutional laws and see to the regular and loyal working of the parliamentary system, and spoke of the general task of the Legislature and the immediate programme of the Government as follows:

France does not confuse barren agitation with the incessant pursuit of progress. Strong in her probity, proud of her thrift, accessible to every generous idea, she is a slave of no preconceived theory, but is interested in all the great problems which throughout the world are exciting the attention of men's minds. To seek solutions of these problems so as to adapt them to the national genius, to our traditions, to our habits and customs, is the essential work that we have to pursue. All men of good will will unite in a single idea of conciliation, pacification, and social justice in order to secure by general concord and republican fraternity the continuous development of material and moral well-being. Contemplating with a just pride her army and navy, sufficiently strong to have a right to proclaim her love of peace, having won sympathies which are precious to her and to which she remains faithfully attached, France, in a fresh effort toward progress, is preparing to invite the nations to a great festival of labor, which will be a worthy crown to the century which is about to close. In literature, art, and science, in industry, commerce, and agriculture, everywhere is displayed the fruitful activity of the country. In the compact ranks of universal suffrage, as in the political world, the same ardor must unite all who have at heart the luster of the French name. It is to this union, to this common effort for the power and glory of the French republic, that I invite you, certain that I am the mouthpiece of our entire democracy.

Legislation.—The first bill presented by the Government was one granting amnesty for all persons under sentence for violating the press laws and laws of public meeting and association or for crimes against public security, electoral offenses, or offenses connected with strikes. This bill, which the Chamber had rejected while insulters of President Casimir-Périer were being frequently convicted, was now passed with only 7 contrary votes and went through the Senate without opposition. The Abbé Lemire seized the opportunity to request the restoration of their stipends to priests who had incurred disciplinary measures for political indiscretions, to which the Chamber agreed.

To satisfy the Radical allies of the Government, who carried a resolution in favor of imposing a part of the new taxes upon religious

corporations, a law was enacted on April 16 that places a special tax on the property of religious congregations. Unauthorized religious communities were further subjected to a differential duty. The impost is only $\frac{1}{2}$ of 1 per cent. on the gross value of the property, but the congregations are required to furnish stamped declarations of their property in each commune, which makes the tax in some cases almost 10 per cent. of their incomes. Most of the clergy were disposed at first to resist the law, but the sentiment in favor of submission finally prevailed. M. Goblet, leader of the Socialist-Radicals, obtained 191 votes on July 12 for a resolution calling upon the Government to prepare measures for the separation of the church and the state. The order of the day sustaining the Government by 294 votes to 193 expressed confidence in the firmness of the Government to secure the observance of the law and respect for civil authority and to maintain the rights of the state.

The Socialists in the Chamber made the most of the case of Gérault-Richard and that of Mirman, a Deputy, who resigned a professorship in order to fulfill his duties as a legislator, and by doing so forfeited his immunity from military service and was drafted into the army and thus prevented from sitting in the Chamber. A law was passed making any person who has not completed his service in the army ineligible. In some cases is elected, however, under similar circumstances to those of Mirman's election, he is assigned to the reserve and not deprived of his seat. A bill was prepared by the Minister of Justice that allows persons employed in the tobacco and match factories of the state to form labor unions and exercise all the rights of ordinary workmen, but forbids strikes among the employees of arsenals and state railroads. The latter, being exempt from military service, were required to forego their rights in the interest of national defense. The employees in the match factories immediately availed themselves of this right to strike, and M. Ribot recognized their union. Their grievances were investigated and an advance in the wages from 5 francs 10 centimes to 5 $\frac{1}{2}$ francs a day was agreed upon by a joint delegation. The Socialists submitted a bill by which illegitimate children would have the same rights to inheritance as legitimate ones. They urged in support of the bill that illegitimate births are steadily increasing, being 8.7 per cent. of the total number, against 7 per cent. in 1872. A proposal of Aude Lestre, a Christian Socialist, to simplify the conditions of marriage by dispensing with the consent of grandparents when the parents are dead was agreed to, but a motion to dispense with the consent of parents when the bridegroom is twenty-five years old and the bride twenty-one was lost by 308 votes to 233.

The Radicals and Socialists charged that the committee appointed to investigate Raynal was selected for the purpose of stifling the inquiry. Only one Extremist was placed on the committee, and he refused to serve.

When the Government was questioned on June 1 in regard to the syndicates of the Southern Railroad and charged with screening scandals, M. Trarieux said there would be no prosecutions. Ex-Premier Rouvier and Jules Roche,

an ex-minister that had participated in the profits of the syndicates of Baron Reinach, who was said to have used 1,231,000 francs of the company's money to bribe legislators, asserted that they had a right to speculate in syndicate shares. A resolution expressing confidence in the Government's insuring the action of justice against financial scandals before statutory limitation could be pleaded was carried after the rejection of a vote of censure by only 25 majority. Only 10 votes were given against a resolution that legislators ought to hold aloof from financial syndicates. After the close of the session Félix Martin, manager, and 2 directors, Robin and André, were arrested on the charge of misappropriating the funds of the Southern or Riviera railroad. Senator Edmond Magnier, editor of the Paris "Événement," was also committed for trial, being accused of accepting a bribe of 87,500 francs, but he evaded arrest. The railroad officials were ultimately acquitted. Senator Magnier afterward returned, surrendered himself, and was tried and convicted and condemned to one year's imprisonment.

Earlier in the year another scandal affecting Parisian newspapers came out in the courts. A number of journalists, including Portalis, editor of the "Dix-neuvième Siècle," and Canivet, president of the Press Association and editor of the "Paris," were prosecuted for blackmailing proprietors of gambling clubs, and some of them, including Camille Dreyfus, an ex-Deputy and editor of the "Nation," were sentenced to imprisonment for one or two years. Dreyfus obtained bribes from bookmakers by threatening to bring in a bill to suppress their business.

The council of the Legion of Honor resigned because the Chamber of Deputies on July 13 passed a unanimous resolution blaming them for paying too little attention to the decisions of the courts. The occasion of the censure was that they had not stricken the name of M. Eiffel from the list of the order after he was convicted of misappropriation of funds.

Bills for reforesting mountains in order to prevent inundations were approved. A resolution in favor of an international treaty of arbitration with the United States was passed by the Chamber almost unanimously.

A bill was passed giving to all persons who have been insured in benefit societies or the Caisse Nationale for fifteen years a minimum pension of 360 francs from the age of seventy. For those supplementary labor superannuation pensions a sum of 2,000,000 francs was inserted in the budget.

The Minister of War proposed to raise the total effectives of the army to 340,000 men and reduce the minimum fixed by the law of 1875, namely, 125 for a company, 150 for a squadron, and 108 for a battery. The creation of a colonial army has met with approval, and to prepare for it the budget committee decided to reduce the Zouaves by 3,000 men and the Algerian sharpshooters in proportion, such large forces being no longer needed in Algeria. Gen. Mercier's plan of passing men rapidly through the army has been abandoned, and the permanent army is raised nearly to the same strength as that of Germany.

As the outcome of the affair of Capt. Dreyfus, who was degraded from the army and sentenced

to transportation for revealing military secrets to a foreign government, a bill on treason-espionage was passed on July 13 without debate. It establishes the penalty of death for the treasonable revelation of plans, documents, or information relating to the defenses of the country or its dependencies or its security against external enemies. Penalties of from three months' to five years' imprisonment, with a fine and loss of civil rights, were enacted for persons who for journalistic or other professional purposes obtain possession of or publish such papers, plans, or information.

The army estimates are increased in the budget of 1896 by 11,000,000 francs, and the navy expenditure by 1,600,000 francs. The military expenditure of the colonies has nearly trebled in ten years, owing chiefly to Tonquin and the Soudan. It is now 60,000,000 francs, while the requirements for civil expenses were estimated at 23,000,000 francs, on which a saving of 3,000,000 francs was proposed by the Budget Committee. Out of a total expenditure of 3,448,000,000 francs 2,795,000,000 francs do not admit of retrenchment, being absorbed by interest on the debt, cost of collecting taxes, and the army and navy. Of the remaining 650,000,000 francs 195,000,000 francs are required for education and 131,000,000 francs for public works. M. Ribot saw no chance for retrenchment except by reducing the civil service, which could not be done in a hurry.

The budget for 1896 introduced new taxes to provide 56,000,000 francs. Differential or progressive succession duties were expected to yield about 25,000,000 francs; a progressive duty on horses and carriages to give 1,000,000 francs; an increase from $\frac{1}{4}$ to 2 per cent. in the stamp duty on foreign companies' bonds, the duty on foreign Government bonds remaining 1 per cent., to yield 14,000,000 francs; a higher duty on full packs of playing cards, with precautions against the sale of second-hand packs, to add 1,200,000 francs; a tax on servants, farm and factory hands being exempted, ranging from 30 per cent. for 1 male servant up to 90 francs for 4 or more, with half these rates for female servants, to produce 10,000,000 francs; and the assimilation of the customs duties of Algeria to those of France to yield an extra 4,000,000 francs. M. Ribot proposed to remodel the liquor duties, but the Chamber took the matter out of his hands by voting the project of M. Vallé to do away altogether with the large revenue from hygienic beverages, such as wine, cider, and perry, and cover the deficit thus caused by an increased tax on alcoholic beverages and by a monopoly of the rectification of liquors. The tax on alcohol is raised to 275 francs a hectolitre. The change, advocated by the Socialists or Radicals, found so much favor that the Prime Minister had to accept it or court defeat. It was adopted by 294 votes to 130.

M. Cavaignac's proposal for an income tax was postponed, and the principle of the tax was rejected on the demand of the Premier by 284 votes to 223. The session was closed on July 14.

The Bourgeois Cabinet.—When the Chamber reassembled on Oct. 22, the glass-makers' strike at Carmaux furnished the Socialists with material for interpellations. A glassblower named Baudot, who was a candidate for the departmental council, left work to attend a

congress of his trade and was discharged. His fellow-workmen struck, and the manager of the glass works retorted with a lockout, dismissing 10,000 men. Troops were sent to preserve order. The strikers rejected the offer of the prefect of the Tarn to arbitrate, and kept up the strike when the manager, M. Resseguier, started the works in the beginning of October and offered to take back all except the leaders. Gendarmes were sent to Carmaux to prevent intimidation.

The Ribot Cabinet seemed to be strengthened by the results of the departmental elections, which took place on July 28. Not only had the Socialists generally failed in their novel and determined efforts to win seats, but the Moderate Republicans had gained at the expense of the Conservatives. There were elected to the departmental councils 894 Moderates, 263 Reactionaries, 181 Radicals, 74 Republicans, and 26 Socialists.

The breakdown of the transport service of the Madagascar expedition and various other evidences of administrative incompetence, with tales of peculation, gave the Opposition another weapon. The attitude of the Government on the income-tax question was not in harmony with the prevailing sentiment of the Chamber. What was most damaging was the suspicion entertained in various parts of the house regarding the complicity of leading politicians of the dominant faction in corrupt transactions, which was kindled anew by the course of the Government in regard to the Southern Railroad scandals. In the trial evidence seemed to be withheld. The Socialist Rouanet, in an interpellation on Oct. 28, accused the Government of making Magnier a scapegoat, while shielding worse culprits. His motion that the Chamber, considering that it is proper to interdict its members from taking part in the operations of financial syndicates, is resolved to throw complete light upon the affairs of the southern railways, and invites the Minister of Justice to fulfill all his responsibilities, was carried against the arguments of Ribot and Trarieux by 310 votes to 211. The ministers immediately resigned.

President Faure summoned M. Bourgeois, the leader of the Radicals, who could not induce M. Hanotaux to retain the portfolio of Foreign Affairs, but was able to make up a list drawn entirely from the Radical party. The new ministry, completed on Oct. 31, was composed as follows: President of the Council, and Minister of the Interior, Léon Bourgeois; Minister of War, Godefroy Cavaignac; Minister of Marine, M. Lockroy; Minister of Foreign Affairs, Senator Berthelot; Minister of Finance, Paul Dumour; Minister of Justice, M. Ricard; Minister of Public Instruction and Worship, M. Combes; Minister of Commerce, M. Mesureur; Minister of Agriculture, M. Viger; Minister of the Colonies, Pierre Paul Guieyessé; Minister of Public Works, M. Guyot-Dessaigne. M. Bourgeois had been Minister of Instruction and Minister of Justice, M. Lockroy Minister of Commerce and Minister of Instruction, Dr. Viger Minister of Agriculture in the Cabinet, of Dupuy and Camille-Périer, and Prof. Berthelot Minister of Education in the Cabinet of M. Goblet.

M. Bourgeois in his declaration of policy promised a supplementary inquiry into the scan-

dal of the southern railways, and a full disclosure of all documents so as to enable the Parliament to pronounce political and moral judgment. He intended to bring in a bill prohibiting Senators and Deputies from holding the office of director in any company that has a contract with the Government. It was also proposed to modify the law so as to make the preliminary examinations public. A bill for the imposition of a progressive inheritance tax was promised, with a general income tax that would correct entirely the antidemocratic inequalities in the fiscal system. Measures were also contemplated for regulating the sale and use of intoxicating drinks, providing that no taxes should be collected from hygienic fluids. The Government would present bills relating to co-operative insurance, and desired to organize a system of workmen's pensions. A definite settlement of the relations between church and state would be prepared. The economic régime was not to be disturbed, but measures would be introduced to check certain international speculations and to regulate international dealings in the stocks of gold mines.

In earnest of the intention to carry out to the end a policy of purification and expose the secrets of corrupt financial legislation the Cabinet removed M. Christophle as governor of the Crédit Foncier, and procured the arrest in London and applied for the extradition of Émile Arton, agent of the Panama corruptionists. To retain the support of the Colonial party the Cabinet was willing to modify the Madagascar treaty so as to prepare the way for annexation and colonization, and also to create a distinct colonial army. The Socialists, besides the graduated income tax, demanded a law of compulsory arbitration, and the prompt settlement of the Carmaux glass-workers' strikes. The Prime Minister promised to prepare an arbitration bill, but was not prompt enough to satisfy the Socialists or the Chamber, which on Nov. 21, by a vote of 254 to 251, resolved to consider the bill of M. Jaurès.

Anarchist Attempt.—Baron Alphonse de Rothschild, besides being the head of the great banking house and the financier of operations for the investigation of which there was a public clamor, attracted the wrath of the Anarchists and the Anti-Semites by his denunciation of their principles. A registered letter addressed to him proved to be an infernal machine when it was opened, on Aug. 23, by his secretary, M. Jaskowitz, who was badly hurt by the explosion. Two weeks later a young man named Victor Boutelle, son of a mayor under the Commune, entered the bank in the Rue Lafitte carrying a rudely constructed bomb. He was instantly seized by the detective, who got possession of the bomb and prevented the Anarchist from cutting his own throat with a razor.

Metric Congress.—The International Metric Congress, which meets every five years, was opened at the Foreign Office in Paris on Sept. 4. The ratio between the official platinum metro and the wave-length of light was confirmed. The equations of the Peruvian and the Prussian fathom were established, and the equation of the English yard was considered. Since the last session the national measures of Japan had been regulated with reference to the metric unit in 1890, and the metric system legalized in

Mexico in 1891. In March, 1895, it was applied in Tunis for measures of length and capacity and for weights, excluding all others.

The Prison Congress.—The quinquennial World's Penitentiary Congress held its sessions at Paris in the first part of July. The congress adopted the following resolutions: That manual labor must, as a rule, be made obligatory in case of penalties entailing deprivation of liberty; that prisoners have no right to wages, but it is in the interest of the state to give them on their liberation a gratuity—not at their free disposal, but to be placed in a savings bank or intrusted to some authority in the place where the discharged person is going to live, and to be used to provide for his necessities. The men should be fixed by regulation, not left to the discretion of the prison authorities. It was agreed that the limit of penal minority should be fifteen years for petty offenses and sixteen years for crimes. Resolutions were also adopted extending the control of the state over children adjudged to have acted either with or without discernment up to the age of their civil majority, the right of release remaining in the hands of the state on reasonable proof of amendment being given. The disposal of children on their release was specially assigned to aid societies. The right of a criminal tribunal to deprive unworthy parents of the guardianship of their children was also affirmed. Other principles assented to are that disabilities following a man's conviction in his own country should have effect in other countries; that the principle of cellular imprisonment should be adhered to; and that criminal lunatics should be treated in special asylums, and should not be restored to liberty except on the joint authority of the committing tribunal, the lunacy board, and the prison administration. It was decided that women ought to be treated with greater consideration than men as regards food, discipline, and prison labor. The congress refused to discuss the question of cellular imprisonment for women. It approved the principle of physical education for young prisoners, and unanimously adopted a resolution to the effect that the chief feature of physical education should be agricultural work.

The next congress will be held in Brussels.

Miners' Congress.—The sixth annual International Miners' Congress was opened in Paris on June 3. A resolution in favor of the limitation of coal production by an international agreement among miners found favor with Belgian and French delegates, but by the vote of the English and German delegates the question of checking overproduction was relegated to the next annual meeting. Only five delegates, representatives of Durham and Northumberland, voted against a legal eight-hour working day from bank to bank, and a resolution to extend to surface workers the benefits of the law obtained the same majority. With equal unanimity resolutions were passed in favor of holding employers responsible for all accidents occurring in mines.

Commerce Treaties.—A Franco-Swiss commercial agreement was concluded on June 25, and went into operation on Aug. 19. Both nations concede to each other their lowest tariffs, and special reductions are given to Switzerland.

on 30 articles, including cheese, watches, music boxes, embroidery, and spun silk. Care was taken not to concede a special tariff for articles that can be produced cheaply in Germany, forasmuch as that country under the treaty of Frankfurt has the benefit of every minimum tariff granted by France to other nations.

The twenty-years' commercial convention between Italy and Tunis was denounced by France on Aug. 19, one year before its expiration, during which time negotiations will be carried on between the French and the Italian governments for a new arrangement. The only other countries having commercial treaties with Tunis and standing in the way of its inclusion in the French customs union are Austria and England. Under other agreements made by the Bey of Tunis with the former governments of Tuscany, Sardinia, and Naples, Italians in Tunis are entitled to the treatment of the most favored nation, the French not excluded.

World's Exposition of 1900.—The Government adopted plans for the next international exposition, and made the first appropriation for it in the budget for 1896. The authorities of Nancy and some other towns protested against holding the exposition, alleging that it would disturb rather than promote business and production, that Paris alone would receive whatever benefits there were, and that, instead of promoting the export trade, it would injure it by enabling foreign competitors to watch the processes and discover the secrets of French manufactures. The Paris Municipal Council agreed to bear one fifth of the cost, this fifth not to exceed 20,000,000 francs, on condition that the ultimate profits be divided between the city and the state.

Colonies and Dependencies.—Algeria has an area of 184,474 square miles and a population of 4,124,732 persons. The population of the city of Algiers is 82,585. The military force maintained in Algeria consists of the Nineteenth Corps of the French army, numbering about 54,000 men. The revenue estimated in the budget for 1895 is 48,582,981 francs, of which 13,160,531 francs come from direct taxes, 11,440,500 francs from customs, 11,689,150 francs from other indirect taxes, 5,148,600 francs from monopolies, and 3,096,300 francs from forests and state lands. The expenditure is estimated at 73,851,842 francs, of which the chief items are 33,252,000 francs for public works, 15,208,007 francs for collection, 11,726,837 francs for the interior, 2,747,450 francs for justice, and 1,841,190 francs for agriculture. The total value of the imports in 1893 was 239,698,385 francs, of which 184,754,222 francs came from France; of the exports, 192,628,131 francs, of which France took 148,213,270 francs.

Tunis is nominally a dependency of Turkey, but since 1881 has been administered by France as a residency or regency, the minister resident receiving his directions from the Minister of Foreign Affairs. The present French resident is René Millet. The titular ruler is the Bey Sidi Ali. The area is about 45,000 square miles; the population 1,500,000. The French residents number 42,000. The estimated revenue in 1894 was 23,231,000 francs; expenditure, 23,154,000 francs. The chief exports are wheat, barley,

olive oil, tan, sponges, wine, vegetables, anchovies, and sardines. The fisheries and some branches of agriculture and trade are carried on by Italians. The total value of imports in 1893 was 38,383,225 francs, and of exports 29,685,325 francs. The city of Tunis was converted into a seaport by the cutting of a ship canal, completed in 1893, from Goletta, 10 miles away. In June, 1895, the landlocked harbor of Bizerta, until then closed by a sand bar, was opened as a military harbor, in which the whole French Mediterranean fleet can take refuge.

The French Congo and Gabon have an area estimated at 300,000 square miles, with a population of 6,900,000 natives, and the area of Senegal, the Guinea territories, and the French Sudan is estimated at 550,000 square miles, with a population of 3,000,000 or 4,000,000. On the eastern side of Africa France owns only the naval station of Obok, at the entrance of the Red Sea, with a population of 22,370 and an extent of 3,860 square miles. By a boundary settlement with Great Britain, both countries agreed to respect the independence of Harar, which country has since been included in the sphere of influence claimed by Italy. The claim England has acknowledged in a convention with Italy, but France disputes it. Off the eastern coast of Africa France has long possessed the island of Réunion and the Comoro Islands and Mayotte, producing sugar and serving as outposts in the conquest of Madagascar, which has been contemplated for centuries and was finally achieved in 1895.

French Indo-China, embracing Annam, Tonquin, Cambodia, and Cochin-China, has an area of 188,000 square miles, not including about 100,000 square miles east of the Mekong that was annexed to Annam in 1893; the total population is 18,691,000. The protectorates of Annam and Cambodia have their own governments, with King Than Thai at the head of one and King Norodom chief of the other. Cochin-China is a French colony, represented in the Chamber by one Deputy. Tonquin is a protectorate, administered under the supervision of French officials. The Governor General of Indo-China has control over all.

The four dependencies are united in a customs union. The total imports in 1892 were 68,650,878 francs; exports, 95,071,570 francs. Not more than a quarter of the trade is French. The exportable products of Annam are sugar, cinnamon, and dyes; of Cambodia, rice, betel, tobacco, cotton, beans, and fish; of Cochin-China, rice, cotton, hides, fish, pepper, and copra; of Tonquin, rice, sugar, silk, cotton, tobacco, pepper, oils, iron, copper, and animal products. Rice is the chief crop of Tonquin and Cochin-China. It is exported to China. The local revenue of Cochin-China is about 31,250,000 francs; 4,690,000 francs were assigned in 1895 to military expenditure in Annam and Tonquin, while France expended in Cochin-China 3,051,000 francs. The local revenue of Tonquin in 1892 was 3,000,000 francs, while the expenditure of France in Tonquin and Annam was 26,250,000 francs. The number of soldiers maintained in Tonquin in 1893 was 18,555, of whom 6,500 were native troops. A railroad, 64 miles long, from Phulang-Thuong, 30 miles

north of Hanoi, the capital, to Langson, 20 miles from the Chinese frontier, was completed in December, 1894. It took over four years to build, and cost more than 18,000,000 francs. The export trade to Yunnan in 1892 was 4,990,000 francs, and the imports thence amounted to 3,180,000 francs. The regular subsidy for Annam and Tonquin has been 10,000,000 francs, but this was increased in 1895 to 15,000,000 francs. A loan of 25,000,000 francs was required to pay for the railroad 12,000,000 francs for the sections not yet built, and 13,000,000 francs for the part already constructed.

In America France possesses Cayenne or French Guiana, a penal colony having a sedentary population of 25,000, besides 4,400 convicts; Guadeloupe and Martinique and the fishing stations of St. Pierre and Miquelon, near the Newfoundland banks.

The French possessions in the Pacific are New Caledonia, with its dependencies, and the Society Islands, with the smaller groups of Marquesas, Gambier, Tuamotu, and Tubuai, and the island of Rapa. New Caledonia has an area of 6,000 square miles and 62,752 inhabitants, of whom 1,477 are convicts, 2,515 liberated convicts, 3,476 officials and soldiers, 5,585 colonists, 1,825 contract laborers, and 41,874 natives. The expenditure of France in 1895 was 3,980,451 francs; the local revenue in 1893 was 2,890,024 francs. The chief products are nickel, preserved meat, skatone ore, and silver-lead ore. Tahiti, the chief of the Society group, has an area of 412 square miles and 11,200 inhabitants. The products of these islands are copra, pearl shells, santon, and vanilla.

FREE BAPTIST CHURCH. The "Free Baptist Register and Yearbook" for 1896 gives statistics of this Church, of which the following is a summary: Number of quarterly meetings, 197; of churches, 1,540; of ordained ministers, 1,362; of licensed preachers, 212; of members, 85,504; value of church property, \$2,661,409. Amounts of contributions reported: For foreign missions, \$17,239; for home missions, \$12,594; for the Education Society, \$32,017; for the Woman's Missionary Society, \$22,232. The current accounts of the Foreign Mission Department for 1895 were balanced at \$31,464; the total amount of the 4 invested funds was \$52,621. The society returned from its mission in India 559 resident and 170 nonresident members, 38 additions by baptism during the year, 2,793 pupils in Sunday schools, and a native Christian community of 1,319 persons. The Home Mission Department had received (including the balance of \$1,191 from the previous year) \$14,446, and returned the amount of its two invested funds as \$13,118. The receipts of the Educational Department for 1895 were \$21,135, and its four invested funds amounted to \$8,607. Thirteen educational institutions—universities, colleges, classical schools, and high schools—are maintained.

The General Conference met at Winnebago City, Minn., in October. President George F. Mosher, of Hillsdale College, Mich., was chosen president. The General Conference Board reported that, its first year having been occupied largely with the transfer work and accounts from the several special boards, it had had but one year of active operation. A constitution

had been adopted, an executive committee appointed, an apportionment of \$50,000 made (to be raised by the churches), the starting of new enterprises without the consent of the board or the Conference discouraged, and a resolution adopted that the invested funds should never be used for current expenses or infringed upon in any way. The total receipts for home missions were given as having been \$13,846; for foreign missions, \$24,392; for education, \$21,135. In three years \$813 had been received on a "two-cent tax." The field secretary made a report of his work in behalf of the board, to stimulate the interest of the people of the Church in the enterprises and causes under its care. A "correspondence school" was reported upon as meeting the need for which it was organized—the diffusion of knowledge on biblical and theological subjects by correspondence—was received and adopted, and officers were chosen for it. A resolution proposed by the Committee on Church Polity urged the ministers faithfully to follow in practice and teach the principles of the denomination and its polity from the pulpit and in their pastoral relations. The report on "Our Country" included a resolution inviting practical effort on the part of the Government to devise some effectual means of restraining vicious foreign immigration, and an expression "in the interest of justice, temperance, reform, and the possible purification of political methods," of "both municipal and national enfranchisement of women." The action of the Conference respecting the young people embodied a direction that each Young People's Society appoint a committee whose duty it shall be to present from time to time all matters of denominational interest as learned from the denominational publications; a recommendation that the societies seek out young men looking to the ministry and encourage them to consecrate themselves to it and prepare for it; and urging members of the society to exercise themselves in securing a pure ballot and true manhood in the duties of citizenship. A report on doctrine adopted by the Conference declared

That the scriptural doctrine of the Christian Church should be more carefully studied by our ministry and presented to our people—to wit, that the Church of Jesus Christ includes all persons who have been born of God through repentance toward God and faith in the Lord Jesus Christ, and no others; that members of the local church need in all cases be members of the Church general, and then enter into fellowship by agreement to accept the rules and regulations and by vote of the local Church respectively, and that the ordinances of the Gospel, baptism, and the Lord's Supper should be observed by all members of the universal Church, and by no other.

The Conference further emphatically declared "that baptism by immersion should be required of all candidates for membership in Free Baptist churches."

The action of the Conference with reference to ministers directed the ministers' conferences of the several yearly meetings or State associations to require from all ministers within their bounds annual reports of their work and their fellowship with the ministers of the Conference, and to issue annual certificates of standing to them. A graded course of study was provided for, of not less than three years, to be required

of all candidates for ordination and for the renewal of licenses; all licenses to be of three grades, to be known as primary, junior, and senior licenses, to be obtained on giving satisfactory evidences of proficiency in the studies of the course corresponding to them. Resolutions were passed recognizing the value of evangelistic work by properly accredited workers; declaring no political party worthy of support that fails to commit itself unequivocally for the prohibition of the liquor traffic; discountenancing the use of tobacco in any form; reaffirming "allegiance to the system of public schools as founded and maintained by the State for the help and instruction of all the citizens"; and pledging resistance to "every attempt, direct or indirect, to divert any of the common-school funds for the profit of sect or denomination."

FRIENDS. The following statistics of Friends in America for 1895 are given by Rufus M. Jones in the "Independent," of New York: New England Yearly Meeting, 4,389 members; Philadelphia, 4,513; New York, 3,808; Oregon, 1,777; Canada, 1,064; North Carolina, 4,998; Wilmington (Ohio), 5,099; Ohio, 5,084; Iowa, 10,642; Western (Indiana), 15,195; Indiana, 18,182; Kansas, 10,583; Baltimore, 1,122; California, 1,202; Friends in Mexico, 500; total in America, 88,158; number reported in 1894, 87,466; increase in 1895, 692.

A new yearly meeting was opened in California in the spring of 1895, making the fourteenth independent body in America. The opening was attended by delegates from nearly all the other American yearly meetings.

The bicentennial anniversary of the New York Yearly Meeting of Friends was celebrated at Flushing, N. Y., May 29. Both divisions of the Friends, the orthodox and the "Hicksites" united in the observance. It had been intended to hold the meeting in the old meeting house, erected about two hundred years ago, but the attendance was too large to be accommodated in it, and another room was secured. Besides a number of elderly persons, direct descendants of the Friends who settled at Flushing two centuries ago, Miss Caroline Hicks, a great granddaughter of Elias Hicks, founder of the "Hicksite" division, was present. The historical address was delivered by James Wood, who traced the Quaker settlements from Gravesend, Long Island, to Flushing, thence to Westchester County, New York, and the adjacent islands of Connecticut, and then northward between the Dutch settlements along the Hudson and the English in New England, even into Vermont, while some migrated as far north as Canada. Aaron W. Powell read a paper on "What Friends have done for the World," and Marianna W. Chapman delivered an address on "The Position of Women in the Society of Friends." The exercises closed with the reading of a poem by Mary S. Kimber on "The Old Friends' Meeting House."

The sessions of the London Yearly Meeting were held in the third and fourth weeks in May. Connected with them were home and foreign mission meetings and meetings in support of temperance, against vivisection and the opium trade, in the interests of education or of special schools, and the annual meeting of the Friends' Provident Society. The statistical reports
